JOHN CRERAR LIBRARY

"Everywhere the cowboys made themselves manifest, clad now in the soiled and dingy jeans of the trail, then in a suit of many-buttoned corduroy, and again in affluence of broadcloth, silk hat, gloves, cane, and sometimes a clerical white neck-tie. And everywhere, also, stared and shone the Lone Star of Texas—for the cowboy, wherever he may wander, and however he may change, never forgets to be a Texan, and never spends his money or lends his presence to a concern that does not in some way recognize the emblem of his native State; so you will see in a town like New Sharon a general pandering to this sentiment, and lone stars abound in all sizes and hues, from the big, disfiguring white one painted on the hotel front, down to the little pink one stitched in silk on the cowboy's shilling handkerchief. Barring these numerous stars, the rich lights and the music, we missed sight of any special efforts to beguile or entrap the passer-by—perhaps because we were not looking for them; nor was there, for some hours, a sound to reveal the spirit of coiled and utter vileness which the cheerful outside so well belied. It was in the main much the kind of scene one would be apt to conjecture for an Oriental holiday. But as the night sped on the festivities deepened, and the jovial aspect of the picture began to be touched and tainted with a subtle, rebuking something, which gradually disclosed the passion, the crime, the depravity, and really vivified and swayed it all, and made it infernal. The saloons became clamorous with profanity and ribald songs and laughter. There were no longer any promenaders on the sidewalks, save once in a while a single bleared and staggering fellow, with a difficulty in his clumsy lips over some such thing as 'The Girl I Left Behind Me.' An inflamed and quivering fierceness crept into the busy music. The lights paled, flickered, and here and there went out. Doors were stealthily closed, window-shutters slammed to with angry creaks. And at length, as we looked and listened, the sharp, significant report of a pistol, with a shriek behind it, was borne toward us from a turbulent dancing-hall to certify its tale of combat and probable homicide, and to be succeeded by a close but brief halt in the noisy quadrille, presumably for the removal of the victim."

Newton made a bid for this business, and the early days of cattle shipping from that point were marked by an exceptional amount of trouble and disorder. With 1872 came the opening up of the Santa Fe Branch along the Arkansas River Valley, and Wichita, then a town of two thousand inhabitants, also received for shipment many thousand head of cattle. This was fifteen years before the great boom and the advertising to the world of the fact that Wichita was the Peerless Princess of the Prairie. The little town appeared to be exceptionally well adapted for the trade, and even before the railroad reached it arrangements were made to ship cattle from it. Those that remained out of the disastrous wintering-over experiment of the winter of 1871–72 were driven to various points, and many of them to Wichita, from which seventy thousand head of cattle were shipped very soon after the stock yards were opened. Fort Harker, sixty or seventy miles west of Abilene, also came into prominence during 1872 and 1873 as a shipping point, and there was a general revival of cattle driving to Western Kansas.

In the table published at the opening of this chapter the cattle drive of 1873 is placed at four hundred and four thousand. Mr. McCoy's estimate for the same year is four hundred and fifty thousand. The 1872 figures in the official return are three hundred and fifty thousand, with which the pioneer shipper agrees. The season of 1872, while it did not approach that of 1870, was a vast improvement on 1871. The corn crop in the Northwest was a very heavy one, and as the outside demand for corn was not great, cattle were bought in large numbers and taken North for feeding. The comparative success of the 1872 drive led to a marked increase in the number of cattle driven in 1873, when, as we have already seen, four hundred or four hundred and fifty thousand head of cattle entered Western Kansas. In addition to this there were fifty or sixty thousand head which went farther East in search of shipping points, making a possible total for 1873 of nearly half a million. About three-fifths of this number were cows, heifers and steers under four years. Three railroads were now competing for the traffic which was no longer sneered at. Indeed, Mr. McCoy tells us that during 1872 and 1873 one railroad company alone, which in preceding years had shown a disinclination to handle the cattle traffic at all, distributed large sums of money to get that traffic away from rival roads.

Had the drive of 1873 been of anything like average proportions, the year would have been a fairly prosperous one, as the bulk of the stock would have been marketed before the panic occurred. As it

was, however, the preponderance of farm or stock cattle over fat beasts came well-nigh ruining the cattle trade altogether. The scare about Texas fever naturally made buyers a little timid in regard to this class of cattle, and instead of an army of buyers appearing and competing for the choicest lots and bunches, very few buyers came at all. Dispatches were sent in various directions only to be ignored, or to bring forth replies that all wants were supplied.

Something like a feeling of horror resulted, and the disaster of 1871 was repeated, and tens of thousands of cattle were found begging for buyers at Western Kansas points. Many of the larger drivers succeeded in making contracts whereby the animals were driven to the Indian Territory. Other bunches were fattened locally, and it became necessary to borrow money in large amounts. Just as the money thus borrowed fell due the great panic of 1873 commenced in Eastern cities, and by October the business of the country was practically paralyzed.

Never had there been so many cattle awaiting buyers and shipment, and never had the demand been so absolutely nominal. The banks which had loaned money for the purpose of carrying the cattlemen were themselves pressed, and were compelled to call in the loans. Cattle were, in consequence, put upon the market without reserve, and although it is estimated that there were only about one-fourth the number of buyers that had appeared in 1872, twice the number of cattle were forced on the market during the early fall. Mr. McCoy estimates that the panic cost the Texas drovers another two million dollars, and that scores of men who had hitherto paid dollar for dollar were bankrupt. Animals by the thousands were sold for their hides, horns and hoofs and for the tallow they would produce, the flesh being thrown away as superfluous.

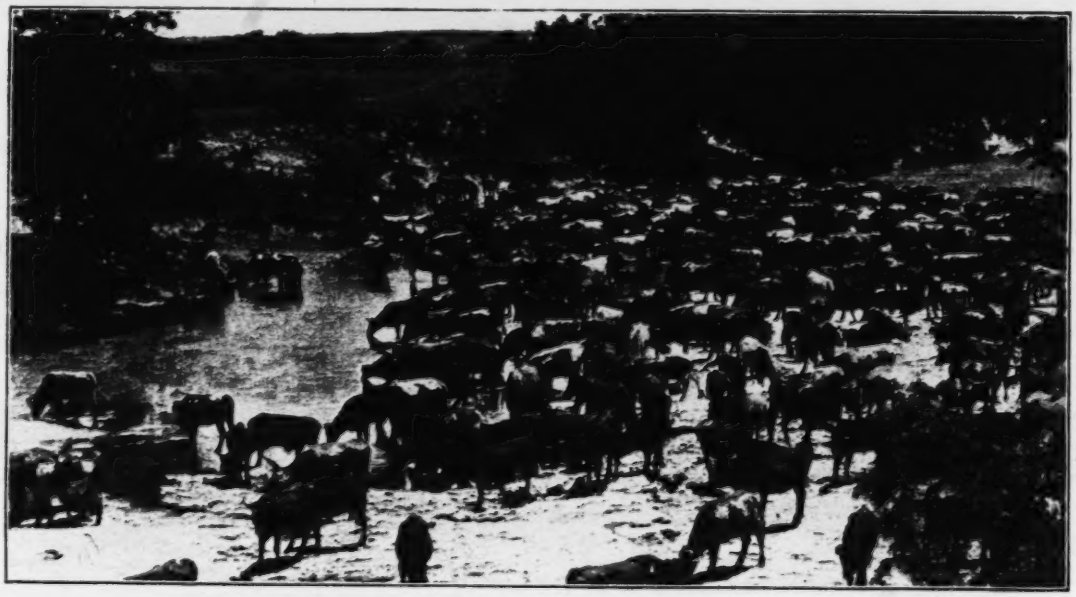
Pages could be written on the moral of this calamity, and on the lesson it taught as to the valuelessness of the most valuable products when there was no demand for them. Many men declined to sacrifice the product of their labor and capital in this apparently sinful manner, and shipped their stock East with instructions to force them for sale on their arrival. From a financial point of view, those who did this fared worse than those who disposed of their stock to the tankers. A gentleman who is now engaged as a commission man was one of those who shipped to his sorrow. The circumstances were almost painful.

"I had five thousand head of cattle at three points in Western Kansas ready for shipment," said the ex-cattle feeder. "They were fairly good stock, and ought to have yielded me a profit of at least ten dollars a head, even in medium bad times. A friend of mine in Chicago made inquiries at my request, and notified me that if I shipped on at once I should realize prices which would leave me at least a reasonable profit. I flatter myself that I did not anticipate any such a happy result, but I certainly thought, judging from my friend's figures, that I could about come out even and have a little money with which to start in again the following year. I accordingly shipped, laying out my last dollar in expenses, and borrowing a great deal more into the bargain. I never slept a wink on the way to Chicago, and when I arrived there I saw that I had not worried any too much. I was asked a dozen times in half that number of hours what on earth I had shipped for, and when at night I compared the various offers I had received I began to ask myself the same question, and to feel an intense desire to take myself into some obscure locality and kick myself a few times for being a fool. I held off a day or two with a kind of a vague hope that things would get better, or at least that they could not get worse. But on the third day the papers were full of reports of bank failures and suspensions, and the offers made me on my first arrival were all repudiated when I tried to close with those who had made them. When I finally got rid of the bunch I found I had lost money on the shipment. This sounds incredible, but it is a fact. Three of my purchasers failed before settling time, and what little money I had left was barely enough to pay what I had borrowed for shipping expenses. If ever a man was flat on his back I was that man, but my losses were small compared with some others, who lost heavy fortunes during that terrible fall."

About two hundred thousand cattle were placed in winter quarters in Kansas after the panic. There was very little hope of doing much with these animals, but there was just the possibility of a better demand the following year, and accordingly the heavy expense was incurred. Some few were driven to the Northwest, and various schemes were adopted by those who were not absolutely ruined by the panic and the glut which came side by side.

The success of the wintering experiment was not marked. As much hay as possible was secured by those who had money with which to buy it, or credit with which to obtain it. Temporary dugouts and stockades were put up, and the cattle eat hay with avidity, and did fairly well. In the extreme west of the State the cheaper method of wintering the stock on dry buffalo grass was adopted, and those who selected Eastern Kansas made more use of corn stalks and other produce. Just as the arrangements for wintering were complete the cattlemen got together with a view to discussing the situation and seeing what could be done to remedy it. Mr. McCoy reports at some length the mass meeting of live stock men at Kansas City, where a banquet, almost funereal in character, was given. The object of the gathering was to get together the cattlemen of the North and the South, and try to establish an association in their joint interest.

Eleven years later the cattlemen met in Convention in St. Louis and heralded their prosperity to the four wings of heaven; but in 1872 they met rather to condole than to congratulate. Some of the men at the banquet were almost crazed with grief and chagrin, and some amusing stories were told of



WATERING ON THE CONCHO.—From Photo by Ragsdale, San Angelo, Texas.

how the men acted. The majority, however, were there for business only, and as a result the Live Stock Men's National Association came into existence. Of this association, Mr. John T. Alexander, of Illinois, was made President, and Mr. McCoy, Vice-President. Matters grew so much worse instead of better just after its formation, that it lay in abeyance for some time, and never really assumed the proportions anticipated, although it is but fair to say that it paved the way for the larger association which followed it, and more especially the great Convention to which we have already alluded, that of November, 1884.

Mr. McCoy's remarks on this gathering and on the cattle situation, as the panic of 1873 found it, are so perfect a likeness of trade as it then existed, and so superior to anything else that has been published on the subject, that we reproduce them, merely commenting on the fact that in many respects Mr. McCoy proved himself to be a prophet as well as a close observer of human nature, and especially of the cattle trade. "It is a fact," he wrote, just after the panic, "that almost every other branch of business or occupation, although not of one-half the magnitude nor employing a fourth as many men as the live stock business, is organized completely, and by such organization aids and protects its members in a thousand ways, besides collecting statistical and other general information concerning their special business, as well as protecting their co-laborers from oppression and outrage at the hands of strong monopolies, with which they are often individually brought into business relations. It is true that live

stock men are, or have been heretofore, entirely unorganized, and as a result thereof, they are not correctly informed as to the extent or magnitude of the business in which they are engaged; nor do the stock men of one State, as a class, or as a rule, have any definite knowledge of the number engaged in like business in any other State or Territory. This might be truthfully said of most stock men, as to their adjoining counties, and often townships. Nor do they know, or have any good means of informing themselves, as to the number of live stock, hogs, cattle or sheep that are being prepared for market, or that are likely to be put upon the market at any given time in the future. And when they are prepared, or ready to market their stock, they accept the nearest and most convenient means of transportation, even if asked exorbitant rates of freight, yard charges, feed charges, commissions, and other incidental expenses to which the business is inevitably subjected.

"It would be next to impossible for railroads to effect and maintain combinations which the stockmen could not break. Corporations, by combination, would not then successfully put up and maintain the price of freight fully thirty-three per cent over rates charged previous years, and that, too, when live stock is selling at prices ranging from twenty-five to fifty per cent below those realized in former years. No such outrage could, or would, be attempted or tolerated, if live stock men would act in concert to obtain what they desire, and of a right ought to have; neither could stock yard companies insolently mistreat and abuse live stock or charge exorbitant and outrageous prices for yardage, hay, corn, or for other services rendered; they would not dare to do it. But as matters now stand, the live stock men, entirely unorganized, each one by himself and for himself only, are subjected to the arbitrary restrictions and extortionate charges of conscienceless corporations. A stockman or shipper sees himself wronged, and his stock abused, neglected and otherwise mistreated, but feels himself powerless as to remedies, and usually does nothing but mutter curses, not loud, but deep; then pass along, only to have the same outrages repeated as often as he attempts to go to market.

"The only remedy suggested to me for these and many other abuses and grievances is in organization. Then a potent protest, that could and would be enforced and respected, would issue against offending parties, and they be compelled to do right and act fairly with their patrons; or, in the event of their persisting in oppressive practices, such retributive justice could be meted out to them as would compel a change in their conduct and manner of doing business; or the business would be entirely taken from them. Again, if the stockmen were properly associated together, a statistical bureau would be established for gathering and disseminating such information as would enable the members of the association to form correct estimates as to the amount of stock in every section of the country, and the probable number that would be marketed each month of the year.

"It is not difficult for the practical cattleman to see wherein such information would be of inestimable value in forming business calculations and correct judgment of the probable future status of the business and markets. Besides, a great aid to both buyers and sellers would be thus created, and a general business register of the wants or desires of live stock men would exist, to which any member might refer at his pleasure, and thus save much time and money, which would otherwise be spent in rambling over the country seeking, without knowing just where to look, for that which he desired. The advantages of organization or association are so numerous and so great, that it is time spent idly to urge them upon the attention of thinking, discerning live stock men. But, if they continue to bear without effort to remedy the many evils, abuses and extortions which have been heaped upon them in the past, then are they degenerate dung-hills, and unfit to bear the proud distinction to which, as a class, they aspire.

"But we hope and apprehend the day is not distant when there will be found organizations of live-stock men in every State and in many counties, all of which may be made auxiliary to a general or national association. When that day does come, live stock men will be subjected to fewer losses and be able to conduct their business in an intelligent, systematic manner, just as in every other industry or vocation in the United States. It is in no sense for the lack of intelligence among stockmen that effectual organization has not before been effected, but from a habit of doing and acting in an independent individual capacity. The benefits to accrue from association are not thought of nor realized; but the day now is when their numbers and their interest alike behoove them to organize for their own mutual benefit, information and strength."

In the next chapter we shall have occasion to deal more with the question of association between different interests among cattlemen, and the hopes and possibilities connected with fusion and amalgation. Before doing so we have to consider and trace as nearly as we can the circumstance connected with this exceptionally dark period of the history of the cattle trade, and the way in which light gradually dawned on the horizon as a harbinger of the good times which finally came. The history of the cattle trade of the South and Southwest, and of the United States generally, is one of cycles, and it is of the worst side of one of these that we are now treating.

All things seemed to conspire together for the injuring of cattlemen and cattle at this period. There was not the abandoning of herds in the way that prevailed during the war, but, in some instances, there were catastrophies bordering very closely upon it. One of the calamities of this kind has much of the wierd and unnatural about it, and arising out of it there still continues a condition of affairs which seems almost incredible. This is the existence of a herd of cattle on a ranch which is practically a prison, and from which there is no available means of escape or exit. The cattle number one thousand or more, and are said to be fat and sleek; but they are in a position more anomalous than that of fish out of water.

The scene of this wonder is in Utah. The ranch is oblong in shape, and along the two main sides there arise precipitous cliffs, to climb which is impossible. At each end rushes the Yampa River in its circuitous and temptuous course, and thus on all four sides the cattle are hemmed in, their prison being a fortress of the most amazing type. The story of how these cattle got in this natural jail is even more interesting than a description of the prison itself. At the time when the cattle trade was in the very depths of its adversity, or about twenty years ago, the Danites, or Avenging Angels of the Mormons, were being driven into the wilderness by the Government troops. A few of those who had been the blindest followers of Lee, the Mormon fiend incarnate, whose hands were red with the blood of women and children, found in their wanderings a pretty valley or stream, which flows from the Wasatch Range into the Green River.

They stuck their stakes, built their camp-fires, and during the night their sagacious leader had a vision which told him there to stay. They could hardly have chosen in all Utah a more fertile or more isolated spot. They called it Ashley, and about them have since gathered more of their sect, until where the refugees posted their pickets on the lonely nights of the first summer has grown a thriving village. It is one hundred and forty miles from the Union Pacific Railroad south, and a hundred and forty-five miles north of the Rio Grande Western. Until within a few years past it has been isolated entirely, but now it is but thirty miles from the Ute Reservation, and furnishing supplies for the agency forms quite a business for the community.

It was a tenet of the Danites that robbing or theft from a Gentile was no crime. So it was thought to be only a cunning trick when John Wyckliffe, one of the Mormon settlers of the new town, and his three sons made a night sortie on Henry's Ford, in Wyoming, and carried away eight hundred head of cattle ranging there. This was in 1874. The owners of the cattle discovered their loss a few days after they were gone and started in pursuit. The Wyckliffes had their friends along the trail, and were warned by signals of the coming of the pursuing party. Accordingly, they drove the cattle as fast as they could travel on eastward, across the Green River and up along the Bear, with the intention of reaching the Elk Mountain country, in Northwestern Colorado, where they would be practically safe from detection, and their stock also could secure the most succulent food.

The thieves and the stolen herd had reached the mess of inviting grass at sundown one day, and halted to camp for the night. A terrific storm arose. The lightning flashed incessantly, and the thunder pealed and cracked with unintermitting fury. The four men desperately held the terror-stricken cattle by riding around them constantly and chanting some weird tune. But the wild fearfulness of the furious storm excited the brutes beyond measure. They surged and ginned, every moment growing less subject to control. All at once, as if by one mad impulse, they stampeded.

A stampede of cattle by day is calculated to strike terror to any heart, lest there should be some human being in the pathway. A stampede by night, and during a furious thunder storm, with the lightning revealing the huge mass of frenzied brutes hurling itself on like a living catapult, frantic with fear, and as resistless as the storm itself, is one of the grandest and most appalling spectacles. All

the mad might of frenzied animate force is aroused; and self-destroying, as well as destroying all in their way, they rush on until they fall dead-like or plunge into some abyss.

John Wyckliffe and his sons met their fate amid the lightning's glare and the thunder's roar. They endeavored to head off the stampeded herd. Instead, they and their horses were swept on, and driven, in the terror to escape the charge of the maddened animals, over the brink of the awful precipice which frowns up from the waters of the Bear. After them plunged the whole fright-crazed herd, and down to the bottom of the fearful fall went horses, riders and horned creatures.

Out of this plunge of life, to what was seemingly certain death for all, a few of the herd were not killed. Those which had gone ahead had formed a cushion of death. Maimed, stunned, but still invested with a spark of life, when the dread storm was over, the living cattle crawled out from the mass beneath them and formed a nucleus for the herd which now roam at will within their rocky confines. On the bank of the river, stretching back a few hundred yards, grow succulent grasses, and upon this the cattle have propagated and thrived. In looking over the edge of the precipice, one can see that they are small and as wild and as agile as a deer. They have been shot at to see the effect, and have learned to regard the appearance of a man, whether Indian or white, as a menace from which they flee, clamoring over rocks and through underbrush in the chase to a point of concealment.

The place where the thieves and their horses and the herd fell is plainly marked by a pyramid of bones which rise to the height of thirty feet. The ghastly reminder and relics of the human and animal victims of the terrible leap shine forth white and glistening when the sun is high and reaches that spot with its full glare. The progeny of the surviving animals from the fall are fat and sleek, though, and have their sunny beds, deer-like, where they lie for warmth in the winter, and to them the monument of skeletons is no source of disquietude. There is no fierce mountain lion or more dangerous bear, nor, in fact, any other animate thing within this cow-garden of Eden. As yet, too, no man has been able to reach or disturb them.

This story, so romantic in character as to almost challenge its accuracy, is merely given as an illustration of the difficulty of the times. Troubles, Shakspeare aptly tells us, come not in singles, but in battalia, and it seems as though this were the case even more than usual in the cattle industry twenty years ago. Had not the men connected with it been blessed with back-bone of abnormal character, the condition of affairs would have been very serious, and the country would have been taught a lesson which, perhaps, would have done it good, although it would have also subjected it to inconvenience and even famine. The work done by the cattlemen in supplying the needs of a race of beef-eating people has never been appreciated at its full worth, and had the men, whose prospects were blighted by the panic of 1873 and the absolute dearth of business in 1874, given up in despair and turned their attention to some other mode of livelihood, there would have been a shortage in the cattle supply, the extent of which few people have stopped to inquire.

This calamity was averted by the stern, business-like activity of the cattlemen. It is not quite true that a man who was once a cowboy never leaves the prairie for town life. On the contrary, some of our best-known bankers and commission men graduated from the open prairie and from the wild, unfenced ranch. At the same time, there is something about blue grass and open country which cements the affection and regard of those who have earned a living upon it, and hence it was that the boys stuck to their lasts, to use a common trade expression, when there was every reason to fear a stampede in some other direction. The opening up of immense tracts of country for stock purposes in the extreme West, and particularly in Wyoming, Northeastern Colorado and Northwestern Kansas, acted as a safety-valve in time of danger, and the development of the stock-raising industry in these sections proved of incalculable value.

The belt of country along the line of the Rockies, over a thousand miles long and four hundred miles wide, is so admirably adapted for cattle-raising purposes, that, as the panic subsided, attention began to be turned to it in proper ratio, and this as much as anything else helped to bring about a speedy turn in the cycle and a period of prosperity. Many a man gathered together what little he had left out of the wreck and fed cattle in this wild region, where he succeeded in making a new start in life. In 1873 one herd of eleven thousand cattle was driven west from Texas in the manner described, and there were many other instances of even a larger character. In Colorado the stock-growers

organized at an early date, and their association proved to be of immense value. Many thousands of cattle were recovered after they had been stolen, and in some instances the consent of the Governor of New Mexico had to be obtained in order to enable the hunters after stolen cattle to cross the border line and recover it for the benefit of the actual owners.

In Northwest and Western Kansas the industry also obtained an impetus after the calamities recorded. Mr. McCoy records, with much interest, the location of the Victoria colony by English and Scotch capitalists. The colony was located along the line of the Kansas Pacific Railway, and was well watered and exceedingly well adapted for its purpose. Thoroughbred cattle were imported in large numbers, and it was found that beasts could be cared for an entire year at a cost of about two dollars per head. A large number of Galloway stock was placed on the ranch, and here, as elsewhere, the results of the importation of better blood proved exceedingly successful.

New Mexico also found grazing ground for thousands of head of cattle for which no market could be found in consequence of the panic. This vast Territory offered every facility for cattle raising, with the single exception of the fact that there were too many sheep, and always have been, to please the average cattleman. But New Mexico and Southern Colorado received many thousand head of cattle at the time we are speaking of, and although there were many difficulties to be overcome, there were, also, great successes, many men making quite a considerable fortune out of the work. Nevada grazing grounds were also used in the same way, and thousands of Southern cattle were driven on to them. Still larger numbers went to Wyoming, and others found temporary resting places in the Indian Territory. Various estimates of the number which were placed in different parts of the Indian Nation during the fall and winter of 1873 have been given. The total was certainly away up in the hundreds of thousands, and as a safety-valve it proved of inestimable worth until the Government put a stop to the grazing of cattle in Oklahoma and the Cherokee Strip, in response to a demand for increased land for the homeseeker and "boomer."

These facts, combined with other influences we shall try to trace, helped the industry back into prosperity. The growth in the foreign export trade was an important factor, and about the year 1876 its influence began to be felt to a very remarkable extent. Enterprising Eastern capitalists, discovering the fact that there was money to be made out of this business, commenced slaughtering cattle in the Western markets and shipping the carcasses to Europe. Improved shipping and carriage facilities aided this movement, and, after a very few months, its influence began to be apparent. Live cattle were at first shipped, but the importing countries were hampered by agitations in behalf of home agriculture, and before long dressed beef took the place of live animals. The canned-beef industry also led to a heavy demand, and prices, which had been very low, commenced to spring up rapidly. The early eighties saw them abnormally high, and the excessive prices of 1881 and 1882 will not soon be forgotten. Those who had stuck to the trade in spite of discouragements had their reward and made fortunes far greater than those they had lost.

Four years before high-water marks and records were made in prices there was a perfect revolution in the trade. It began to be breathed abroad that there was money in cattle. Hundreds of thousands, and indeed millions, of dollars were withdrawn from other investments and diverted to Texas and the Southwest. The demand for breeding cattle was tremendous, and every one who could get a ranch did so immediately. The activity was most marked in Texas, the Indian Territory, Wyoming, Arizona, New Mexico and Colorado, and these States and Territories vied with each other in enterprise and activity. Early in the eighties there was a distinct scarcity of young stock, and especially of heifers. The short corn crop of 1881 was one of the many things which conspired for the good of the cattle industry, and the open winter which followed was equally advantageous. The Western States and Territories were able to winter their cattle in good condition and at trifling expense, while in the Eastern and older States the conditions were far less favorable.

For two or three years there has been a heavy drain on native cattle, high prices having tempted the marketing of immature stock. The spring of 1882 found an absolute shortage in the market, and this time the panic hit the other fellows and helped the cattlemen. Those who had raised fat cattle on buffalo grass found themselves in clover. Nine cents a pound gross was freely paid in the great markets, and cattle were shipped in with great rapidity and much eagerness. Everything was rosy and

delightful, and many a handsome fortune was made by men who, less than ten years before, had been almost in the depths of despair, with ruin staring them blankly in the face.

It is usual to condemn corporations on general principles, and to speak of trusts very much in the same tone as of small-pox or diphtheria. In the cattle trade this has been the case quite as much as outside of it, and the Big Four has come in for a great deal of vigorous condemnation. That it has combined to keep down prices during recent years, and done a great deal to injure and hamper the cattle raiser, can scarcely be denied; but it is fair to remember that this combination helped materially, in its component parts, at any rate, to bring about the condition of affairs which we have described. The millions of money introduced into the business made it possible to provide the ice houses, refrigerator cars and other requisites for carrying on the business of shipping dead meat; and the success of the Big Four, while it has meant the ruin of many others, has to a considerable extent helped a good many more.

To another class of corporations immense credit must be given in the matter of the great revival of the cattle industry during the eight or nine years which followed the panic. Some people say that the railroads encouraged the fencing in of ranges, and others assert that the fencing in of ranges encouraged the building of railroads. This is a point concerning which we are not compelled to express an opinion or advance an argument. But it is a fact, nevertheless, that under existing conditions, and especially in these days of fences, cattle raising would be well nigh impossible without the admirable railroad facilities now provided.

During the time when every cattleman was living up to the proverb which tells us to make hay while the sun shines, the railroads did their share of the work in excellent shape. Of course, there was frequently a shortage of cars during the tremendous rush to ship in the cattle during the short period of inflation, but this was scarcely to be wondered at. All the best-managed roads gave exceptional privileges to cattle trains, and frequently points were strained in their favor during the year 1882, when every man who had anything in the shape of a calf, heifer, steer or cow was tempted to convert it into money. Some men freely asserted that high prices had come to stay, and others went so far as to argue that nine cents a pound was a comparatively small figure compared with the high prices that were to be established upon a permanent basis. A good many long-headed cattlemen, however, were inclined from the first to be a little suspicious of the boom, and to foresee in the excitement which prevailed the beginning of the end, and the commencement of another cycle in the trade. These men, wise in their day and generation, realized on their investments, and allowed enthusiastic would-be buyers full leeway, though many others preferred to hold on and are still in the front rank of cattle raisers.

Mr. Wm. Kuykendall, in another of his admirable letters to the "TEXAS STOCKMAN AND FARMER," says of the period of which we have just been writing: "We find ourselves at the threshold of a new era in the cattle business, not only of Texas, but of the entire Western section of the United States as well. For the first time in the history of the industry we find the demand exceeding the supply, which, in keeping with that inexorable law of commerce, rapidly forced prices beyond normal conditions. Values of all classes of cattle were enhanced two or threefold, and grazing lands in sympathy advanced in prices proportionately. Ordinary stock cattle readily commanded from eighteen dollars to twenty dollars per head. Every female animal, whether good, bad, or indifferent, was reserved for breeding purposes. She cattle were no longer sent to the shambles, and the custom which, prior to this date, obtained among the ranchmen of slaughtering for domestic purposes nothing but choice heifer calves, was discontinued to a great extent, as it was deemed too great a violation of the law of economy. Quality, that important factor which determines the valuation of every herd, was entirely lost sight of, numbers being the great desideratum.

"To supply the demand for breeding cattle to stock new ranges, drafts were made upon the herds of Louisiana, Arkansas, and other Southern States. The Pan Handle, hitherto almost a terra incognita, and regarded as unavailable to settlement, soon became tributary to the demand for new ranges, and countless herds of longhorns were located upon these treeless plains, the erstwhile grazing grounds of the buffalo and the undisputed home of the red man. Kansas, Colorado, Wyoming and Nebraska felt the impulse, as well as Arizona and New Mexico, and in turn yielded their virgin plains to the production of cattle. Indeed, the entire grazing section of the country was brought under subjection."

While the cattle industry was emerging from darkness into light—from the depths of disaster to the heights of prosperity—great interest was manifested by foreign countries in its progress. Nearly all of the leading English papers published letters and articles from the plains and prairies, and many of the communications were full of interest, with more or less of fact. One of them we reproduce in part. It took the shape of a diary-form letter from a young Englishman, who, it is explained, "hired with a cattle king, Goodnight by name, to go to Texas to drive a herd," this engagement resulting in a partnership with a young Scotchman, and in the two young men striking out for an unoccupied ranch on a canyon on the borders of Texas. Writing on January 1, 1877, the young man said: "Goodnight left here on November 4, and by the next night we had all the things down the mountain. We were able to make a 'kinder' road for the first third and the last third of the hill, but the middle was too steep, and we had to unload the wagons and carry the things down on our backs. We then let the wagons down, hind end first, with a rope attached to the pole and turned once around a tree, and a man at each wheel. We got everything down safely and broke nothing, which was lucky. Almost the first thing done in the canyon was the slaying of two wild turkeys, which were very good eating. We drove the cattle down to where we are now, about twelve miles from where we struck the canyon.

"Everything went on much as usual—with the exception of two snow storms, one on November 13 and the other on November 22, as we had no house, and doing everything; especially getting out of bed, in a snow storm is 'bracing' to say the least of it—until December 11, when riding along down the river alone on 'Cubby,' I espied a bear. I immediately threw the persuaders into 'Cubby' and ran him up to the bear, who, of course, at the first sight of me made off as fast as possible. I kept circling round, keeping him in the open till I had killed him. I had no gun with me, only my six-shooter. I shot fourteen times before I got him to stop, but, I think, I only hit him three times. Shooting 'on the dead run' (the way they say 'at full gallop' out here) is very good fun and exciting, but with me, as yet, it is very chance work, as about all a fellow can do is to throw the pistol down toward the object and pull trigger. I have heard of good shots on horseback with a pistol, but haven't struck any yet. I skinned my bear and brought the hide into camp, when I rather surprised the 'boys,' as though we knew there were bears down here, having seen their tracks, we did not expect to see them without hunting them. Ley Dyer (one of the boys) has shot a bear since, and we have been living on him for some time. The meat is the most delicious you can imagine. I never saw any meat as fat as the bears we have killed. Their skins are so glossy, and when running they seem to tremble all over. The only kind of bear we have seen yet is the black bear. On the 5th I struck 'an outfit' hunting a cattle range. They were rather vague about where they were, and from what they told me they were thirty miles out of their reckoning, and they did not even know the name of our river, although they knew that it was somewhere in the country. The next day I struck two fellows hunting cows, or, rather, traveling over the country on the spec. of finding cattle which a large company lost on the drive from Texas to Kansas.

"The 'Texas drive' this year was about two hundred and seventy thousand head of cattle. The company they are working for lost about two thousand, and drove about seventy-five thousand. One of the fellows is a Scotchman, and reminded me very much of John ——; they are here yet, and will be, as long as they like. Anybody striking an out-of-the-way place like this stays there as long as he feels so disposed. On the 15th we finished the first room of our house, and so felt easy about future storms. On the 16th we went down the river to kill some turkeys for Christmas; about fourteen miles down a little stream we got fourteen. I killed my first (I have just come out of doors from helping to 'get away' with the last of them). The reason I have been seeing everybody is that I am the only one riding every day, as the cattle are very little trouble now, and seem contented (I don't know if it is because they can hardly get out), and the rest of the boys have been working on the house and corrals.

"On the 22d I washed all my clothes, a very great undertaking, as I had a large collection—in fact, every stitch I possessed—not having washed my clothes since we left the Canadian. On the 23d and 24th it snowed. We all shaved and 'greased up' with bear oil for Christmas—the only thing we could think of doing, as we had run out of all grub except flour; but then flour, bear, buffalo and turkey is pretty good living. On the 25th, Christmas Day, Ley started up-country to find what had become of our provisions, and corn for the horses, as they were overdue nearly a month. It snowed

again on the 28th, and the snow is on the ground yet. We all think it must have been a pretty severe storm in the outer world (i. e., out of the Palo Duro Canyon), as we are pretty far south. Yesterday we repeated the shaving and greasing-up for the new year. It is very curious how it changes fellows shaving off their beards. Ley Dyer has a very slight growth on the upper lip, and shaving it off made him look very long-faced and large-toothed. Dane (another boy) is also ambitious as to his upper lip, and so shaved it and his side-whiskers, and underneath his chin, till he looks rather like a navvy, and a pugilistic one 'at that.' They say that Johnson and I look like 'winged outfits' about the head, as nobody wears side-whiskers out West.

"All these items I gather from my almanac, which I have kept ever since I struck the United States, and am sorry the new one has not come in to begin on at once. I now, having got rid, as it were, of the old year, will wish you all, or rather will hope you have had, a merry Christmas and a happy New Year. I did hope to get off a letter in time for Christmas. These fellows, the lost cattle hunters, who in their travels of six weeks struck Fort Elliot, with the exception of which they never saw a white man till they came here, say it is one hundred miles any way you make it. You may think it strange that we do not start out and go there, but any journey down here means two fellows away for an indefinite time, and our horses are too poor (through delay of corn) for us to hunt anything but cattle, although, of course, we would like to go to the fort for letters. They have a weekly mail there which comes from Fort Dodge on the railway. They call it two hundred miles from Elliot to Dodge.

"I do really hope you are beginning to understand the amount of uninhabited country in these parts—it has become a pet hobby of mine thinking about it. The buffalo are pretty thick here. The main herd is about one hundred and fifty miles southeast of us. The Scotchman saw it two years ago, and says it was about one hundred miles long and fifty broad, and I have always heard they are pretty close packed in the main herd. I don't think I told you about the first buffalo I killed. I was, luckily, on 'Cubby,' who, as you know, is my favorite, and exclusively my own horse ('doesn't belong to the concern,' as Goodnight would say). I ran 'Cubby' right up alongside the buffalo, within about ten feet, and commenced firing with my six-shooter. I brought him down at the sixteenth shot, having, of course, to load and throw out the shells 'on the dead run'; very exciting and jolly, and not at all dangerous, as long as you don't tumble off your horse at any sharp turn after the buffalo is wounded."

Writing a week later, the same correspondent said: "On the morning after I had written the above, Walter got into camp with letters and tobacco, so you can fancy what a jolly evening we had. You should have seen the boys going for the baccy—they got it off his saddle before he had time to get down. I got your letters from Offley, also C.'s, L.'s, and P.'s. Please thank them all. I can so easily imagine you all at Offley, and everything going on 'as per usual.' Thinking of how people at home, especially in country places, seem to have certain things to talk about and do at certain times, is a great source of amusement to me. I was very much struck with it on my run home last year, especially Mr. Davies's church, where the fellows seemed to all have on the same coats, etc. Four days ago Ley and I started down the river on an exploring expedition, and he took it into his head to rope ('lasso,' as the yellow-backs have it) a buffalo. He threw his rope onto a buffalo cow, and shot her twice. The cow then commenced 'coming for' him, and his horse getting scared, 'let into bucking,' and spilt Ley on a stump. He got very badly shaken, and can do nothing yet, but I hope there is nothing else wrong. For two or three hours he lay and could not move at all, and I had to move him when he had to change positions. The first thing he said was, and is, I believe, what everybody has in their minds when badly hurt, 'I tell you, Hugh' (my name in this latitude), 'this thing of life is a mighty uncertain kinder business.'

"Things have never looked so well for us before, as now we have got the cattle into a place where they can hardly get out, and the only thing we have to fear are horse and cattle thieves. Our expenses are comparatively over. Of course, we have been under very heavy expenses till now, as it takes so many men to move cattle about the country, and you are more liable to lose them; and they never do as well and 'breed up' till they are settled and, as it were, at home. I shall not enter on this any more till next fall, when we shall sell our beef, and I hope to send you a very favorable report in figures. In this life there is a very happy combination of business and pleasure, as a fellow is always running across game which other men have to hunt, and then very often don't get."

In view of the many conflicting statements as to the business in 1883, we have prepared the following table from returns furnished by the different railroads. The figures show the number of cattle received at Chicago, St. Louis and Kansas City during the year, and have never before been published in this form.

CATTLE DELIVERED BY	CHICAGO.	ST. LOUIS.	KANSAS CITY.
Chicago & Alton	214,769	20,629	6,177
Baltimore & Ohio	1,732	....	....

Driven in	5,183	6,689	18,757
Total	1,909,167	410,008	460,780

This return shows that the receipts of cattle at the three largest markets, during a year which has frequently been spoken of as one of phenomenal, and indeed wonderful prosperity, of something less than three millions. Various estimates received orally from men engaged in the trade have placed the total for the year as high as five and even seven millions, showing how dangerous it is to base calculations upon problematical and mental arithmetic calculations. Chicago continued after this point to gain rapidly on its rivals, and during the first six months of 1885 it received 886,619 head of cattle, as against 812,593 during the corresponding period of the preceding year. Kansas City about held its own with a total for the six months of two hundred thousand, while St. Louis fell off considerably, its total for the first six months of 1885 being one hundred and eighty-six thousand, as against two hundred and forty-three thousand in the corresponding period of 1884.

The figures are given at this stage because the period covered was very largely pivotal in character, including as it did the last of the boom years and the opening period of the very disastrous reaction which almost of necessity set in.

CHAPTER VII.

Cattlemen in Convention Eleven Years Ago.

THE history of conventions contains the record of no grander gathering of delegates than that at the first National Convention of Cattlemen held in St. Louis during the third week of November, 1884. It is generally stated that this was the largest Convention ever held in point of numbers, excluding only the great nominating conventions held every four years. Every newspaper man will bear out the statement that the difference between the anticipated and the actual attendance at commercial or industrial conventions is almost always extraordinary. The writer while connected with the daily press reported several hundred gatherings of this character, and was often called upon to disprove, by actual facts and registrations, the optimistic figures given out by the heralders of the conventions. Frequently, when it was announced that seven or eight hundred delegates would attend, a couple of hundred was all that put in appearance, and it was quite usual to allow the public to encroach considerably on the space allotted to delegates, in order to cover up the nakedness of the affair somewhat.

But the Convention in November, 1884, was an exception to this rule. We are not aware exactly how many delegates were announced in advance, but the names are recorded of thirteen hundred and sixty-five men who were admitted to the floor as accredited representatives of cattle States or cattle associations. In addition to this there were at least a thousand others in attendance, who were deeply interested in the result, and who formed a lobby of an intelligent and influential character. St. Louis has been called the City of Conventions on account of the immense number of representative gatherings, political, social and commercial, which have been held within its hospitable gates. Never, however, has it been called upon to welcome a convention of more colossal proportions than the one to which we are now referring, and which marks so great an epoch in the history of the cattle industry of Texas and the Southwest, that we are compelled to deal with it at considerable length. There had been money in cattle raising for some years, and prices had touched such high points that many of the men who answered to the roll-call on the occasion named had merged from practical insolvency after the panic of 1873 to wealth and opulence after the boom which culminated nine or ten years later.

The cattleman, as all the world knows, is generous to a fault, and the way money was spent in St. Louis during the week of the Convention made glad the hearts of her trading citizens. Many exaggerated stories have been told concerning the feasts and fetes of the week; but, setting these aside, it is a fa[illegible] that presents, souvenirs and keepsakes were bought in every direction, and thousands of dollars were certainly expended in this way. Pride, we are told, goeth before a fall, and one of the most reliable and conservative cattlemen in the country merely voiced the sentiment of several of his colleagues when he told the writer, last fall, that he believed the tremendous show of wealth and success of the great Cattle Convention of 1884 sounded the death-knell of the industry, and hastened, if it did not cause, the heart-breaking reaction which followed.

This opinion is merely reported and not endorsed. The ancient Romans had a proverb which, being translated, reads "Great is the truth and it must prevail." Argued from this standpoint, the obvious genuineness of the first National Cattlemen's Convention and the immense fund of information which it laid before the trade, and incidentally the public, ought not to have had any such effect as that suggested. In a subsequent chapter, while tracing the causes of what may be described as the fall from grace of cattle raising as a money-making or money-coining industry, it will be necessary to revert to this subject and to this opinion, which is merely quoted here as an evidence of the magnitude of the Convention in the eyes of those best able to form an estimate and base an opinion.

Certain it is that there was very little modesty or bashfulness about the Convention or those who attended it. The Cowboy Band, of Dodge City and Parsons, Kan., was something unique in the

extreme, and every one in St. Louis gazed with mingled awe and astonishment on this aggregation of musical wealth, or wealthy music, whichever may be the correct expression. This band has been correctly described as the most unique feature of this very unique Convention. It did excellent service as an escort to the various delegations which marched to the Exposition Hall, making several trips back and forth and leading the procession which escorted the Governor to the hall. It was composed of nineteen performers, all of them cowboys selected from the various cattle companies in Kansas. The leader was J. W. Eastman, and it was made up of the following members: D. Mathies, James Smith, Roy Drake, W. K. Robertson, W. S. Reamer, George Horder, H. G. Willis, Harry Adams, Frank Cummins, L. A. Louher, Frank Warren, George Meserale, C. M. Beesen, George Ragland, Charles Ottero, C. A. Miller and W. M. Visquesney.

The band uniform was a very appropriate one, consisting of a white felt hat, with a band, having the name of the musical aggregation inscribed on the side, and with the figure of a steer and the brand of the company to which the performer belonged in front; blue shirt, leather leggings, boots and spurs, and belts with ivory-handled pistols in them, completed the outfit. Capt. J. S. Welch was the drum major, and, instead of the usual staff, he carried a magnificent pair of horns, with a banner suspended from it inscribed with the legend: "Cowboy Band, Dodge City, Kansas, $20,000,000." The figures indicated the amount of hard cash represented in the band. The horns were among the finest ever seen. They measured five feet from tip to tip, and were highly polished and richly mounted. The band was offered one hundred dollars for them by a commission merchant. It took part in all of the public demonstrations. The members were all skilled musicians, but had only been practicing together for a week.

The large hall in the Exposition Building was decorated with a profusion seldom seen since. The popularity of the cowboy among members of the fair sex was evidenced by the presence of a large number of the fairest daughters of St. Louis and vicinity, and all around there were flowers and plants. Two handsome horn vases filled with flowers stood upon the Chairman's table, and elegant banners bearing the names of the different States and Territories were scattered throughout the hall. Every one in the city realized that something exceptional was taking place, and as a very excellent report of the Convention published at that time says, "the great broad-shouldered, brawny, bearded men, although they looked not quite at home, showed a proud consciousness of being welcome. These were the cattlemen of the West, coming together in St. Louis to their first annual Convention. There was an unmistakable class look about them—a class look, too, of which every man in the class may be proud. There was the unfettered carriage of men whose lives had been lived on the great plains, who were accustomed to wide horizons, who were used to the open, wholesome air, to much horseback riding, to much camping out. Even in matters of dress and bearing, the cattlemen are peculiar; they wear wide white hats, long black coats, and, as a rule, long silky beards. The toilet sets off the form well, and no man could help being impressed with it."

"The men," the report referred to went on to record, "represent many millions of capital, and the most tremendous new industry of America. They are the men who have put a new value upon the waste lands of the boundless West. Their herds, recalling the pastoral days of the world's history, fatten upon a thousand hills, from the farthest reaches of the Republic in the North to the Rio Grande. They are the latter-day representatives of the patriarchs, and they have some of the patriarchial in their bearing and manner. The business which has brought them together has been so thoroughly well advertised that there remains but little to be said about it. They come together to consult on the national needs of an industry that represents more capital than would be required to pay off the national debt. There is legislation needed by Congress and by separate States, which the Convention requested. There were trade matters of national importance which the Convention discussed. There were a hundred things done vital to the cattle trade, and through the latter trade to the Western country, which gave the Convention a paramount importance.

"The Texas men concluded that there was only one matter that they would press upon the Convention, and that was the National Trail. The matter was debated over and over again, and it was decided that that issue alone should be pressed, and that Texas would ask nothing else. At the same time, Texas did not believe that there was ground for being over-confident of the ultimate establishment

BUFFALO AND ELK ON CHARLES GOODNIGHT'S RANCH.

THE
JOHN CRERAR
LIBRARY

of the trail. The opposition of Kansas was counted upon as sure, and it was admitted that it will take one million dollars to buy the right of way over the settled part of the proposed route. The Texas delegates had been told that while the delegates from the North would not oppose the trail scheme, they would not work for it, and they would sooner see it fail than succeed. If the North was not sure that Kansas alone would itself fight the trail, its delegation would be actively hostile instead of passively and inertly careless.

"The Wyoming delegation, at its caucus, concluded to present a resolution, which it asked to have included in the memorial, asking for legislation which will permit the leasing of the public domain to the stockmen. Mr. Nagel, the Chairman of the Wyoming delegation, explained the desire of himself and his friends thus: 'These lands are entirely unfit for cultivation; they are only good for grazing. Now, we want Congress to pass such a law as will permit the leasing of the public lands. We hope to have the matter so arranged that the Government will lease large blocks of land by district to associations of cattlemen, who will divide it out among themselves, thus preventing any man from fencing off the water. You see, they are not doing anything which would be opposed to the rights of other cattle owners. Of course, all these matters of detail are very simple, and are to be considered afterward. The main point is the leasing of the land for the longest term possible. That we will press upon the Convention as strongly as we can. It is very easy to arrange and protect the rights of all under the law.'

"In all the delegations the questions of quarantine were discussed, and part of the memorial will be devoted to this subject. The Convention asked Congress to pass rigid quarantine laws, which will effectually protect the cattle industry of the whole country. The chief danger feared by all is the pleuro-pneumonia from the East. It was conceded by all, North and South, that cattle can not carry Texas fever. When driven any distance North the disease of itself disappears. But the pleuro-pneumonia is the danger about which the cattlemen are really nervous. In the event that Congress does not pass the required law, it is probable that the delegations will agree upon a series of uniform quarantine laws which they will ask their own respective States to pass."

The Governor of Missouri and the Mayor of St. Louis welcomed the Convention, and such distinguished men as General Sherman, General Curtis, Ex-Governor Fletcher and John Hogan were on the stage with these gentlemen. Major C. C. Rainwater, of St. Louis, was temporary Chairman, and he introduced the Mayor of St. Louis (Mr. William L. Ewing) to the audience. In a few well-chosen sentences that gentleman pointed out that no inferior figures could be used in numbering the products of the cattle industry. "They are told," he said, "by the million, and by the introduction of superior blood the character of the herds has been so improved that they bid fair to equal, in the near future, the ordinary farm-raised stock." Governor Crittenden followed in the same strain, giving special attention to the shorthorn and to the statistics of cattle raising in Missouri. General Sherman was called upon for a speech, and amidst a tumult of enthusiasm shook hands, figuratively speaking, with the cowboys, and wished all the health, luck and prosperity which the wild, natural and brave men deserved. Among the other distinguished visitors to the Convention was Captain Bedford Pim, of the British Royal Navy, who was present with Messrs. Bostwick, Hibbard and Bancroft, of the New York and Boston Cattle Co. Taking advantage of his presence in America on other business, he attended the Convention in order to gather all the information possible relative to the securing of cheap and good beef for the English people. "The great question in England," he said, "is the food question. To talk of attacking England by invading her shores is foolish. The best way to attack England to advantage is to send out a gunboat and intercept the ship bearing food to England, and the nation is conquered at once. With England and America united we can knock out the world. We will not have to knock them out, because we could starve them out without a blow. England has a limited area which cannot be increased one inch, and a constantly increasing population, and the problem of obtaining without interruption a constant supply of beef and breadstuffs is a great one. Here you have a great stock-raising and growing country, sufficient to almost supply the world, and the question is how best to bring the supply and demand into communication.

"As to shipping cattle to England to be matured there, I do not think well of it, for the reason that we have not the grazing land to fatten them on. What could England do with one million cattle

sent over to be fattened, and with thousands of additions coming on the heels of these? It cannot be done. The cattle must be fattened here and shipped alive as rapidly as possible, or shipped dressed and frozen. There was, at one time, prejudice existing in England against American beef, but there is none now to speak of, especially against cattle. Now, my plan is simply this: To ship or drive the cattle from Colorado and the lower ranges, or from Montana and other Northern ranges, to the most convenient port accessible to Hudson Bay. I think that ships for the purpose should be constructed; not immense, so that crushing by the ice would result in the destruction of large cargoes, but light, small ships, sailing vessels with only small screws and power enough to drive them through the ice when necessary. Little tugs, taken aboard and lowered when needed, would, I think, be amply sufficient for the purpose. The route through the East at present is too expensive a one, and, I may safely say, a week would be saved at least. The western winds would drive the ship directly to the English shores. Arrangements could be made at all of the English ports for feeding and caring of the animals before their distribution to English markets. I know all about the route, because I have been over it, and six years' experience in the ice made me entirely familiar with the difficulties to be overcome. There are no insurmountable obstructions in the way of the plan. However, I do not come here as an expert, but as a learner, and I shall look into the cattle question so as to be able to tell my people what can be done in this way. There is no English company ready to take hold of it as yet, but there need be no fear of lack of capital. The English people are careful, but they place great weight on the opinion of a man who has investigated and has seen for himself. There is abundance of capital ready to be placed in any sound, sensible and reasonable project."

Probably the most extraordinary feature of the Convention, which was permanently organized shortly after these speeches, was the extent of its representation. Connecticut, Maine, Kentucky, Arkansas, Rhode Island, Tennessee, Minnesota, Utah, New Hampshire, Oregon, Ohio, New York, Maryland, Pennsylvania, Missouri, New Mexico, Wisconsin, Wyoming, Colorado, Idaho, California, Illinois, Iowa, the Indian Territory, Kansas, Texas and Massachusetts were all represented by delegates at large, in addition to which there were special delegates representing almost countless cattle associations throughout the West, Southwest and South. We give a list of each stock-growers' or cattle association which was represented at the Convention, because of the significance of the list and of its importance as a matter of history. Many of the associations were short-lived. Several of them have long since gone to that bourn whence no traveler returneth, and a great many others have very wisely consolidated with larger organizations in their own States or Territories. But the list of associations as given below tells a story which can not be left untold in a history of the cattle industry, and hence we give it in full, extracting the names from the official proceedings, and more especially from the report of the Committee on Credentials. A perusal of it is recommended even to the man who always skips tables and statistics, because, read between the lines, it points a most important moral and adorns a most instructive tale.

WYOMING.

WYOMING STOCK GROWERS' ASSOCIATION.

Mr. John L. Routt, of Colorado, was made permanent President; Mr. M. N. Curtis, of New York, First Vice-President, and Mr. A. T. Atwater, of St. Louis, Secretary. An ivory gavel, the gift of the "NORTHWESTERN LIVE STOCK JOURNAL," of Cheyenne, was handed to the President, with which he rapped for order. The first business done at the Convention was the appointment of a permanent committee to draft a constitution for a National Cattlemen's Association, and Judge Carroll, of Texas, then moved that the Convention memorialize Congress for legislation for the establishment of a national stock trail, beginning at some point on the Red River and extending thence in a north or northwestern direction to the northern line of the United States. This question appeared to be, in the opinion of the delegates from Texas and the Southwest, the burning issue of the day, and a debate of the utmost importance followed. Mr. Carroll went so far as to say, more ingenuously, perhaps, than was quite politic, that it was *the* question which had brought the Texas delegates to St. Louis, and that it was the one question to which they would ask all cattlemen and those interested in the trade to give their direct attention. He argued that it was to the vital interest of Texas, and also the Northwest, to have this national trail established.

Gov. Stone, of Colorado, was equally strong in his support of the proposition, and Mr. Dorsey, of New Mexico, was another enthusiastic speaker on the same subject. Mr. Russell, of Kansas, voiced

another side of the same question when he said that several from his State had been burned already a good deal by the cattle trail from Texas, and did not want any more of it. Some of his friends from Texas went so far as to say that there was no such thing as Texas fever, but he knew to his sorrow that there was. If the trail was not proposed to go through Kansas he was not opposing it. The profit on cattle feeding had filled up Southwest Kansas with improved and improving herds, and he wanted them protected. Mr. Norman J. Colman, of Missouri, followed with a more temperate address, stating that if a trail was required it ought to be provided, and that Congress could attach such restrictions and precautions as would obviate danger of the character anticipated. The consumers of the North were just as much interested in the matter as the producers of the South. The former wanted cheap and good meat all the year round, and objected to being starved in summer and surfeited in winter.

Col. Stewart, of Montana, let some light into the cattle situation of the day by protesting against the expression in the resolution, "the breeding grounds of Texas to the maturing grounds of the North." The strip of ground, he argued, on both sides of the Rocky Mountains, from Texas to the British possessions, was a breeding ground for cattle, and he failed to see why Government aid should be asked for a trail to enable the Texas breeders to get their surplus stock through into the British possessions. Thousands of cattle had been shipped to market from Montana that year because the ranches were overstocked. He was perfectly willing that people should bring their cattle to Montana in the good, old-fashioned way, as he and his associates did. But he protested against Government aid being provided to overwhelm Montana with cattle.

Mr. Culver, of Kansas, speaking of the danger, actual and alleged, of Texas fever, said that while Health Officer of Dodge City he inspected four thousand six hundred and fifty head of cattle, all of which were healthy. Some of them on reaching Eastern markets turned out to be diseased. They did not get this on the cattle trail, but by being grazed upon territory upon which scattered and promiscuous herds had been grazed. He claimed that Texas cattle must have the right to go through the country, and that, in justice alike to the Texas cattlemen and those of more Northern States, a trail ought to be opened and fenced. Its exact location would then be known to all, and the danger of infection would be minimized. At a subsequent stage of the proceedings, three or four days later, a vote was taken, and the following memorial in favor of the opening of a trail as suggested adopted.

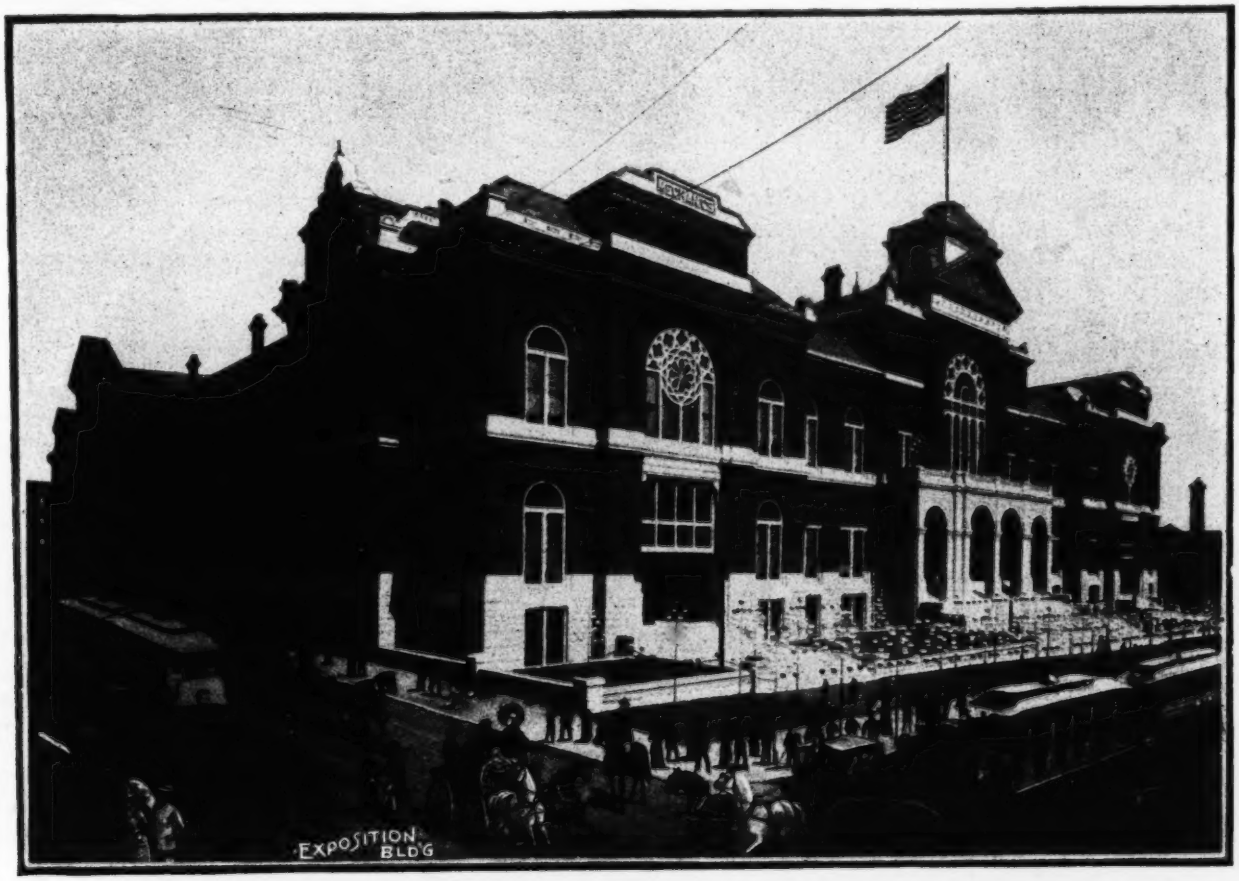
"To the Governors and Legislators of the States of Colorado, Kansas and Nebraska:

"We, the Executive Committee of the National Cattle and Horse Growers' Association, emanating from the first National Convention of Cattlemen of the United States, consisting of one thousand three hundred delegates, representing almost every section of the Union, which assembled in Convention, November 17th to 22nd, 1884, in St. Louis, Mo., do hereby present the following memorial and facts, to wit: The first National Convention of Cattlemen did memorialize the Congress of the United States, praying for the establishment of a natural highway, or cattle trail, from the Red River of the South to the British line on the North. Now, therefore, realizing that such proposed national cattle trail, or highway, must of necessity traverse the territory embraced within the boundaries of one or more of the States named herein, we do most respectfully ask your honorable bodies, at the earliest practical date, to declare and grant your consent to the establishment by the General Government of said national highway, or cattle trail, within and across the territory embraced within the boundaries of your respective States, it being understood and intended that said highway and cattle trail will be located upon unsettled domain, so far as may be practicable, so as not to in any manner interfere with any habitation or material interest, without first compensating such person or interest within the limits of your respective States."

Unfortunately, the trail referred to, carefully fenced in and so defined that no danger could possibly result from it, has not yet materialized, and it is more than doubtful whether it ever will. The minds of a great many of the delegates seemed to be vastly relieved, however, by the expression of their opinions and by the adoption of a memorial, and the Convention turned its attention to less controversial subjects.

The Committee on Resolutions handed in a report calling attention to the fact that large tracts of the public domain having been reserved for the exclusive use of Indians, permits were granted every year to large numbers to leave their reservations and hunt over ranges stocked with cattle.

This practice, it was pointed out, had a tendency to exasperate the rangemen and to provoke hostile collisions, and it was hence resolved that the Secretary of the Interior be urged to restrict all Indians, except those in the Indian Territory, to the limits of their respective reservations. General P. Porter, of the Muskogee and Seminole Live Stock Association, spoke at length on this resolution. Taking the Indian side of the everlasting controversy as to the policy to be adopted toward the red man, he spoke in a most feeling manner of the rights of the Indians. In the Indian Territory, in which a great number of those present owned cattle, herds were grazed upon Indian lands by mutual consent. Out of this agreement the cattlemen derived a large income, and the Indians also were learning to own cattle and make money for themselves. The resolution might be very applicable to other States and Territories, but he did not think it was applicable to his district. He thought that the depredations of



WHERE THE GREAT CONVENTION WAS HELD.

the Indians, as well as the encroachments of the cattlemen, were greatly exaggerated, and he was afraid that the preamble, as worded, was calculated to increase the differences between the two classes.

Dr. Moore, in the course of a warm speech, said that the resolutions had reference only to the Indians of New Mexico, Southern Colorado, Arizona, Montana and Wyoming. "In these sections," he said, "every year we are depredated upon by these bands of roaming Indians just in the manner recited in this preamble. I have no objection whatever to striking out the preamble, except that the preamble contains the reasons of the resolution. I submit to the candid consideration of the Convention that those reasons are no more in the interest of the cowboy than they are of the Indian; that they are in the interest of peace and equity, and in the interest of the General Government, and that the preamble carries along with it the very reason why that resolution ought to be unanimously adopted by

this Convention, and the last man upon the floor of this Convention to object to resolutions like that, which pays him and his associates of the Indian Territory the high honor of excepting them from all the other Indians of America, the very last man is he who ought to object to the passage of the resolution and the preamble which explains it.

"I have had my range burned over; I have during the past year ridden for three days through fire still burning, which the concurrent testimony of every cowman in my region asserted was the result either of carelessness or the criminal intent of roaming bands of Indians, who were depredating upon those ranges stocked with our cattle. I, therefore, in the interest of the Indians on the one hand, and in the interest of civilization on the other, for I will not do my brother the disservice of saying that as the carboniferous ages preceded the ages of animal life, and I will not make the application only to say that wherever in the great march of civilization there is standing in the way any obstruction, whether it be in institutions social, or in institutions of race, those obstacles must be lifted out of the way; civilization has the right of way to the centuries that are to come. I appeal to you, I again say, in the interests of the Indians on the one hand, and of the National Government on the other hand, and of peace everywhere, that these resolutions and the explanatory preamble ought to be adopted."

Gen. Brisbin and Mr. Pollack, of the Indian Territory, spoke in opposition to the preamble, and expressed an opinion that it was unnecessary, as the Indians and the cattlemen were getting along well together. This brought to his feet Mr. Stuart, of Montana, who spoke in a very different vein, and pointed out that, however matters might be in the Indian Territory, the Indians and the Government, between, them did a great deal of injury to the stock interests of his section of the country." We only ask," said he, "that the Indian be kept on his reservation. We pay taxes to feed and clothe him. In Montana there is that state of affairs. The Indian is not to blame. I sympathize with him, and have always done so, and my life shows it. It is the atrocious policy of the United States that is to blame, and not the Indians. They put them on reservations and pretend to feed and clothe them, but they don't half do it. Then they give them permission to leave their reservation and go and prey upon one another; to murder, and steal horses from one another. That is what the United States permits the Indian to do to-day in Montana; it is done daily and hourly. The Indian is not to blame and never was. He is a much-abused individual, and I will stand up for him, even if he does steal my horses once in a while. It has occurred in the history of Montana, not long ago, that an Indian agent, in charge of a powerful nation, paid them five dollars a head for every stolen horse they would bring in, and he taxed the owner twenty-five dollars for them. We want the Indian to have his rights; we don't want him to be robbed; we want him protected; I want him to be as much a citizen of the United States as I am. But we do detest and abhor that policy which says, 'Go and steal from your neighbor Indian; kill him, if necessary, and we will wink at it.' The Government never has prosecuted one of them yet for doing that, and never will prosecute one in the Northwest."

Mr. Gosper, of Arizona, was equally eloquent as to the difficulties the Indians interposed. "I have lived in Arizona eight long years myself," he said. "I have looked the Indians in the face, and I know, as it is well known to all you men who have read the dispatches relating to Indian depredations in our Territory, that hundreds of thousands of dollars have been destroyed by those Apache Indians, in the shape of freight, teams, cattle and horses, in their having left the Indian reservation—the San Carlos Reservation—not under the consent or guiding hand of the Secretary of the Interior, but against his orders. I say to you it will be an imperishable insult to the frontiersmen, those who have dared to take their lives in their hands and face these murderous Indians, if you shall oppose, or rather rescind, the preamble to this resolution and destroy the resolution itself. That preamble simply recites the facts, which are these: That the Indians do leave their reservations; that the Indians do steal and destroy our property. It does not say they destroy our lives. It might be well added in the preamble that they destroy our lives as well as our property. I say to you it will be an insult to American civilization, to American enterprise, to the fitness of things in this nineteenth century, if you rescind that preamble. I hope that the good sense, the good character and the wisdom of the men that are here to-day, who vote upon this proposition, will not let them stultify themselves and the knowledge of the facts that they know, or ought to know in their positions, and vote down the preamble and resolution that does not cover one-half the facts that are true out in our mountain region. Over in your section, Mr.

Stuart, it may be altogether different. We hope it is. God be blessed if your lives are safe and your property is safe! But, in the name of justice—in the name of righteousness—don't oppose a measure that can do you no harm if passed. We have been fighting, in this Western country these many years, this ignorant sentiment that the Indian is a better man than the white man. That is not the case. You talk about the Indian starving and never offering to go off his reservation to get something to sustain life with. I have been upon the San Carlos Reservation. I have seen the Indians come up to the Quartermaster's Department and take their grub—as we cattlemen call it—in large quantities. I have seen the beeves slaughtered, and have seen them carrying it off on their shoulders. They are better fed to-day, in my Arizona country, than the poor men who are riding the bronchos over the plains, and hunting the mineral hidden away in the mountains."

The debate acquired exceptional interest from the fact that it was construed, in some quarters, as an attempt to secure Government sanction to acts of aggression on the part of cattle feeders, who were accused of anxiety to secure control of Indian lands without legal process. Nothing that was said seemed to justify this contention, although it was made with considerable vigor and even bitterness. Finally, the resolutions were referred back to the committee, by whom they were amended so as to strike out the more objectionable features. The compromise read as follows:

"Whereas, The Indians in various sections have been virtually forced, by the inadequacy of their supplies, to forage outside of their reservation; and whereas, in New Mexico, Arizona, Colorado, Wyoming, Nevada, Montana, Eastern Oregon and Dakota, permits are given each year to bands of Indians to roam at will over the lands beyond the limits of their reservation, whereby great damage by fire and depredation is entailed upon the live stock industry, and hostile collisions with rangemen made imminent. Now, therefore,

"Be it resolved, That it is the sense of this Convention that all the covenants of the Government with the Indian should be most scrupulously and honestly carried out, and that the Indians named in the preamble, having been granted the exclusive use of vast areas of public domain, should be rigidly restricted to the limits of such reservations."

These resolutions met with general approval, and were adopted without further debate. The attitude taken by the cattlemen in regard to them is of especial interest at this time, in view of the repeated allegations made against the rangemen, at frequent intervals, of oppression toward the Indians. As a matter of fact, no body of white men have got along more comfortably with the Indians than those engaged in the breeding and feeding of cattle. Where the Indians have displayed any desire at all to fall in with the existing conditions, and to engage in agricultural or similar pursuits, the cattlemen have treated them as neighbors, and have been their best friends. It is only when theft and criminal carelessness have been characteristic of the much-pampered and much-abused redman, that the pleasant relations have been suspended. In the Indian Territory, particularly, the cattlemen have taken the part of the Indians against the Government in countless cases of attempted oppression. It would, indeed, have been a good deal better for the Indians, both financially and socially, had the Government interfered less to hamper the stockmen, and to encourage promiscuous settlement by so-called "boomers."

Copies of these resolutions were forwarded to the Secretary of the Interior and to the Commissioner of Indian Affairs, and, to some extent, the result was satisfactory.

The next question which occupied the attention of the delegates had reference to location. Mr. Dwyer, of New Mexico, argued that experience had demonstrated that beef cattle could be more economically raised in the arid and elevated portions of the country than elsewhere, and that the vast plateau lying between the ninety-eighth meridian and the Sierra Nevada Mountains was better adapted for this purpose than any other part of the United States. Under the existing laws, he pointed out, the occupants of this region were unable to acquire title to land in such quantity as to guarantee permanency and security in their business, and to justify such improvements and expenditures as had been made in other States. These lands could be leased for a term of years with profit to the Government without, in any manner, conflicting with existing homestead and pre-emption laws. More than three hundred million dollars had already been invested in live stock within the limit specified, although the owners of these herds had been unable to lease or purchase the lands, holding them only by

possession and sufferance, and their property was in constant peril from conflicting claims. He argued that the beef raised on these plains had become an important factor in foreign trade, increasing in greater ratio than any other product, and would, if properly protected, become at an early date the most important article of food supply sent from America. Under these circumstances, he believed it to be the duty of the Government to aid the industry in every way consistent with the general welfare. With these ends in view, he asked the Convention to memorialize Congress in favor of leasing the lands referred to for a term of years, reserving all the rights to actual settlers under the homestead and pre-emption laws, and excluding California, Nevada, Oregon, Utah and Idaho from the operation of the proposed change.

The matter was sent to the Committee on Resolutions and acted upon favorably.

Our old friend, Mr. McCoy, whom we have quoted so frequently in this work and whose impetuosity was one of the few almost amusing features of the great Convention, brought up the trail question again. He was anxious that the proposed trail should be not more than six miles in width, and that it should be contracted to a width not exceeding a hundred feet at convenient points, in order that by bridges, arches or other devices herds of cattle might be safely crossed over any national highways or live stock trails.

The last business on the fourth day of the Convention was a resolution to form a National Live Stock Association, and to commence active work therewith immediately after the close of the Convention. The fifth day was occupied very largely with a very vigorous discussion upon the proposed constitution, which was printed in the morning papers before being brought in detail before the Convention at all. As the constitution was commendably brief, and as a great many points of importance were involved in it, we reproduce it in full, as it was finally adopted:

1. The name of this association shall be "The National Cattle and Horse Growers' Association of the United States."

2. The object of this association shall be to promote, in every legitimate way, the cattle and horse industry of the United States.

3. Any person directly connected with the cattle or horse growing industries of the United States may become a member of this association by paying to the treasurer thereof an admission fee of five ($5.00) dollars; and any association of cattle or horsemen may become a member of this association by paying an admission fee of fifteen ($15.00) dollars.

4. The annual dues of each member and association shall be fixed by the Executive Committee, and shall not exceed two dollars and fifty cents ($2.50) for each member, and seven dollars and fifty cents ($7.50) for each association; provided, no member shall be required to pay annual dues until he has been one year a member of the association.

5. The officers of this association shall be a President, a First Vice-President, and one Vice-President for each State and Territory represented in this association; a Secretary and Treasurer, each of whom shall hold his office for one year, and until his successor shall be duly elected and qualified.

6. There shall be an Executive Committee, consisting of fifteen (15) members, to be elected at each annual meeting of this association, and eight (8) of whom shall constitute a quorum for the transaction of business; the President of the association shall be ex-Officio Chairman of the Executive Committee.

7. The business of the association shall be managed by its Executive Committee, which shall be empowered at all times to do, and to procure to be done, such things and expend such moneys as in its judgment will promote the best interests of the association. It shall have control of the investment and expenditure of the funds of the association, and make frequent examination of the books of the Secretary and Treasurer. It shall, at its first meeting, adopt a code of by-laws for the government of the association, which may be altered or amended by the Executive Committee or the association at any annual meeting.

8. The chief office of this association shall be in St. Louis until otherwise ordered by the Executive Committee.

9. No officer, except the Secretary, shall receive any salary.

10. An annual meeting of the association shall be held on the fourth Monday of November of each year at such place as the Executive Committee may determine; and each member of the association shall be entitled to cast one vote at such meeting. Local associations belonging to this association shall be entitled to three votes. Each State and Territory shall be entitled to one delegate at large, duly accredited by the Governor thereof.

11. Nothing in this constitution shall be so construed as to prevent any cattle or horse grower from the Republic of Mexico or the Dominion of Canada, who is a member of some regularly organized cattle or horse growers association, from becoming a member of the National Cattle and Horse Growers' Association of the United States, by the consent of this association.

12. This constitution may be altered or amended at any annual meeting of the association, by a vote of not less than two-thirds of the delegates present.

It was generally believed that the association which was to be governed by this constitution would promptly assume proportions of great magnitude, and that its influence over and upon the cattle trade of the country would be prodigious. Under these circumstances it can be easily understood how eagerly the details were discussed, and how exciting were the debates which followed their perusal. Mr. McCaskill, of Colorado, complained strongly of the basis of representation at first proposed. He pointed out that for the first time in the history of the cattle trade there had been a grand gathering of cattlemen from all parts of the country. Many of them had become acquainted for the first time, and the industry being in its infancy, it was most important that these relations should be maintained. He was afraid that as originally drafted this constitution would take the control of the association out of the hands of the cowboy and place it in the hands of the professional politician.

Governor Stone, of Colorado, argued in favor of State and Territorial representation, even when there were no associations in such States. As a Democrat in spirit and principle he wanted to have full representation, and did not think the constitution as arranged would meet the case.

Mr. Wood, of Missouri, Chairman of the Constitution Committee, defended the original draft of the constitution, which, it may be explained, differed in some respects from the articles as finally agreed upon. In regard to the question of representation by associations, there were two sides to it. He represented an association whose invested capital in the cattle industry did not exceed a quarter of a million dollars and whose membership was about twenty. There was represented in the Convention an association from Wyoming representing millions upon millions of dollars invested in the cattle industry, and representing hundreds of men who ought to have more representation than a solitary twenty. In Texas again there were twenty associations, and in Montana one, and he failed to see how they could adjust the difficulty except in the way suggested.

Judge Thornton, of New Mexico, in a speech full of feeling, said that the association was designed for men who had left their homes in the older States and gone into the broad deserts, where they had turned the home of the buffalo into the meat-producing country that was feeding the nation. These men wanted not a live stock association, but a cattle growers' association. It was not desired that raisers of all kinds of live stock should be able to out-vote the cattlemen, especially as the interests of the cattlemen were great enough to have an association of their own. The Territory he represented would be shut out by the proposed system of representation, and he was strongly opposed to it.

Mr. Gosper, of Arizona, referred to the National Convention of Live Stock Men held in Chicago in 1883. That Convention, he pointed out, had been called by the Agricultural Department for two purposes. One of these was to secure the passage of the animal industry bill, and the second was to call a second annual Convention of Live Stock Men to organize a permanent association. That second annual Convention had been held the preceding week in Chicago, but for the purposes of harmony it had been suggested that there should be but one National Live Stock Association instead of two. It looked as though there would be a division of the men from the Northwest and from the Southwest, but the olive branch had been held out, and it appeared as though they were to have one association and general harmony.

Mr. McCaskill then made a most earnest appeal on behalf of the cowboy and the cattle raiser. "I was the man," he said, "who made the assertion that this would run into a political organization. I believe I was the man who made that statement. I am willing to stand by that statement. I think

that I can prove to every man in this house that it is absolutely true. I ask the boys in the far West, that live in Wyoming, Texas, Colorado and New Mexico; I ask the boys that own the cattle; I ask you where you are to be found? You will find them in the spring of the year, when the grass is green, in the saddle—from that day until the snow falls. Then, if they are out in the saddle from spring until fall, they are not where they can get to any post office, and they cannot leave their places of business for the purpose of going to the State capital, and there meeting in Convention and electing delegates to a National Convention. Some of those gentlemen in Wyoming, in Texas and New Mexico, would have to travel from one hundred to one hundred and fifty miles on horseback for the purpose of getting to that Convention to have any representation. Then who would be the men that would elect delegates to this National Convention? It would be the men that have assembled around the capital—that are living there and want to attend the Convention. They would get together, and the vast body of men that live in Texas, Wyoming and New Mexico, that are out watching the heavens by moonlight, who by sunlight are in the saddle, they go without any representation. I do say that it will end in a political organization, and the object for which you and I are here to-day, as cowboys, from the West, would go down without representation—it would end in nothing. But what we want, and what we have come here for, is for the purpose of organizing that we may meet as cattlemen and look out for our interests. The gentlemen said a while ago that in Missouri they have no men who represent millions of dollars invested in cattle as they have in Wyoming. I ask you, have we come here to be represented by the dollars and cents that a man has in his pocket? If I have but a hundred cattle, and I am in the saddle, it is everything that I have. I am just as much interested in that hundred head as that man that owns his ten thousand that run upon the plains. Have I no voice because I am not represented?"

Before the discussion of the constitution was taken up, clause by clause, the Conference Committee, which had been appointed to secure harmony between the interests represented by the Convention held in Chicago the preceding week and the Convention then being held, presented its report. Mr. Curtis, of New York, on its behalf stated that it had been found impossible to finally agree upon an arrangement whereby only one association should be organized at this time. It was believed and hoped that in the future an agreement of this kind would be come to, but at present it appeared to be hopeless.

Judge Carey, of Wyoming, followed up Mr. Curtis' remarks with some strong expressions of opinion on the subject. As a representative of the great Northwest, he said that he and his colleagues felt very much like the peculiar animal known to cattlemen as a "maverick." He spoke as a representative of some fourteen associations that had been merged into the Wyoming Stock Growers' Association, and he wished to point out that there were men in the Northwest who, for four or five years, had been striving earnestly to secure that class of legislation which would benefit the stock industries of the country. He believed that if a convention could ever be got together that was composed of men engaged exclusively in stock growing interests, no question would arise that would separate or divide them. The Convention held in Chicago the preceding week was a Cattle Growers' Convention in every sense of the word, and the people of Chicago had not taken a part in it. It had organized a National Cattle Growers' Association of America, the purpose of which was to develop the cattle industry of the country. Their design was to have as members not men who sold cattle on commission, who sold hay to cattlemen, or who made a business of shipping cattle, but simply men who were cattle raisers. He failed to see how the Northwest was associated with Texas and the cattle industry. During the last ten years the Northwest had bought millions upon millions of dollars' worth of cattle in Texas, and he failed to see why Texas cattlemen would take the view they did in regard to this matter. The association with which he was connected (the Chicago organization) had selected as its officers men from all parts of the country. These included a representative shorthorn man, a representative Holstein man, a representative Jersey man and a representative plains man. If there were differences between the two newly-formed associations, let them get together and close them up.

Mr. Colman, of Missouri, in answering this argument, said that the Chicago association had made so little a ripple upon the stream of time, that he believed nine-tenths of the present Convention had never heard of it. If everything was to be controlled by the North, it was good-bye to the cattle industry. He wanted all sections and all people to unite in the cattle interest, and everything had been done that honorably could be done with a view to coming to an agreement. The policy adopted by

the other side of the question had been that those at Chicago were holier than those at St. Louis, and, although every desire had been manifested to yield points, nothing would be yielded in return. If they would allow the Chicago people to become the tail to wag the dog it would be all right, but the cattlemen, as represented in this great Convention, did not propose to allow this to be done, and he failed to see what hope there was for an agreement.

A number of motions were then made to amend the constitution, but, for the most part, they were voted down, and, finally, the constitution as printed above was adopted as the basis of operations for the new association.

The Committee on Resolutions called attention to the fact that it was the custom of certain railway corporations in the United States to furnish for the shipment of cattle over their lines of road boxed or closed cars only, thereby causing great danger to the shipper of loss of property, and discomfort, cruelty and disease to the cattle so shipped. It recommended that Congress be memorialized to secure legislation to compel all railway companies of the United States to furnish slat or special stock cars for the shipment of cattle. The resolution was adopted, and although there has not been much legislation on the subject, the evil complained of has been abated and a very superior grade of cars introduced.

This, practically, concluded the proceedings of what we have already described as, perhaps, the greatest Convention ever held. As we shall see later, the results were not what had been hoped, and we have already referred to the suggestion that the tremendous hurrah which characterized the gathering proved injurious to the trade and helped to reduce the profits of cattle growing. But this does not alter the fact that the Convention was a remarkable gathering, and one which will never be forgotten by any one who was present at the proceedings. All sorts of estimates as to the amount of money represented were made at the time, and the number of millions owned by those present was talked of in an undertone and with bated breath. Every branch of people connected with beef production was represented. Gen. Preston Porter, some of whose remarks we have reproduced, represented the American Indian with singular ability. As a member of the Creek Nation he spoke on behalf of his race in a manner which demanded and obtained recognition, and the information he gave concerning the relations between Indians and cattlemen were of the first importance. D. W. Lippe, Treasurer of the Cherokee Nation, and Chief Perryman, were other notable Indian representatives, while among the white men there were some of the most remarkable examples of courage and success. Those who attracted special attention, says Mrs. Augusta Wilson, of Parsons, Kan., in her review of the Convention, were: "Gov. Routt, ex-Gov. Stone, Gov. Eaton and ex-Gov. Gilpin, W. H. H. Cranmer, Finis Ernest and Andrew Wilson, of Colorado; ex-Commissioner of Agriculture Le Duc, of Iowa; and from the military ranks came Gen. Brisbin, of Idaho; ex-Gov. Hadley, and ex-Senator Stephen Wallace Dorsey, the great statesman and noted ranchman, of New Mexico; and from the great State of Texas came such notable and noble men as ex-Gov. Joseph D. Sayers, Hon. James F. Miller, Judge Carroll, Judge Lindsay, the silver-tongued orator and Congressman-elect from the Galveston district; Hon. W. H. Crane, also Col. E. R. Lane, and prince of ranchmen, Richard King, and that most popular drover of this or any other era, Col. John T. Lytle; and also that veritable living encyclopedia of 'brands,' Richard Head, accompanied by such solid millionaire ranchmen and drovers as Col. John Simpson, and Col. J. L. Driskill, whose immense herds crop the nutritive grasses of Montana; also Col. J. M. Day, the true-hearted, old-time drover and now solid ranchman; Capt. Ike Pryor, and the notable Col. A. H. Pierce, whose wealth and energy are equally and phenomenally large, and now last for Texas, but not by any means least, the name of the solid and model business man and millionaire, Col. Charles Goodnight, of the Pan Handle, and the courteous and dignified banker of Beaumont, Col. V. Wiess; Col. Carter, and Mr. Sheperd, and Loving, the Secretary of the Northwest Texas Cattle Association. From Illinois came as a delegate at large from that State that brilliant parliamentarian and shorthorn stockman, Hon. De Witt Smith, and Mr. Dunham, of great horse fame, both in the United States and in Europe; and from Chicago a very large representation, prominent among them was that noble, philanthropic gentleman, Dr. Wood, of Wood Brothers; and from the Empire State, New York, came the towering parliamentarian, Gen. W. M. Curtis, whose honorable service in civic and military fields alike fills pages of our country's grateful history; and from Kentucky, the home of the shorthorn, came the solid, matter-of-fact, brainy Col. Groom. From Missouri State came the earnest and able Capt.

James H. Payne, and from Kansas City the solid millionaire, Andrew Snider, and the philanthropic Thomas J. Allen, the Chesterfieldian Maj. Seth Mabry, and the chivalric Capt. E. B. Millett, and the noble-hearted connoisseur horseman, Col. S. S. Grant; and from St. Louis the towering headlight of the Convention, R. D. Hunter; the stately Capt. A. G. Evans, and James C. Moore, of the Merchants' National Bank, whose honor and integrity are as firm as the rock of ages. From Kansas came the Hon. L. E. Finch, and the eloquent and impetuous McCoy; and from Colorado and New Mexico and Arizona and California and Idaho and Nevada and Utah came a galaxy of men who already had national fame; and from Montana came the erudite Ames; from Nebraska, C. J. Davis, and from Wyoming came Judge Cary, and Mr. Curtis, Secretary of the Wyoming Live Stock Association; but to Colorado belongs the palm of furnishing the prince of scholars and orators, Dr. Moore."

Immediately on the adjournment of the great Convention the organization of the National Cattle and Horse Growers' Association was perfected. Col. R. D. Hunter was elected President, after having been nominated by Dr. Moore, of Colorado, who rejoiced, perhaps a little prematurely, in the fact that all animosities had been buried, and argued that harmony would be still further promoted by the election to the presidency of a man like Col. Hunter, who had worked his way up in the business by his own industry, and who could so ably represent both cowboy and capitalist. One or two other candidates were nominated, but every one was united in favor of the Colonel, whose election was really unanimous. Vice-Presidents from the different States and Territories were then announced. Alabama, Arizona, California, Colorado, Dakota, Delaware, District of Columbia, Idaho, Indian Territory, Illinois, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Missouri, Nebraska, Nevada, New Mexico, New York, Oregon, Pennsylvania, Texas, Utah, Alaska, Canada and Mexico were all duly represented on the roll of Vice-Presidents, but neither Wyoming nor Montana responded to the call. General fears were expressed that these States had jumped the Convention and were not going to give a very hearty support to the Association.

This fact was not allowed to interfere with the progress of events, and a strong Executive Committee was appointed. Mr. A. T. Atwater was made Secretary of the Association, and Mr. D. C. Moore, of St. Louis, Treasurer. A committee was appointed to take into consideration the foreign trade and commerce in cattle and beef products and legislation relating thereto, and to report at the next annual meeting of the association.

The fifteen members of the Executive Committee met in the rooms of the Colorado delegation immediately after being appointed, and the next place of meeting was the first question discussed. Denver, Chicago and St. Louis were the three contending places. The Western members stated that the majority of the delegates were from the West, and that Denver would be much more convenient. Chicago, while admitting the superb manner in which St. Louis had entertained the delegates, claimed that the great cattle interests of their city demanded recognition, and that the delegates would appreciate a change. For St. Louis, it was maintained that the three most important officers were here, and that St. Louis possessed, in the highest degree, the ability to handle conventions. This was so evident, that when a vote was taken, St. Louis received twelve votes, Chicago one, and Denver two. The Denverites gracefully withdrew in favor of St. Louis, but Mr. Dunham, of Chicago, solidly refused to ratify. It was, nevertheless, unanimously voted to hold the second session of the great Convention in this city, November 23, 1885.

The following sub-committees were then appointed:

On Branding—B. H. Roberts, Titusville, Pa.; H. Metcalf, Denver, Colo.; H. B. Denham, Brooklyn, N. Y.; J. S. Brisbin, Boise City, Idaho; E. R. Lane, San Antonio, Tex.

On Leasing Lands—Gov. Stone, Colorado; Col. Babbitt, Wyoming; Judge Carroll, Texas; J. S. Brisbin, Idaho; W. T. Thornton, New Mexico; Gen. N. M. Curtis, New York.

A sub-committee, with all the powers of the full committee to act under certain circumstances, left to the discretion of the Chairman, was then appointed, the members thereof being: M. W. Dunham, Wayne, Ill.; Colonel Hamilton, Richard Gentry, H. E. Salmon and J. L. Brush.

Thus one of the greatest national associations ever contemplated started out with every prospect of success. The reaction from the exceptionally high prices which marked the culmination of the great boom in the trade had already set in, and it was felt among the cattlemen that organized effort was

necessary for the protection of their interests. It would be pleasing, if it were possible, to record a long list of results of the association's work, such as we are able to do in a later chapter concerning the great Texas association. But truth compels us to record, as a matter of history, that the association proved a failure. The Convention of 1885 lacked the tremendous force of that of 1884, and showed that the unanimity between States and sections necessary to make an organization of cattlemen all-powerful was painfully lacking.

We need not go fully into the circumstances connected with the decline of what looked like being, at one time, an organization of tremendous, if not dangerous, power. In the words of one of its prominent officers, "it never died, it just slept." It passed resolutions in large numbers, and sent memorials to Congress and to State Legislatures very frequently. But it failed in point of action, just as did nineteen-twentieths of the long list of cattlemen's associations represented at the Convention and published on a preceding page of this chapter.

A well-known cattleman, not a resident in Texas it may be added, was asked by the writer his opinion as to how it was the association, and so many of the smaller organizations represented in it, failed to mature in the manner expected, and hence passed out of existence without achieving the desired results. "The only reason I can suggest is that there was too much theory and not enough practice in the policy adopted," said the gentleman referred to. "I remember, not long ago, a colored man in my employ joined a political organization, and for a long time seemed exceedingly proud of his connection with it. After awhile the organization seemed to lose favor in his eyes, and one day, when I asked him how it was getting along and what it was doing, 'Oh,' he said, with something of a sneer, 'we don't do nothin'; we just resolute and resolute, and that's all.' Without meaning any disrespect toward the cattle associations which died of inanition, it seems to me that my darkey's description of the *modus operandi* of his society fits them exactly. The cattleman and the cowboy are busy people, exceedingly practical in their ideas and averse to a mass of words. The only time that the Northwest Texas Cattle Raisers' Association was in any danger of disruption was when it lost sight, for a short time, of its main purpose, and tried to achieve results by memorials. Directly it braced up, and resumed practical work, its strength became greater than ever, and it is to-day a power for good, not only to the Texas cattleman, but to the cattle industry of the country generally. Its programme has been clean-cut and defined, and it has spent its money and energy on an effort to put a stop to cattle stealing. The results of its work have been extraordinary, and as "deeds rather than words" is still its policy, it stands a chance of rising to still greater importance. If the other associations throughout the country had turned their attention to practical, every-day matters which they could control or influence, instead of going into abstract theories and sciences, they would certainly have achieved great results and been in good shape to-day."

Another well-known cattleman expressed his view on this subject in the form of an interview which was published in the winter of 1887. "Up to the fall of last year," he said, "it had been the rule among stockmen to ship no cattle to market younger than four-year-old crib steers. Last fall a few cows and calves were sent to the stock yards and sold, and even then the stockmen who were doing it were severely criticised. The explanation then generally given was that the ranges were overcrowded and that the owners wanted to get rid of the cattle. Early this year the stockmen began to ship yearlings, cows and calves into the yards in such large numbers, that it became evident there must be some other cause for their desire to clear off the ranges. There was another explanation, and this was debt. According to the books of the stock yards company there were in 1886 no less than two hundred and fifty-seven thousand cattle shipped to the East St. Louis stock yards and sold there. These were mostly beef cattle. For the past ten months of this year there have been forty-five thousand more cattle shipped to the yards than were in the whole of last year. Of these, the cattle inspectors stationed at the yards say, fully one-half have been cattle that should not have been put on the market, and would not have been shipped two years ago. It is quite true that the cattlemen in some parts of the Northwest and Southwest have found that they made a mistake by overcrowding their ranges with stock, and are trying to thin out their herds by shipping the worst of their cattle to market; but the shipment of the immature beef cattle are due more to the pressure of the stockmen's creditors upon them. They have been getting into debt ever since 1884, when the cattle business appeared to every-

body to be the best speculative investment that could be found for loose money. Two years before that Texas cattle had sold in the stock yards for seventy-five dollars a head, and for three years the cattlemen all thought they were going to be millionaires.

"These were the days of the cattle king and of vast wealth in cattle, when the stock grower counted his assets on paper. He had so many thousand head of cattle on his ranch worth thirty dollars and more per head. He mortgaged his cattle for their full value and bought more cattle to put on his ranges. Then came a succession of heavy blows to the stockman, and those in Texas suffered most. The cattle began to die on the overcrowded ranges because of bad water, scarcity of feed and extreme warm weather. Texas passed a law to compel the cattlemen to pay rent for their ranges. At first the States charged them eight cents an acre for the dry lands and twenty cents for the watered lands, but afterward reduced the range rent to four cents an acre for all kinds of lands. The Texas stockman counts twenty acres of land as barely enough pasturage for one head of stock, and that four cents rent meant eight thousand dollars a year to him if he had ten thousand cattle. The supply of beef greatly exceeded the demand in this country, and Europe, beginning to import its beef from Australia and New Zealand, got less and less from America. The price of beef fell rapidly, growing lower every year after 1884, until now it is not one-fourth what it was in 1882. An average price per pound for beef on the hoof then was four and one-half cents, now it is about one and one-fourth cents. Loss by death followed loss by decrease in price until the cattlemen grew discouraged, lost heart and began to try to sell out of the business. But they found no one to buy. The jubilant Cattlemen's Conventions of 1883 and 1884 became meetings in 1885 for the purpose of exchanging condolences with each other, and in 1887 they were not held at all. Several failures of heavy cattlemen added to the panic in the business, and the cattlemen finally almost grew to believe that their herds were not worth the salaries of the cowboys paid for watching them."

So far as the National Cattle and Horse Growers' Association is concerned, it was also hampered and injured by a feeling of sectionalism. The old Chicago and St. Louis feud was allowed to interfere with it at the very commencement of its career, and the feeling of antagonism between the Northwest and the Southwest, which at times came to the surface during the big Convention, grew instead of declined as time passed on. As far as possible, controversial points are not dealt with in this book, and hence it is unnecessary to go into details on this point. We have shown, at some length, how grand and important the Convention was, and we have done so because we regard that gathering as an infallible mirror, depicting the condition of affairs which prevailed when the cattle industry of the West and Southwest was at the very zenith of its greatness and prosperity. In the next chapter we shall, with the same object in view, consider the range industry as it existed about ten years ago. It will also be necessary in this connection to trace the causes which led to the falling off in the industry's prosperity, and the evening-up of matters of the cattleman's grievous discomfort and heavy loss, not omitting a few remarks on the next cycle, and on the dawn of renewed prosperity for the last few years of the century.

CHAPTER VIII.

The Condition of the Cattle Industry Just After the Great Boom.

IN the preceding chapter attention was drawn to the immense importance of the Cattle Convention of 1884, and also to the interest this Convention attracted in all parts of the country from all classes of people. Mention was also made of the fact that some people, not necessarily habitual pessimists, took the view that the Convention was ill-advised, because the extraordinary prosperity, and in some cases immense wealth, of cattlemen was brought so prominently to the front that many were induced to a false belief as to the profits to be made out of cattle raising and the impossibility of losing money in the business.

One immediate result was attracting the attention of the Government to the cattle industry, resulting in the prosecution of inquiries in a manner never before attempted. Much benefit was derived from the efforts made in this direction during the years 1884 and 1885, and especially the latter year; and to Mr. Norman J. Colman, then just appointed Commissioner of Agriculture, the industry is indebted for the first really thorough investigation made. Mr. H. M. Taylor prepared for Mr. Colman a most valuable report on the importance of the range industry of the United States. In this report Mr. Taylor called attention to the fact that the cattle industry of the great West represented at the time mentioned, or about ten years ago, in its annual results, nearly two million beef steers added to the food supply of the world. It was true that quite a large per cent of these (fifteen to twenty-five) were sent to the corn belts of the old West and ripened, but the carcasses were grown on the plains. This was about one-third of the annual beef supply of the whole United States, and if cut off would create a beef famine in the land. Under these circumstances it was important that the West should be encouraged in the direction of continual production. With this great beef reserve to draw from, the working classes of the East were scarcely able to buy adequate supplies. Without this resource, prices would advance to such an extent that only the rich could eat beef at at all.

The prominent cattle ranges he found to be in the arid regions. Large areas on the edges of these regions had been used as ranges in the past, but the farmer with his plow had now taken possession of such places, and the herds were naturally driven to the bad lands, and such places where agriculture was actually impossible without irrigation. This movement was, and is, strictly in harmony with the laws of nature. Every district of country in the United States that is susceptible of cultivation, and that, without artificial water supplies, will respond to the touch of the husbandman, is the legitimate inheritance of the farmer, and will sooner or later fall into his hands. Such lands are not suited for range purposes, for the reason that whenever the natural rainfall is sufficient and frequent enough to produce a grain crop, the grasses remain green and full of sap until the frost kills them. With the coming of frost goes all the nutriment of grasses not matured, and the wood fibre remaining will not support animal life. Thus, the simple fact that any given region affords a cured and nutritious grass for winter feeding is proof positive that it is not adapted to agriculture, and that the ordinary farmer would only fail if he attempted to live by the plow. "There are millions of acres of this arid region," the report went on to say, "only suited for grazing fields, and in future legislation touching the public domain, the leading idea to be kept in view is this one question of properly separating the arid regions from the agricultural. With rare exceptions, the talk about herd-owners 'bulldozing' and driving out would-be settlers and farmers is pure fiction. For the reason above set forth, the farmer who would attempt to settle and make a farm on any cattle range in the arid regions would be deemed a lunatic by well-informed persons. With more light on Western range subjects, and especially more information as to the character of the land occupied by the roving herds, a wonderful change would come over the minds of the Eastern people. There is really no antagonism between the grazing and farming interests of the West, because there cannot be, according to the nature of the country, any conflict. Nature has drawn the line of demarkation, and until that same Nature overrides her laws there can be none."

Experience in the Southwest had shown that under proper management, with careful breeding and plenty of water, from ninety to ninety-five per cent of calves could be raised. There was less tendency to put on flesh in this district than in the more Northern country. The grasses, while abundant and of sufficient nutritive qualities to build muscle and bone, and give the animals a round and shapely outline, did not possess sufficient sugar and starch to lay on flesh rapidly. On the great open plains, breeding cattle was not found so profitable. The average calf crop for a series of years had scarcely reached fifty per cent., and so long as cattle drifted as they did this percentage could hardly be increased. Cattle fattened very rapidly in the Northern country. Shrewd operators of the North had for years been buying young Southern steers, and placing them on their ranges to mature and prepare for Eastern markets. Experience had proved that a two-year-old Texas steer would gain two hundred pounds in weight when double-wintered on a Montana range than if left on its native plains.

A very large percentage of the cattle on the Northern ranges had been graded up from Texas cows. In 1881 there was a large drive from Oregon and Washington Territory, and since that time a good many young cattle and some cows had been shipped in from Iowa, Minnesota, Missouri and a few other States. These "pilgrim" cattle from the East have not shown as ready an adaptation to the range life as the Western and Texas imports, and the tendency was rather to discourage the traffic in them. "Raised on the pitchfork, so to speak," says Mr. Taylor, "they know nothing of self-dependence, and when the winter storm strikes them they naturally look for man's help and fail to 'rustle' for themselves. On the contrary, the Western and Southern cattle for generations have had to make their own provisions for winter, and they are always found hunting for something to eat. But the Southern cattle are light in weight, and as increased weight means profits, Northern ranchmen have for years been buying high-grade bulls from the East and grading up their herds. The native cattle to-day, on most Northern ranges, are as good, or perhaps a little better, than half-breeds. Shorthorns and Herefords are, as a rule, the improved breeds used, and our three and four-year-old steers weigh from eleven hundred to thirteen hundred pounds in the Chicago markets. This makes a very profitable animal when the markets are not broken by too large receipts; and the question is being generally discussed among ranchmen as to whether the herds are not sufficiently graded up to be safe and profitable. A few herd owners claim that a thoroughbred animal will sustain as much hardship and do as much 'rustling' for food as the scrub or grade.

"But the general opinion is that the 'rustling' qualities belong to the scrub, and that grading up means a larger carcass at the expense of the ability to endure the necessary hardships of our Northern winters. The practical point to determine is, how high can we grade up without losing the self-sustaining qualities? Large, well-shaped and weighty cattle are desirable, but if the mortality is increased beyond the gain in size, the improvement is a mistake. Sufficient experiment has not yet been made to definitely determine this point. Present information leads to the opinion that in time there will be established a fixed type of range cattle, something better than a half-breed shorthorn or Hereford, but developed by a blending of the best-suited beef brands. The Swiss cattle have been produced in this way, and they are a very good 'all-purpose animal.' No particular strain of blood can be traced in them, yet they are uniform in characteristics. Range animals, built up after a good model and uniform in size, containing all the improved blood consistent with a retention of the 'rustling' qualities, would have a tendency to create a more uniform market. At present the periodical breaks in the beef market are caused by sending in unripe animals, or those that are ill-shaped, in undue proportion. Uniformity in size and appearance will do much to maintain evenness in market values."

Diverting to the trail question, which had attracted so much attention at the Convention in the preceding year, Mr. H. M. Taylor said:

"I have received assurance from prominent Texas cattlemen that Texas will arrange within her own territory for a right of way to her northern border. This will give her cattle an outlet to the Neutral Strip belonging to the Government, situated between the Pan Handle of Texas and the States of Colorado and Kansas. As the Administration has taken strong and positive ground in favor of the right of way for Southern herds through the Indian Territory and Neutral Strip, it will be seen that an outlet for Southern cattle is at the present time secured to the southern line of Colorado and Kansas.

The quarantine regulations of the State of Colorado permit the admission within her borders of all cattle that may receive a bill of health from the State Sanitary Board. As this board has decided to admit all healthy cattle from Texas that have been driven all the way from their native ranges, the question as to a Northern outlet for Southern cattle is practically settled. In order, however, to avoid friction, and to accomplish the greatest good to the greatest number, with the least possible hardship, I would suggest that the Government withdraw from market the public land along and within the line of Eastern Colorado to the extent of a strip three miles wide, and extending from the southern line of Colorado to the Arkansas River, the distance being but seventy-five miles, and the amount of territory embraced being but two hundred and twenty-five sections, or one hundred and forty-four thousand acres."

When we reflect on the millions of acres that have been given outright to corporations, this request upon the part of so vast an interest as the great Western cattle industry, was, as Mr. Taylor argued, certainly modest and reasonable by comparison. The request appealed for favorable consideration on the further ground that title to the territory was not asked for, but the mere right of way during a short season of the year, in the interest of interstate commerce in healthy cattle for the benefit, not only of the stock growers, but the entire people of the United States. The drovers had already secured by the actual purchase of land in Colorado on both sides of the Arkansas River, at the eastern State line, a right of way over that stream. Mr. Taylor was assured by the gentlemen who had invested their money in this right of way that they would make it free to the owners of all healthy cattle who might desire to use it in moving their herds to Northern ranges. The cattlemen interested in moving their herds from Southern breeding grounds to Northern maturing ranges would cheerfully purchase, at full value, water privileges along this proposed route from individual owners, which would prevent any injustice being done. The Las Animas County (Colorado) Cattle Growers' Association, whose ranges lay adjoining the Neutral Strip on the south, and extended to the Kansas Line on the east, took action in the season of 1884 in favor of laying out a trail three miles wide along the east line of their county, which covered forty-four miles, or more than half the distance from the southern boundary of the State to the Arkansas River.

"I had a conference in Denver, Colo.," Mr. Taylor proceeds, "with quite a number of representative Colorado cattlemen, and also with members of the Executive Committee of the Colorado Cattle Growers' Association, and they assured me that they desired a trail laid out along the line stated. This is a matter of great importance to Colorado, for the reason that the country north of the Arkansas River is best adapted for the maturing of steers, of which thousands are annually purchased in the South to fill up the ranges depleted by the annual sale of beeves. The cattle industry of New Mexico, Arizona, Texas, and the Indian Territory will be greatly promoted by the maintenance of a right of way or trail over the route named, for the reason that the greatest profit to be realized from their investments in cattle depends on the success of the yearly movement of their young steers to the maturing ranges of the North; and the ranch owners of the North, who are finding their greatest profit in the maturing of Southern steers, are also interested in the success of this important matter. The price of beef is so largely dependent on the product of our Western ranges, that every man, woman and child in the United States is interested in fostering this great industry, and in seeing that all reasonable aid is extended to it by the General Government. The strip of country along the Colorado east line is devoid of settlements, and is in the arid regions, where farming cannot be successfully conducted without irrigation, and irrigation could not be employed at any point along this proposed line except where it is crossed by the Arkansas River, where right of way has already been secured. The grasses along this route are excellent in summer, and are much more abundant than the grasses near the mountains. As a winter range, this section is more dangerous than the ranges further west, because of the absence of shelter, and in consequence is practically unoccupied.

"The interests of the great breeding sections of Southern Colorado, New Mexico, Arizona and Texas are mutual, for the reason that prices of young cattle vary according to grade. Cattle from the Northern breeding sections are higher graded than those from the Southern districts, which enables equal profits to be made by purchasers of young steers from all sections at proportionate prices based on values, determined by grades. For these reasons there is no competition between the sections named,

and they unite in desiring measures that will prove of equal benefit to them all. The trail from the Southern Colorado line north would be a non-infected trail, on which native cattle from the non-infected districts could be moved with perfect safety. The Southern end of the trail in Texas would be dangerous, but cattle that have been moved from the infected region a sufficient time to purge themselves of the contents of their stomachs, free themselves from infection, and are no longer dangerous. The railroads having Southern connections in the non-infected districts would be largely benefited by the opening up of the trail indicated, for the reason that it is reasonable to presume that they would secure a satisfactory portion of the cattle seeking outlet North, which they would ship from Southern points and unload where the railroads crossed the line of trail. The Northern railroads interested in the movement of beeves to Eastern market would secure four times the present amount of business if the movement of young steers from Southern to Northern ranges was properly fostered. With the Northern ranges stocked with mixed herds of cattle, not over a sixteenth of the number will ever be marketed for beef within a given year, for the reason that mixed herds on the favored Southern ranges, where every cow is supposed to raise a calf, represents cows, calves, yearlings and two-year-olds in about equal numbers, and the offspring being equally divided as to sex, but one-eighth of the entire herd go to make up the yearly beef products. The increase on Northern ranges being one-half less, makes the available beef product but one-sixteenth of the mixed herd in each year."

In this connection it is interesting to point out that the cattle-drive from Texas, which was about four hundred thousand in 1880, fell off about a quarter of a million for the years 1881, 1882 and 1883. It rose again to over four hundred thousand in 1884, but fell off to three hundred and fifty thousand in 1885. Many arguments were adduced, based upon these figures, showing the absolute importance of the proposed trail. The "CHICAGO DROVERS' JOURNAL," in an issue published at about the time the report was prepared, mentioned a sale of a number of beeves from a Dakota range which averaged twelve hundred pounds each and which sold for sixty-two dollars and fifty cents per head. Deducting about seven dollars and fifty cents per head for feed and commissions, this left a net price of fifty-five dollars per head, twenty dollars per head more than the cattle would have netted if they had been matured on the Cimarron River in the Indian Territory where they were bred. These cattle were moved North under very auspicious circumstances, and the establishment of a trail as suggested would make this class of work much more satisfactory. Prices were depressed at this period, but smooth, fat beeves fetched high prices still, and millions of dollars were evidently being lost by reason of the marketing of unripe cattle, and by the need of a trail through Texas and the Southwest to Montana and the Northwest.

Turning from the trail question to railroad transportation, Mr. Taylor speaks of the great importance of improved accommodation. In the shipment of cattle by rail in the ordinary cars, he pointed out, serious injury was frequently inflicted upon the animals by the sudden stopping, starting and jolting. The new parlor cars, while very suitable for stall-fed fat cattle, did not answer well for the wild steers of the Western ranges. A great deal of the injury to cattle by rail could be avoided by judicious handling en route. The cattle were generally on the road for a number of days, and were wholly unable to obtain adequate rest from the start until they are finally unloaded. As a matter of course they could not rest in the cars, and when unloaded for feed and so-called rest, they were generally crowded into pens so closely as to make it impossible for them to lie down. "Range cattle," says the report, "must have room to lie down without coming in too close contact with each other, or they will remain on their feet, no matter how great their fatigue. Then the stops for feed and rest required by law are generally planned to take place during the day, a time when wild cattle are kept constantly disturbed by the strange sights and confusion constantly around them. If these stops for rest were arranged to take place in the quiet of the night, it would enable animals to get the desired and greatly needed rest. This plan would have the additional advantage of keeping the animals as cool as possible during transit in summer, for they would rest during the cool hours of the night, and in the heat of the day they would be kept cool by the current of air resulting from the motion of the cars.

"Too much importance cannot be attached to the matter of securing good, nutritious hay for feeding cattle in pens while resting, of which a full supply should be furnished. Shippers sometimes, from false motives of economy, do not half feed their cattle, and the hay which is frequently supplied

by the railroad and stock companies is of such poor quality as to be of little value for food. Stock yard companies should be required by law to supply the very best of hay, and furnish full feeds to all animals stopped off in their yards, whether the owner or shipper orders it or not. The limit of time that cattle are permitted to be run on cars without being unloaded for feed and water should be computed from the time the loading of the cars is commenced to the time when they are unloaded. Very often cattle are loaded on cars and then side-tracked and delayed, and are held in cars after stock yards are reached for a considerable time without being unloaded and fed. Heavy penalties should be enforced for violations of these greatly needed regulations.

"Cattle should, if possible, always be shipped in train-load lots, and special runs secured by which right of way is obtained in preference to trains carrying dead freight. With proper care in unloading

RANCH SCENE IN SOUTHWEST TEXAS.

cattle, avoiding crowding too many in a car, and proper attention on the part of the shippers in charge keeping the cattle on their feet while in the cars, and avoiding runs of over twenty-four to twenty-eight hours, with rests at night in roomy pens, with pure water and abundance of nutritious hay, cattle can be shipped from extreme Southern Texas to Northern ranges without any material loss."

So much attention having been given to Texas fever, it was only natural that a man of Mr. Taylor's observation should note that the United States had been greatly disturbed by the prevalence of another disease which not even the most severe critic of the Lone Star State could attribute to it. This was contagious pleuro-pneumonia, against which quarantine measures had been adopted. It was estimated by some that the State of Missouri alone suffered to the extent of one million dollars by reason of the depreciation of the values of cattle in her borders, on account of being practically shut off for a time in marketing her cattle, owing to the outbreak of pleuro-pneumonia in Callaway County. Radical measures were necessary, not only to stamp out what contagious disease exists among the herds in our country, but also to prevent the introduction of diseased animals from countries where infection prevails. We could never permanently free our country from the bane of contagious bovine diseases without shutting out all cattle from foreign countries where contagion exists. "Why should our Government," asks Mr. Taylor, with much force, "permit importations of cattle from foreign countries where contagious cattle diseases exist, when these countries, especially England, prohibits entirely the admission of cattle from the United States? 'It is a poor rule that will not work both ways.' 'An ounce of

prevention is worth a pound of cure,' and we can never hope to keep our herds permanently free from disease while cattle are admitted from countries where contagious cattle diseases were known to exist. If a single infected animal introduced into Australia caused a loss from pleuro-pneumonia of over forty-four million dollars, it will be seen that the responsibility which is placed on quarantine officials is too great to insure with certainty that no infected cattle will gain admission."

As Mr. Taylor argued in 1885, and what is equally true ten years later, there is too much money invested in the cattle industry of the United States to permit of any chances being taken. "I am aware," he says, "that I will incur the opposition of a class of live stock papers, largely subsidized by importers, in the radical stand I have taken in this matter, but I feel that my highest duty is to the cattle owners of the United States, and the interests of a few traders and subsidized newspapers sink into insignificance when compared with the other vast interests at stake. While I admit the advantage to be derived from the infusion of new blood into our herds, it is small as compared with risks attached to its introduction. I voice the views of the major portion of the prominent range cattlemen of the West in the views above expressed."

Another very interesting question arose in regard to prices. In some portions of the range country, it was pointed out, a mistaken notion had prevailed in regard to getting cheap Southern cattle. It was argued by some that if the price of young cattle in the South was depressed, the margin to the drover or the purchaser from the North, who went South to buy, would be increased by the amount of the depression in the South. Results had proved this a fallacy. The blockading of the drive the previous season, and the quarantine against Texas cattle from below the thirty-fourth parallel, caused a shrinkage of over five dollars a head on all classes of Texas cattle, but in sympathy with that decline values had gone off equally as much all along the line from Texas to Montana. And this would always be the rule. There was, and still is, a sympathetic connection between values of any article of traffic that is as certain and true as the magnetic needle. Commerce is Argus-eyed, and at once discovers the means of restoring any temporarily disturbing equilibrium in trade and values. The cattle industry of the whole country is interested in maintaining prices at all points. Temporary gains might be realized by remote sections, where the supply was inadequate to the demand, by, for the time being, disturbed values; but the reaction always comes, and when it does come it works permanent hardships. The true policy of Montana, Wyoming, Colorado, New Mexico, Texas, and other cattle countries, is to combine with each other, and, through compromise and comprehensive intelligence, work out a system of co-operation based on honor and justice.

It was evident, in 1885, that every year brought the interests of the ranchman and farmer nearer together, and that they were equally important factors of a necessary system. The steadily advancing value of farming lands necessarily made the life of a steer, from calfhood to maturity, a period of expense to the farmer, which materially reduced the profit when the animal was ready for the shambles. On the other hand, while the ranchman in the breeding sections bought a steer at the age of three years, at a comparative small expense, he had no facilities for obtaining that additional profit to be realized from the hardening process of feeding, and each acting independently was deprived of the advantage and profit that would be realized by operating together for mutual profit and benefit.

The range country east of the Rocky Mountains, Mr. Taylor pointed out, covers an area of open country two hundred to three hundred miles east and west, reaching from British America south to the Gulf of Mexico. Going south the trend of the mountains is to the west, and the plain country on the thirty-sixth parallel is not far from six hundred miles east and west. Over this wild expanse of almost treeless plains the cattle roam at will, and are frequently found hundreds of miles from their home range. Freedom of action is the insurance on their lives, for they walk in front of the blizzard until they find shelter or the storm abates. When spring comes a small herd is found scattered over an area of, perhaps, hundreds of miles. They must be gathered and the calves branded. To facilitate this work the round-ups were instituted, and the spring hunt for cattle meant an organized army of cowboys scouring the whole country. Mess-wagons were loaded with provisions, and a cook employed who drives the four mules or horses, and cooks for the ten or fifteen cowboys attached to the mess.

These boys were sent by ranchmen in ones and twos, with from half a dozen to twenty or more wagons, depending upon the number of cattle they represented. The men with three or four hundred

head of cattle found them as widely scattered as were the ten thousand of his neighbor. In order to gather his cattle he must have a representative with the outfits in the various directions the cattle drifted. This created an annual expense beyond the limits of the purse of the small holder, while to the owner of thousands of heads it was but a small per cent on the number of animals gathered. Thus the round-up system, while it was perfect in itself and enabled ranchmen to find all their strays, and return them to the home ranch, was too expensive for the owner of a few hundred cattle. It cost as much to run a bunch of five hundred cattle on an open range, and find all of them in the spring, as it did to run three thousand. And it cost virtually as much to run three thousand head as it did to handle ten thousand. Under these circumstances and conditions there was, ten years ago, a present and growing tendency among small operators to pool their issues and organize cattle companies out of their combined herds. By this means the annual expense per capita was reduced, in many instances, from three dollars to less than one dollar. The large companies were made up, as a rule, of combined capital from the East, taken in small blocks, and very frequently the funds so invested were widows' savings and orphans' legacies. Hence they appealed in strong terms to the public for the same kind and degree of protection that would be accorded to them if invested in any other class of business or securities.

Mr. S. H. Standart, another Inspector of the Bureau of Animal Industry, devoted several months of the year 1885 to a careful investigation of the condition of the live stock industry of Colorado and Territories of Dakota and Montana. In view of the great variation in estimates as to the number of cattle in those regions at the time, his report is of great value, and it is not by any means out of date. From the result of his investigations, it appears that at the close of the year 1884 the number of cattle and their value was as follows:

State or Territory.	Number of Cattle.	Estimated Value.
Colorado	1,224,310	$38,542,800
Dakota	484,312	13,500,000
Montana	826,648	24,700,000
Total	2,535,270	$76,742,800

Nine months later there had been a marked increase in the number of cattle, and the figures for Colorado, Wyoming, Montana and Utah were as follows:

State or Territory.	Number of Cattle.	Estimated Value.
Colorado	1,420,388	$42,611,640
Wyoming	1,515,763	55,743,823
Montana	1,200,426	42,014,910
Utah	445,000	12,237,500
Total	4,581,577	$152,607,873

In order to obtain the information desired, circulars were addressed to cattle traders and rangemen generally, and their replies very carefully tabulated. It was found that the breeds generally in use were Durhams and Herefords, and their cross with native Texans. In Colorado alone nearly fifty million acres, or seventy-five per cent of the area of the State, was devoted to pasturage, and in Montana seventy million acres, or about the same percentage, was similarly used. The annual increase in cattle in Colorado was found to be about twenty-five per cent, while in Dakota and Montana the increase was as high as forty per cent. Most of the cattle were shipped to Chicago and other markets when between the age of two and six years. The rates from Colorado averaged $7.89 per head to Chicago, the rate from Dakota being about six dollars. From the figures before him, Mr. Standart estimated that the cost of feeding an animal on the range in Colorado until fit for beef was about $8.40, or nearly twice the cost in Montana. In the former State the loss during the preceding winter from want of shelter was about four and a half per cent, and the loss of flesh during the winter from the same cause was estimated at about twelve per cent. In Dakota the loss from both causes was larger. The annual increase in cattle at this time was fully sixty per cent in Colorado, fifty-four per cent in Dakota, and eighty-four per cent in Montana, importations as well as natural increase being included in these averages.

The general condition of the cattle industry of Colorado at the time was found to be very good. It was even admitted that not a single case of Texas fever had been found in the State during the preceding twelve months, although there had been over a hundred thousand Texas cattle brought into and through the State during that period. In Wyoming the condition of affairs was equally satisfactory. During the preceding year this State had shipped to Chicago and Eastern markets one hundred and sixty-seven thousand beeves. These had been sent by rail in common stock cars at an average cost for freight of about $7.60 per head. The losses on the ranges in Wyoming from lack of shelter during the preceding winter had been very small, and those from Utah had been estimated at less than five per cent.

In Wyoming the losses on the range of native or acclimated stock for the preceding winter had not been up to the average. The losses on cattle brought into the Territory from other States and Territories (those from Texas are called "rawhides," and those from the Eastern States "pilgrims,") the previous winter had been very serious in some localities and moderate in other sections of the Territory, the losses depending largely on the condition of the cattle and the season of the year they were turned out on the range. The reports on the losses of "pilgrim" and "rawhide" cattle showed a wide difference, and vary from three to fifty per cent, the average being about twenty-one per cent. Taking the average of all reports on all classes of cattle for the winter of 1884-85, the loss was five and one-tenth per cent in the Territory.

In Wyoming there was no disease of a serious nature existing among cattle, owing to the "very efficient" quarantine laws existing, which were fully and timely promulgated by the Wyoming Stock Growers' Association, through its President, Hon. J. M. Carey, and its Secretary, Hon. Thomas Sturgis. The Territory had suffered no material loss from contagious diseases, and during the twenty years that cattle had ranged in that Territory, there had never existed any contagious or other serious malady. It had been the experience of the cattlemen of the Western and Northwestern States and Territories that there was no cattle disease, contagious or otherwise, indigenous to the country, and with proper quarantine laws enforced, the Western States and Territories could be absolutely protected from exotic or contagious diseases.

A further series of investigations as to the condition of the live stock industry west of the Mississippi River was made by Mr. Lawrence Wilson, also an Inspector of the Bureau of Animal Industry, and Mr. J. M. Bradley, one of his colleagues. From investigations made over an immense area, a vast amount of information was acquired, and the following table is reproduced because it is really the most practical summary of results in existence concerning a period of exceptional importance to the cattle trade of the country as well as to the West. The table was as follows:

States and Territories.	Number of Cattle.	Number of acres devoted to grazing.	Number of cattle devoted to dairy purposes.	Annual consumption.	Value of the cattle trade.	Cost of transportation to Chicago, per head.	Cost of transportation to St. Louis, per head.	Cost of transportation to Kansas City, per head

The report as to Kansas is of value in many respects and covers a large area. Shorthorns, crossed with Texas and native cows, were found to be the most popular breeds, with Holsteins, Devons and Herefords following. Reports from correspondents gave the annual rate of increase from ten to ninety-five per cent. For the production of beef, shorthorns took the lead; then followed the Hereford breed, the Polled Angus and the Galloway. They were marketed at from two and one-half to three and one-half years of age. When sold at two and one-half years of age, they were usually purchased from ranchmen by parties who ripened them on corn and sold them at the age of three and one-half years. The animals were generally transported in common cattle cars to market. The cost of transportation was as follows: To Kansas City, two dollars and fifty cents; St. Louis, three dollars and fifty cents; Chicago, four dollars and fifty cents. It costs to raise a steer on grass and forage, from two dollars to eight dollars per annum; to grain-feed, from thirty-five dollars to forty-five dollars. The condition of cattle on ranches was generally good from the first of June to the first of January. If well fed and cared for they were usually in good flesh in the spring, but if not, they were very poor. On farms, they were protected in the winter season by barns and sheds, but on ranches they had but little protection or shelter of any kind. When sheltered and well-cared for, the loss was usually about five per cent. The preceding winter, where the stock was greatly exposed, the losses were twenty-five per cent. In some instances the losses exceeded fifty per cent.

The cattle fed for market in Iowa were found to be mostly grade shorthorns, and the most acceptable breeds for the dairy were Holsteins, Jerseys, shorthorns, and natives, in the order named. Correspondents give the annual rate of increase of cattle in the State at from ten to thirty per cent. The breed best adapted to beef production was the grade shorthorn. The animals were marketed at from two and one-half to four years of age. They were generally shipped to market centers by rail in ordinary stock cars. The cost of transportation to Chicago was from one dollar and fifty cents to five dollars per head. In this cost was generally included that for feed, yardage, and commission at point of destination. The condition of animals from May 1 to January 1 was generally very good. From January to May they were thin in flesh unless well sheltered, fed and watered. The average loss for want of shelter and proper attention was about two per cent. Great improvement could be made in the facilities for transportation of stock by railroads. Lower rates should be charged, and larger and better cars and faster time for stock trains should be afforded. Cattle were affected with but few diseases. A few cases of murrain and black-leg, and an occasional outbreak of Southern cattle fever, were about all that were mentioned. The losses from disease did not exceed one per cent.

In Nebraska, grade shorthorns appeared to be the most popular breed for rearing and fattening for the market. The most acceptable breeds for dairy purposes were Jerseys, shorthorns and Holsteins, preference being given in the order named. Correspondents variously estimated the annual increase in cattle, some rating it as low as ten per cent, while others believed the increase to be all the way from fifty up to ninety per cent. Shorthorn and Hereford grades were the breeds regarded as best adapted to meat production. They were usually marketed at the age of four years. Two-year-olds generally went into the hands of stockers, and were full-fed on corn for one or two winters. Cattle were carried to market in common stock cars. The cost of transportation was three dollars and fifty cents to Kansas City, four dollars and fifty cents to St. Louis, and five dollars and fifty cents to Chicago. It cost thirty-five dollars per head to grain-feed and fatten animals. The condition of cattle on farms and ranches was good from June 1 to January 1; the balance of the year, if not well fed and sheltered, they were usually in very thin condition. The character of shelter afforded them during the winter season included barns, sheds, walls, timber and thickets, banks, bluffs, etc. The annual loss from lack of shelter was five per cent.

Mr. Wilson concludes his observations with a singularly fair statement as to Texas fever, which must have been received with a considerable amount of surprise and annoyance by some of those learned people at Washington who, having established a theory, had been for years leaving no stone unturned in their effort to prove it by actual or imaginary figures. "I am glad," wrote Mr. Wilson in September, 1885, "to be able to state that there has not been, so far as I have been able to learn, an outbreak of Texas fever or any other contagious or infectious disease within the Territory assigned me, and that there is at present no immediate prospect of such a calamity befalling us. Thousands upon

thousands of Texas and other cattle have been removed from one point to another without causing or spreading any disease, a thing never before known, and since this movement has only been permitted under the supervision of laws, State and national, after strict sanitary and veterinary inspection, the public in general, and stockmen in particular, see and feel the benefits arising from the enactment of such laws and the enforcement of all necessary veterinary and sanitary regulations.

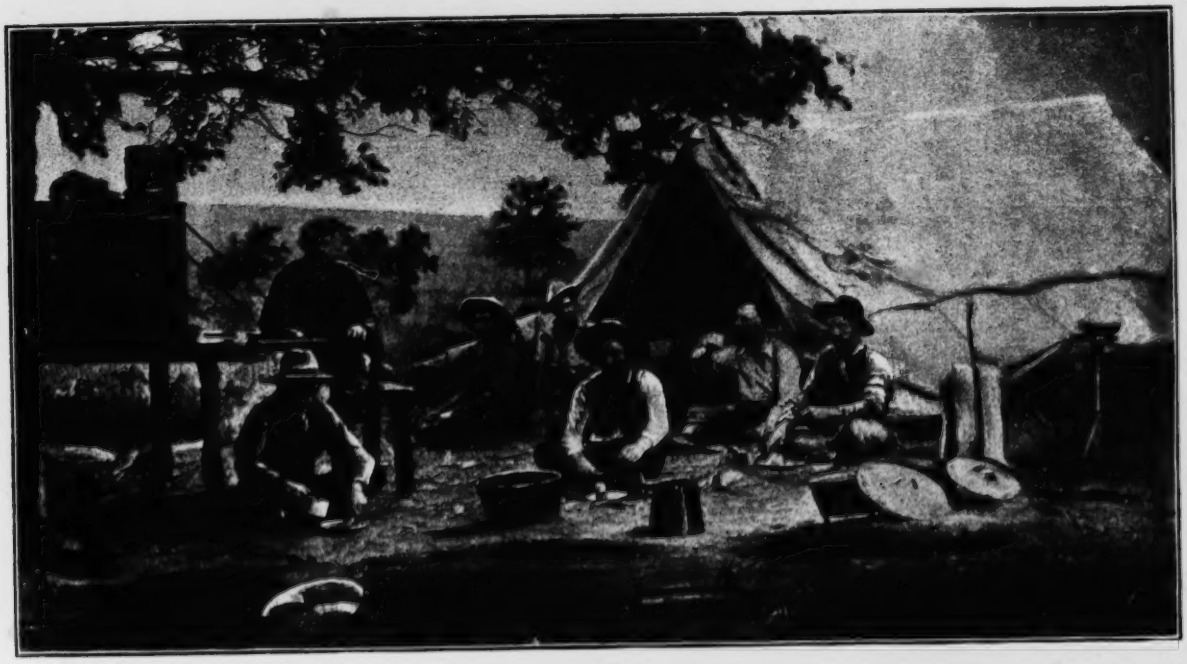
Mr. Wilson, it should be added, did not write as a Texan, his State and home both being in Kansas.

A great deal of information was unearthed by Mr. Colman and his agents with reference to States concerning which the cattleman is too apt to think very little, or, if he thinks at all, to underestimate their importance. Alabama, for instance, was carefully investigated by the report makers, and the fact that it offered many advantages to the stock growers was pointed out. "Of the lands within the border of the State a large proportion are uncultivated, and on these lands grow many varieties of grasses and forage plants capable of affording abundant sustenance to domesticated animals. Some of these grasses are scarcely surpassed by any others in value as food for cattle. Three large rivers and innumerable smaller streams furnish a copious supply of pure, clear water that never fails. The climate is mild and without those extremes of temperature that make stock growing often unpleasant and reduce the profits thereof in other regions. The domestic animals of Alabama have been quite generally exempt from epidemic diseases, and the outlay necessary for proper caring for cattle and other live stock in that State is very small; yet stock growing received comparatively little notice from owners of lands in Alabama until within a few years. Now, however, considerable interest is shown in the work of improving the quality of the live stock within the State. For that purpose a considerable number of purely-bred animals of great value have been taken to Alabama. Bulls of high breeding have been imported from the North to increase the value of the cattle, especial attention having been given to the work of improving the butter-making and milk-producing capacity of the stock. Jersey cattle have been imported in greater numbers than any other purely-bred animals. This work of improvement would, doubtless, have been carried on more rapidly had not the effects of the war retarded the movement, which is now going on at a constantly accelerating rate; and the cattle of this State will eventually rank as at least equal, if not superior, to those of any other State in the Union in value as butter producers, if not as beef producers."

Alabama has an abundance of grasses, the varieties totaling a hundred and fifty. About fifty of these are of considerable value for grazing purposes. It is claimed by the authority above quoted that an abundant supply of hay can be obtained in this State with less labor than can a large supply of any other product. The grasses that spring up spontaneously in wet places, and those which follow crops of small grain, afford a considerable quantity of hay of good quality; so good, indeed, that one correspondent declares that this hay is almost always better than that which is imported. "Several species of clover are found growing wild," he writes, "and furnish excellent pasturage all over the State; and the best varieties of red clover are very generally grown in the northern parts, constituting the staple forage crop of those regions."

In this State, so well favored for stock purposes, there were found in 1884 about two hundred and twenty-eight thousand milch cows and four hundred and eighty thousand working oxen and other cattle, showing a gain during the four years following the census of less than one per cent. A great increase in the number of working oxen was found, but it was also noted that while the number of working oxen had increased, the number of cattle had fallen off. In 1850, when the population of Alabama was seven hundred and seventy-one thousand, there were two hundred and twenty-seven thousand milch cows, and a total of seven hundred and twenty-eight thousand cattle. In 1860, when the population was nine hundred and sixty thousand, the number of cattle of all kinds reached seven hundred and seventy-three thousand. The effect of the war during the next ten years was clearly shown in the falling off in the number of cattle to less than half a million, and although there was a reaction from these low figures, those of 1860 had scarcely been reached at the time to which we are referring. Some cattle were found to be imported from Georgia for grazing, and the average cost per head was about $4.50 per year. Very little attempt had been made to feed cattle with corn, in spite of the immense quantities raised in the State, and cotton seed and cotton-seed meal were much more popular for the purpose.

Georgia, just after the great boom was over, was first in the number of oxen for the yoke, but far lower down in the list in the matter of range cattle. Two systems of stock raising were found to be used in that State, and the condition of affairs which prevails to-day was found to be very much the same ten years ago. In one system of feeding, stock are confined in enclosures and receive from their owners care, food and some shelter. This method is more generally adopted in the farming districts of upper and middle Georgia than in the southern part of the State. In the mountains, stock ranges at will over the hills, and in uncultivated valleys, as they do in the vast pine forests of lower Georgia. They find in wire grass or in Bermuda grass the greater part of their sustenance. The cost of keeping cattle in this manner is merely nominal, since owners of herds need buy little, if any, more land than will serve for a homestead on which to establish headquarters. Their stock roam at will over lands owned by non-residents, and their pasturage costs their owners almost absolutely nothing. Under conditions so favorable the profits of cattle raising would be considerable, even though the animals sold



MIDDAY MEAL.

at low figures. It will be seen that there is a resemblance between cattle growing in Georgia and the same business on the plains of the West. Cows are seldom, if ever, milked. Their calves are permitted to roam with their dams until the latter wean one crop, that another may take its place at the udder.

In Georgia, however, the stockman has an advantage in the fact that his cattle have ever at hand an abundant supply of water and are never exposed to severe storms. No "norther" can harm flocks or herds in the forests, nor among the sheltered valleys and timbered hills of the State. The forage of the open plains may be of better quality than the coarse native grasses of the Southeast, but it is usually found that the stock of Georgia is generally in as good condition as are those of the open plains where grass appears in early spring. In the Southeast cattle do not drift far from their native pastures, but remain content and undisturbed on the grounds to which they are accustomed. This saves their owners from losses of a kind which sometimes are heavy on the unfenced Western ranges.

For store stock to be fattened for beef Georgia depends now, as it did in 1885, almost entirely upon her own herds, but receives a few cattle from Alabama. Thus, those brought in are, as a rule, "scrubs," or unimproved native cattle. No very young stock is taken to Georgia from other States to be grazed and fattened for beef. Representatives of all the leading beef breeds are found in the State,

including Herefords taken in Clinch County and Galloways in Whitfield County. Georgia imports few, if any, calves, and but a very limited number of store cattle of any age; but calves dropped in that State are almost universally saved to grow to mature age. Even in the vicinity of larger towns there seems to be no such wholesale slaughtering of calves for veal as is seen in many parts of the Northern States. The greatest slaughter of calves occurs in the immediate vicinity of Atlanta, particulalry in De Kalb County, where fifty per cent, and in Fulton County, where thirty per cent, are thus used, and in Chatham County, in Southeastern Georgia, where fifty per cent are thus killed to supply Savannah. In many districts none are used for veal, and in no other counties than these named are more than twenty per cent used. The average cash value of calves slaughtered for veal ranged in 1885 from two to ten dollars in different parts of the State. Near Atlanta, they are worth, in early spring, from three to five dollars each, and near Savannah, about six dollars per head.

"For making beef, stock of all ages are used indiscriminately," says the report. "For grazing, of course, young animals are preferred, but cattle of three, four or more years are accepted. Most beeves are marketed when 'grass-fat,' whatever their age may be at the time. There seems to have been little or no effort to put stock generally on the market at an earlier age than that at which cattle were sold ten or fifteen years ago. This may be, in part, if not wholly, caused by the fact that the income from cattle is almost all profit, in the beef-grazing portions of the State particularly. It is well known that where little cost attends the production of domestic animals of any kind and the profits are large, their improvement advances slowly. Competition is a strong factor in progress in this as in all other branches of human industry, and there is practically scarcely any competition in beef growing in Georgia. When in marketable condition the beeves of this State weigh alive from eight hundred to fifteen hundred pounds. It may be that the greater weights mentioned are attained by working cattle that have been fattened, although there is little doubt that many of the animals at that weight are steers produced by using purely-bred bulls of a beef breed."

The great difficulty in the State, so far as the stock industry is concerned, has always been the matter of transportation. Thus, at the time to which we are referring, the cost per car load from Central Georgia to Chicago varied from two hundred and twenty dollars to two hundred and forty-five dollars, or about fifteen dollars per head. This left some margin for profit in heavy beasts, but not in others, and hence less attention was paid to the matter than would otherwise have been the case.

The figures and facts, collected as they were from over a large area, and by gentlemen who appeared to have been infused with the spirit which actuated Mr. Colman when at the head of the Agricultural Department, serve to correct, in a large measure, many of the erroneous impressions created by wild and enthusiastic statements as to the tremendous amount of business done during the boom years in cattle. They also serve as a summary of the condition of affairs at a time when the cattle trade was suspended, as it were, in the balance, and when many predicted an immediate falling off of profit and income, while others looked for an immense increase in both the extent of the trade and the money to be made out of it.

So far as Texas and the Southwest are particularly concerned, a great influence was exerted at this time by the enforced removal from the Indian Territory of immense herds of cattle, some of the stock being fat and ripe for marketing, but much of it being immature, and having to be placed on other grazing land, just when the area hitherto available for this purpose was being rapidly curtailed by settling up and fencing.

Cattle grazing in Oklahoma and the Cherokee Strip came to an end almost tragically. We have all read of how "Oklahoma Payne" came to grief again and again in his efforts to locate colonies in Oklahoma prior to its legal opening. It was always his idea, or at least his claim, that his efforts were checkmated by the cattlemen whom he charged in sensational terms with opposing the boom movement on the ground that if the country were settled up the cattle would be forced out. That he was absolutely wrong is now generally admitted. The cattlemen were allies rather than opponents of Payne and his daring followers. The loss involved to the latter by being driven out was trifling; the loss inflicted upon the former was enormous, running into the hundreds of thousands of dollars.

The Government action in this matter was scarcely consistent. Prior to the war slavery existed among the Cherokees, Choctaws, Creeks, Chickasaws and Seminoles. The Confederate States

occupied part of the Indian Territory at times, and recruited several regiments for the Confederate army. Owing to the sympathy of these tribes with the South, and their many overt acts to assist it, the Government held them to have forfeited their old treaty rights and compelled them to enter into new treaty obligations in 1866. By the terms of this treaty the Cherokees parted with a large body of land in the southeastern corner of Kansas, granted to them by the patent of 1838; assented to the rectification of the Kansas State line by pushing it southward about three miles, as previously stated; had their western boundary of absolute possession fixed at the ninety-sixth meridian, and agreed that all their lands lying west of ninety-six (which included the Cherokee Strip) might be taken by the United States to settle other tribes of friendly Indians upon, whenever needed for that purpose. The Government recognized the fact that all this land belonged in fee-simple to the Cherokees, by providing the machinery for its appraisal, and by subsequently taking and paying for all that part of it now within the boundaries of Kansas. In addition to this, when the Osages were induced to sell their Kansas lands and move to the Indian Territory, the Government took 1,400,000 acres of this Cherokee land lying west of the ninety-sixth meridian (as the treaty of 1866 authorized), and paid the Cherokees for it. Nor was this all. As if to forever settle this one point, the Government required the execution of a patent or deed thereof from the duly constituted authorities of the Cherokee Nation to the United States. So, again, in the cases of the Kaws, Poncas, Otes, Pawnees, Nez Perces and other friendly tribes, subsequently settled upon this Cherokee Strip, the Federal Government took it formally under the provisions of the treaty of 1866, and paid for the land so taken in each instance.

It will be seen that the United States has always recognized the absolute Cherokee ownership of this Strip. It is not an occupancy title, but the full fee. The treaty of 1866 merely gave to the Government the right to take such part of it as might be needed for the use of other friendly tribes whom it might be wished to locate there. Two other cases illustrate and prove the foregoing propositions. When the Government took this land for the use of friendly Indians, it did not comply with the treaty stipulations concerning its appraisement, as it was morally bound to do. The Cherokees objected to the price awarded them for it, and succeeded last year in securing an additional appropriation of three hundred thousand dollars on that account. Owing to most of the Strip lying so far from the seat of the Cherokee Government, and being entirely separated from them by the reservations cut off for the Osages and others, the Cherokees decided it was to their advantage to lease all the unoccupied portion of the Strip to the Cattle Association. The Government, although it subsequently tried to reflect somewhat upon the validity of this agreement, was perfectly aware of its existence, and, indeed, formally consented to its being signed. The rent was paid regularly every half year, and in the most open, business-like manner.

This being the case, the cattlemen were naturally indignant when, in the year 1884, the Government, as a result of the publicity given to the matter by the Payne agitation, commenced to treat them as trespassers, and to order them off the premises in anything but uncertain tones. In the year 1885 the matter became seriously aggravated, and was brought to a final and disastrous conclusion. General Sheridan, having been sent to the Territory for the purpose of investigating the causes of trouble, made a report in which he took the Indian's side of the case a good deal more than was expected. A delegation, including some of the best-known cattlemen interested in the Strip, waited on President Cleveland on August 4, 1885, and presented a memorial signed by the Cheyenne & Arrapahoe Cattle Co., Hunter & Evans, Standard Cattle Co., S. R. Moore, Seth Mabry, Newman Farr, S. M. Briggs, James Morrison, W. E. Mullalley, the Wood-Bagby Cattle Co., Underwood & Clark, E. Fenlon, Dickey Bros., the Wichita Cattle Co. and the Tower Cattle Co. The memorial they presented in behalf of the lessees of lands in the reservation covered the situation so accurately that it is best to reproduce it without alteration. It read:

"We do not doubt that it is the desire of the Government to deal equitably with this question in its relations to all parties, and those who have occupied the Territory by leases for two and one-half years, by the permission and authority of the Government, are entitled to a resonable period for the removal of their property. The leases, which were in every case made with the knowledge of the then Secretary of the Interior, were submitted to him and received from him every sanction, except the formal and technical affix of his signature and seal.

"Under these circumstances, the lessees of the lands in question have placed upon them a large number of cattle, estimated at not less than two hundred and fifty thousand. In addition to the value of the cattle, we call your attention to the further investment in range improvements, fencing, corrals and all the belongings of so extensive a business. The aggregate of value affected by the executive order may, therefore, be fairly stated roundly at over seven million dollars.

"The area of land affected by the proposed action is between three million eight hundred thousand and three million nine hundred thousand acres. This acreage being stocked to its grazing capacity by the number of animals stated, an equal amount of land is required for the subsistence of the animals elsewhere; and among the most serious of the questions suddenly forced upon us is: Where can this amount of land be found, all the adjacent territory being fully stocked? It cannot be found by driving the cattle back to Texas, whence many of them came, and the remote ranges of Wyoming, Montana and Dakota can alone provide for them.

"It is absolutely impossible to secure and locate lands in these Territories within the time allowed, and were it practicable to find lands supplied with water in these Territories not already occupied, it is impossible to gather the cattle scattered upon their present ranges, and move them north at this season of the year. Cattle cannot be driven in herds exceeding three thousand, and it requires twelve men and sixty horses to handle such a herd. It will, therefore, be seen that to move the entire number of cattle affected by the executive order, an aggregate force of one thousand men and five thousand horses must immediately be collected. This is utterly impossible at this season of the year, when range work is at its greatest activity and experienced herdmen fully employed. We have but few men at the present time, having our ranges enclosed by fence and not requiring herders.

"The drive from the ranges now occupied, to new ones in the Northern Territories, can not be made in less than from three to four months. In moving the cattle from their present locations subsistence must be found along the whole drive they traverse, and it is well known by cattlemen that at this advanced season of the year the summer heat has seriously impaired the nutritious qualities of the grasses. The result must necessarily be that many of the cattle would perish on the line of march, and those finally reaching the Northern ranges would be in such an enfeebled condition as to be unable to withstand the rigors of the Northern winters, to which they are unaccustomed. We desire to emphasize this statement by the further fact that the streams and water-holes along the trails are all lower at this season than at any other, and many of them are entirely dry. The distance required to be traveled by the cattle to these new ranges at the North is from eight to twelve hundred miles. The universal custom of those engaged in the business of driving cattle from the Indian Territory and Texas ranges northward is to start them in no case later than April. Experience has shown that cattle put upon the Northern ranges later than August 15 are so reduced by the long drives that they are unable to gain strength to endure the early winter storms.

"A large proportion of the cattle affected by this order have been brought into the Indian Territory this year from Texas. The quarantine laws of Kansas, Colorado and New Mexico rigidly forbid the admission of such cattle into, or their transit across, their territory prior to December 1. We respectfully refer you to the recent proclamation of the Governor of Kansas in this connection.

"The above are but a portion of the difficulties which confront us. There are other features of the subject which commend themselves to executive consideration, among which is the fact that rentals for all these lands have been paid to the 1st of November of the present year. No amount of diligence will enable us to gather up all the cattle during the time allowed, and the result must be that the uncollected portion will be left on the range unprotected by their owners, and subject to the depredation of the Indians.

"In conclusion, we respectfully state that this memorial is directed not against the policy which has been adopted, but against the time which has been allowed to conform thereto. We only solicit that measure of protection to our property which is accorded to other established interests. The enforcement of the present order can only result in great injury to ourselves, as well as to others with whom we have business relations. We, therefore, respectfully ask for such time to remove our cattle as the above facts show to be indispensable."

Col. Denman followed up the memorial with a very earnest speech, in which he pointed out that the cattlemen understood their business better than any one else could possibly do so. It had been stated that the President intended to insist upon all the cattle being removed within forty days, and he pointed out that it would be impossible to secure the requisite number of men and horses during that period to commence the work. He strongly urged that the cattlemen be allowed until the following spring to remove their cattle. President Cleveland's reply was exceedingly discouraging. He stated that it was impossible to delay the matter until the following spring. He urged the co-operation of the cattlemen, and told them that no modification could be hoped for in the matter.

The delegation turned back West in a very unsatisfactory frame of mind. Telegrams engaging cowboys were dispatched in every direction, and the men determined to get the cattle out as rapidly as possible. Fully two hundred and fifty thousand cattle were involved in the order, and at the time there were fully one and one-half million cattle in the entire Indian Territory, including the Cherokee Strip, The announcement was made that all leases would be canceled right away, and within a week a proclamation by the President confirmed the rumor, and showed that, important as was the industry at stake, no consideration whatever was to be shown to it.

It was not until six or seven years later that the Cherokee Strip was finally cleared of cattle, but the death-knell to the cattle interests, so far as the Indian Territory was concerned, was really sounded in July and August, 1885. It is significant that very little recrimination or hard feeling resulted from the action of the President and his Cabinet. It was generally felt that the Government had been misinformed as to facts, and had looked upon the matter in a somewhat narrow-minded way. But, colossal as the task of getting out and abandoning the blue grass of the Territory seemed, it was undertaken and completed. The loss to the country, as well as to the cattlemen, as a result, has been enormous, a fact which has since been recognized, though the injustice done was not, and, indeed, could not, be rectified.

COMPANY "D," TEXAS RANGERS.

CHAPTER IX.

The Collapse in Prices, and the Causes Which Produced It.

AS WE have already remarked more than once, the history of the cattle industry of Texas and the Southwest, and, indeed, of the United States, is a history made up of cycles. We read in the Bible of Pharaoh's seven years of plenty followed by seven years of famine. Thanks to the invaluable advice given to the Egyptian monarch by a man—who may fairly be described as having been born and raised on a range, and to have been in his boyhood, even more picturesquely attired than the most excitable and enthusiastic cowboy of to-day—precautions were taken during the years of plenty, and when the term represented by the lean kine commenced, there was in store a large supply of food and feed for man and beast, not only for Egypt, but for other adjoining countries.

In the cattle trade the mysterious figure of the seven, with all its mythological inference, has not been so conspicuous. Sometimes the period of plenty has lasted less than a year, and the period of depression which followed has been equally short-lived. Sometimes it has been longer. But, as we have seen in earlier chapters, an absolute disregard of the laws of supply and demand has almost invariably broken down prosperity whenever it made itself apparent, and too often very little provision was made for the inevitable rainy day. It is now the duty of the historian to speak of the decline of the cattle industry and period of inflation of the early eighties. The writer of these chapters, having investigated the subject from an impartial standpoint, and having absolutely no interest in or partiality toward any one of the various theories adduced, is in a position to give both sides of every story.

While there is a great deal of controversy, and there will always be, as to who is to blame for the knifing of profits of recent years, and particularly between the years 1885 and 1890, there are some arguments of weight which are admitted by all. The first of these is that the business of cattle growing, or rather of cattle selling, was overdone. In this connection attempts have been made, as already noted, to make the mammoth Convention of 1884 a scape-goat for the trouble, and to blame it as having been the cause of the immense increase in the number of cattle shipped to market in advance of demand and requirements.

There really seems little justification for a charge of this kind. It was perfectly well known before the Convention was held that the cattle-raising industry was in an abnormally prosperous condition, and that as prices had nearly doubled, it was obvious that men who had made money at the old figures must have nearly coined it at the new. The only point one can see in the charge brought against the mammoth Convention is that it attracted press notices from all parts of the country, as well as in all the leading cities of the Old World, and hence may have contributed in a measure toward the excessive introduction of capital and amateurs into the business, and to the raising and marketing of all kind of cattle regardless of age, weight, grade, supply and demand.

No reflection can possibly be cast upon the officers of that magnificent gathering of cattlemen, or of the association which it organized and started. For a time that association bid fair to carry out work of a most important character, and we believe that the good it accomplished far more than outbalances any possible injury that may have resulted from the publicity it caused and the attention it attracted. It should also be borne in mind that the association which was the outgrowth of the first National Convention of Cattlemen was not by any means the only national society of its kind. The Convention of Stockmen at Chicago had started another association, and for a time the woods were full of national and international organizations which were designed to protect the interests of members, and to uplift and uphold the cattle trade in its various phases, and especially those which appeared most important to the individual organizers and promoters.

There was no limit to the scope or location of these associations or to the conventions they called. The first National Convention of Cattlemen at St. Louis was followed by a second convention of

similar name, while the Chicago stockmen held three conventions, one after the other, at dates calculated to almost clash with those of the St. Louis organization. Then, while these two associations, with headquarters at the two Western cities, which for a quarter of a century have been antagonistic to each other in many respects, were practically opposing each other, although nominally working in harmony, the International Range Association was formed, and a grand Convention held in Denver, Colo., in January, 1886, or within two months of the second St. Louis and the third Chicago Conventions. All over the country, State and local associations held meetings, at which they endorsed first one and then the other of these associations and conventions, and the man who tried to follow the transactions of the various bodies and keep himself posted on the policy outlined, adopted or condemned, found his head swimming, and had to ask himself more than once, in common with the defeated politician: "Where am I at?"

One by one the national associations gave up the ghost without an effort. Most of them collapsed by mutual consent. In other words, when the organizations were found to have outlived their usefulness, to have lost the enthusiastic support of their members and to have failed in the objects for which they were specially organized, the officers were wise enough in their day and generation to quit calling meetings, and to allow the societies to lapse on general principles.

Just how many of these associations survive to-day we are unable to state. Out of more than fifty letters of inquiry sent to the last-known officers of the associations scarcely any have produced definite replies, and many cattlemen have stated that the Texas associations, described more fully in the last chapter of this work, are the only ones with any great influence to-day. This may be incorrect, but, if it is, the fault for the existence of the impression rests with those who have made no effort to correct it.

That the prosperity of the cattle trade has declined in consequence of the collapse of so many associations is by no means assured; but it is certain that the two events were coincident, no matter which was the cause and which the effect. The magnificent prices, to which we have alluded as making glad the heart of the cattleman in the early eighties, were succeeded by prices which, while, in some instances, they left a nominal margin of profit, took away the gold-mine appearance and reputation of the trade, and made the earning of a livelihood much more common than the amassing of a fortune. What may be termed the non-controversial cause of the collapse of the boom while it was at its height, was very similar to the causes which led to the collapse of less remarkable periods of prosperity ten and fifteen years previously. In other words, undue haste to become rich and to find the road to wealth led to the killing of the goose to secure the golden egg, which it was apparently willing to lay at respectable intervals.

The expression "Cattle King" or "Cattle Baron" is not a popular one on the ranch or at the stock yard. The term grew into existence, or rather prominence, at the time of which we are speaking, or the first few years of the eighties. Newspapers on the lookout for sensational items printed accounts of the phenomenal wealth and prosperity of the so-called cattle barons and cattle kings, and any one from Texas, Colorado, New Mexico, Arizona or Wyoming, who happened to be located at a hotel in an Eastern town, by a reporter on the lookout for a news item was generally described as "that well-known cattle king, Mr. ——," no matter whether the gentleman was a cowboy, a country postmaster, or a small storekeeper. The name got to be used so freely, and with such little regard to fact or reason, that it soon became a by-word on the Southwestern, and more particularly the Western, prairie, and when a man was asked to purchase something at a figure which appeared somewhat high or beyond his reach, he would often reply, with ill-concealed sarcasm, "I'm no cattle king."

We have yet to find a cattleman to the manner born and thoroughly experienced in all the happenings, dangers and difficulties of ranch life, who calls himself a cattle king or cattle baron, or who tolerates the term as applied to himself. We have met several so-called cattle kings, both in Eastern cities of America and in cities of the Old World. On their way out to take possession of their kingdoms, these self-styled kings or barons were so overstocked with enthusiasm, that if there had been a market for such a commodity, it would have been overstocked and the demand would have been supplied a thousand times over every day. On paper, their fortunes were ready-made or doubled or

trebled, as the case might be. They expressed themselves on every subject with that freedom so characteristic of a man who knows nothing of which he is talking.

Hoyt, in his play, "A Texas Steer," lampoons the Texan a little too severely, although, at the same time, he shows up many noble characteristics of the native of the Lone Star State. He tells, with his delightful sarcasm and humor, of a certain section of Texas which needed nothing but a little water and a little society to make it excessively desirable, but which was at the time absolutely worthless, and which, being located in the meanest part of the Staked Plains, was not inaptly likened by the newly-elected Congressman to that warm, but undesirable, country to which the bad man who dies in his boots is supposed to go. Attempts, such as Mr. Hoyt not improperly holds up to ridicule, were made again and again at this time to occupy barren tracts of land for alleged cattle raising purposes. Many millions were lost, not in cattle raising, but in fake schemes got up by professional speculators, and by men who had purchased worthless tracts of land with a view to selling them to misguided individuals, who had caught the Texas fever and were determined to stand in with the crowd which was supposed to be making thousands of dollars every hour by breeding and raising cattle in that much-talked-of, and at this time exceedingly popular, State.

It is not to be wondered at, under these conditions, there was a wild rush into the range country on the part of people inexperienced in the cattle business, but anxious to participate in the profits said to be so easily made by cattle raising there. A London (England) newspaper, published in the year 1883, explained, with great care and apparent accuracy, how a yearling could be purchased in Texas for three or four dollars, fattened at the expense of another dollar, and then sold at about sixty or seventy dollars per head net. In order to demonstrate the truth of these remarkable figures, the London journal pointed out that so rich were the pastures of Texas that an ordinary steer of three years weighed twelve hundred or fifteen hundred pounds, and that this meant a thousand pounds of dead meat. Beef, the paper proceeded to point out with mighty eloquence, sold at as high as thirty cents and thirty-five cents a pound in London, and even making allowance for cost of transportation, it was easy to understand that the figures it had quoted as to the net prices per head were under, rather than over, the mark. The article concluded with the interesting statement that the figures had been furnished by a cattle king—whose name was carefully withheld—who, himself, had realized an enormous fortune by raising cattle and disposing of them in the manner described.

Idiotic as these figures and arguments were, they were quite common in what may be described as tenderfoot sections; and that they were really believed and relied upon, is evident from the tremendous rush of inexperienced men into the West and Southwest, all determined to obtain their share of the profits to be realized from buying yearlings at half or a third current prices, raising them at a third or fourth the actual cost, and then selling them at figures about double the ordinary quotations for two and three year olds raised in the manner described.

In the opinion of the most conservative members of the trade, these were the men who broke down the prosperity of the cattle industry of the West and Southwest.

They brought with them ridiculous ideas as to the cattle business. Political economists and theorists generally have, for many years, been explaining that the agricultural depression in the Old World is not so much the result of a falling off in demand, of increased cost of production, of foreign competition, or even of lower markets, as of the change in the mode of living of the farmer himself. A generation or two ago, these writers have pointed out, again and again, the European farmer was himself a worker, taking his turn at the plow or sickle with his men, and getting every cent that was possible out of his small holding. In more recent years the tenant farmer has become more ambitious for himself and his family. He expects to take part in sports and recreation hitherto restricted to the landlord and the squire. His daughters, instead of attending the village schools, and commencing to help in the kitchen and dairy, almost as soon as they could read and write are sent to boarding and finishing schools, and dressed without regard to expense. The sons are taught from infancy to regard farming as an unfortunate occupation, and are, in consequence, only too glad to go to college and study for some already-overstocked profession.

As a matter of course, the little old farm house, which had answered all requirements for the preceding generation, is regarded as entirely too shabby and old-fashioned for the highly educated

young people, and money is, accordingly, borrowed for the erection of either additions or of new houses. The old horse, which had carried the family to the nearest town on market days and to church on Sundays, has to be replaced with a more expensive animal, and a first-class carriage is substituted for the spring van which formerly did duty both for business and pleasure. In a variety of ways, the agricultural theorists explain, the expenditure of the small farmer in Europe has about trebled in a generation. At the same time, or during the same period, profits have been curtailed and, as a result, debts accumulated, and an era of discontent pervades the agricultural regions of England and Europe.

We have introduced this fragment of Old World history and philosophy because it is strictly pertinent to the subject we are now discussing. The young men with swelled heads and limited intelligence who crossed the Atlantic twelve or thirteen years ago in order to locate on ranches, make fortunes in a few months, and return home to live lives of luxury and ease from that time forth, represented the extravagant agricultural idea to perfection. The Texas cattleman seldom goes in for extravagance or luxury on the ranch, no matter how wealthy he may be. Solid comfort he naturally aspires to, but he has not yet discovered how to combine pleasure with business every day, and how to enjoy all city luxuries on the broad and open prairie.

But the young men to whom we are referring thought that it was the ignorance, rather than the good sense, of the cattlemen which prevented them from launching out into extravagance and having a royal good time. Many of the new-comers were descended from leading families of the Old World, and these, in particular, introduced the aristocratic ideas of farming into Texas, Arizona, Wyoming and other cattle countries. Dressed in costly velvets, with buckskin leggings and patent-leather boots, these exquisites considered it beneath them to count the cost too closely. They made a certain class of trade good for a time by buying whatever suited their fancy at the moment, and paying almost any price demanded, on the theory that it was beneath them to bargain or haggle. Again and again they neglected their business for the purpose of engaging in hunts and exploring expeditions. Some of them kept expensive packs of hounds, stables with blood horses, and gave receptions and parties at frequent intervals. For actual life on the prairie and the work connected with legitimate cattle raising they had a supreme contempt and dislike, which they took every opportunity of expressing. Sometimes they were so aggravating in their remarks as to provoke hot retorts, and occasionally unpleasantness resulted which was always attributed to the ill-breeding and bad manners of the original inhabitants.

These men committed acts of folly by the thousand. They purchased more ground, in many instances, than they could possibly use; and the amount of fencing they had done, while it must have been very gratifying to barbed-wire dealers, was a source of immense inconvenience to smaller and more sensible cattlemen, who were not seeking the entire earth, but were satisfied with fair profits and a good living. Their extravagance was so wanton that it was merely a matter of time how soon their capital would be exhausted, or how soon supplies would be cut off from the old country.

Ruin stared the wiseacres in the face from the outset. In some instances it was delayed a short time by more or less favorable circumstances which came to the rescue of the exquisites. But the day of reckoning was seldom long postponed, and when it came disaster followed. Few people felt any great sympathy for the invaders, whose regard for the feelings of others had generally been conspicuously small. But the trade generally suffered almost beyond computation from the sudden throwing upon the market of cattle of all ages and conditions, which, in many cases, were consigned without the least forethought or pre-arrangement, glutting the market and cutting prices all to pieces.

It is the opinion of many well-qualified judges that the high prices, to which we have referred several times, could have been very nearly maintained but for the fact of such an immense quantity of unsuitable stock being forced on the market. Be that as it may, it is certain that the self-styled cattle king or cattle baron, with his extravagant notions and foolish ideas, expedited disaster and brought about a whirlwind which, while it annihilated him, seriously injured the men he affected to despise, and who he had tried in vain to educate up to his own erratic and quixotic ideas.

Mr. James H. Campbell, a careful student of the cattle business, expresses himself in a very conservative manner on this subject. Without actually endorsing every one of his arguments, we repro-

duce them as a most important contribution to a controversy which has been in progress for eight or ten years, and which has formed the basis of a most important Congressional inquiry. "Various theories," says Mr. Campbell, "have been advanced, among them that the dressed-beef interest and purchasers of cattle had combined to break prices, and that a few of the larger packers were responsible, in a measure, for the shrinkage in values that has been going on the last few years. But the writer desires to give a few plain, practical reasons for the fluctuations in the value of cattle for the past decade or so, other than those suggested above, and hopes to make himself understood, as he believes his reasons are based on actualities rather than theories. So many disappointments have been suffered, so many fortunes made and lost, that the subject has become a very serious one, and worthy of earnest and honest thought. Experience is a hard schoolmaster, but a practical one, and it may be that our review may prove valuable to the general trade.

"In the years preceding the advent of the great industry called the dressed-beef business, or from the close of the war in 1865 to the year 1876, the prices of cattle were governed entirely by the supply and demand.* We had practically none but a home market. Raisers and producers took their cattle to market and met buyers from the East, who purchased their stock on its merits; always, of course, basing their values upon the supply, present and prospective, as well as the consumptive requirements of the people. But between the years 1876 and 1880 a great revolution in the cattle industry commenced in the United States. Some enterprising Eastern Yankees began slaughtering cattle in Western markets, and shipping only the carcasses to the East and to the seaboard, instead of following the old system of shipping only live stock. It was also discovered that improvements in shipping and carriage facilities were such that either live or dressed beef could be sent across the Atlantic Ocean, to various Old World markets, at a profit to the shipper, thus opening up a new field for our product.

"It required but a very few months for the latter feature to develop into a prominent factor in the cattle trade. First, live cattle were exported, then dressed; then both live and dressed beef, meeting with ready sale, developed another interest—the canned-beef industry, by which millions of pounds of beef are annually shipped to almost every point in the civilized world. The opening up of this export business in the ways mentioned developed an enormous demand for fat steers suitable for the export trade, and really worked a revolution in the cattle business, especially as the trade with other countries was quite remunerative. Naturally enough, the strong demand for good cattle stimulated production, as well as enhanced prices of the raw material, and this continued until we over-produced.

"From 1878 to 1882 the revolution was rapid. Capitalists saw a good opening for investment, and for 1878–79 there were large purchases of breeders made all through the great corn belt, and these were shipped to the far Western States and Territories, where millions of acres of land were available, almost without cost, for feeding purposes. The outcome of this was the development of the ranch idea. Bulls, heifers and cows were actively sought for breeding purposes, and then began an era of production rarely if ever equaled. The 'cowboy' became an actuality instead of an idealist. Everybody that could was anxious to become interested in a ranch. Texas, the Indian Territory, Wyoming, Arizona, New Mexico, Colorado, Nebraska, Dakota and Montana all vied with each other for supremacy in the cattle-producing and cattle-raising industry. The short corn crop of 1881 and the favorable winter of 1881–82, which made feeding on the wild Western lands available, materially aided these Western producers, so that in the spring of 1882 cattle all through the Western States and Territories were in good condition. Native cattle were not plenty, owing largely to the drain of the two or three years preceding of breeders by the Western ranchmen, so that the spring of 1882 witnessed an urgent demand, at prices rarely before reached in the history of the trade—viz., nine cents per pound gross. When it is remembered that cattle shrink from fifty to fifty-five per cent in killing, it will be readily seen that the above price (nine cents) really meant seventeen to eighteen cents for the real meat of the animal. This does not mean for the choice cuts, but for everything, the soup-bone as well as the porter-house steak.

"Now, let us see what the consequence of these high prices were. We have shown what caused the enhanced figures up to and including the year 1882, which, it may be remarked, was a phenomenal

*Self-evident as this assertion of Mr. Campbell appears to be, it is not altogether correct, as the figures already published show. Prices have sometimes fallen with a shortage in supply, and risen when shipments were very heavy.

year in the history of the cattle trade. A great many men and much capital were brought into the business prior to 1882. But the high prices of this (1882) year—which enabled ranchmen and feeders to net handsome profits—developed still greater investment inquiry on the part of capitalists. There was, and had been for some time, not only a liberal, but a rapidly growing, demand for beef cattle, and not only American, but European capital as well, anxiously sought investment in cattle raising. So rapid, indeed, was the growth of this business, and so large the profits, that the pioneer cattle raisers and producers who had been content to go out on the frontier and risk their lives as well as their capital, with only a prospect of moderate returns, and most of them possessed comparatively small herds, suddenly awoke in the spring of 1882 to the fact that their herds were veritable gold mines. Cows and calves had advanced in a comparatively short space of time from eight to ten dollars a head to thirty and thirty-five dollars per head, while youngsters, yearlings and two-year-olds had advanced almost three hundred per cent in three years."

Mr. Campbell proceeds to show that, stimulated by the high prices prevailing, the Mississippi Valley and the great corn belt of the West was virtually "skimmed" of cows and heifers by speculators and ranchmen who wanted them for breeding purposes. A very large number of bulls that, under ordinary circumstances, would have been sent to market as beef steers, were preserved and shipped to these Western ranges. All these features were not without effect on our supply of native cattle. In point of fact, as noted above, a vast territory, reaching from the British possessions on the north to the Gulf of Mexico on the south and the Pacific Ocean on the west—a territory which had been previously largely inhabited by no other humans than Indians, and by buffalo and other wild animals, had almost, as if by magic, been transformed into great breeding and grazing grounds. And what was the result of this? Simply that the business was overdone, and the end was what invariably follows overproduction.

Not that the result was developed in a month or a year, for it was not. Had it not been, however, for the opening up of new markets for the product—had not exporters of cattle utilized refrigerators on cars and on vessels, and had not packers discovered the utility of packing beef in cans so that it could be shipped to almost any clime, then it is more than likely the rebound would have set in before it did.

The fact is—and it must be apparent to every thoughtful man—that this overproduction exerted a deleterious effect on the stock itself. Prior to this great influx of breeders, the boundless prairies were as free as air. Cattle roamed wherever they chose. But wealthy corporations purchased or leased large areas, introduced barb-wire fences, and the roaming area was diminished. The result of this was a largely reduced grazing area, and the feed was eaten clear to the ground, so that now, instead of raising such cattle as we did ten years ago, we are producing half-starved, ill-shaped beasts, that do not carry flesh or make weights as beef steers, even when fully matured. Is it any wonder, when all the above facts are considered—overproduction and inferior quality especially—that the cattle trade is not in a healthy or prosperous condition?

Mr. William Kuykendall, in another of his letters to the "Texas Stockman and Farmer," argues in a very similar and equally forcible strain. It is not a matter for surprise, he points out, that during a period of universal excitement, caused by abnormally high prices and an apparently insatiable demand, the ranchmen should have disregarded the law of conservatism, and invested to a greater extent in both cattle and lands than prudence would have dictated. The result of this mistaken policy has made many land-poor. Had the inflated price for cattle then ruling continued, the end might have justified the means, but in this boom, as in all others, history was destined to repeat itself. At an unprecedented rate herds were multiplying throughout the country. Notwithstanding the increasing demand, both at home and abroad, for our meat products, the demand was not keeping pace with the rapid increase of supply. The inevitable crisis came in 1883, when a sharp decline in the market for all classes of cattle was noted. The markets failing to rally under the increased burdens, serious disaster to the country followed.

Conditions had arisen that brought the producers into contact with problems not hitherto encountered; a new factor, the cost of production, for the first time became an important part of the trade question. Heretofore, under the "free grass" regime, the cost of production was merely

nominal, but under the new system the investment in land and fences had greatly enhanced the cost. Nor was this the only new condition which had arisen to aggravate the situation. The rapid settlement of the country closed the "trails," the great thoroughfares over which hundreds of thousands of cattle were yearly driven at a cheap rate to the maturing ranges of the West.

Besides these, evils of greater or less importance were beginning to exercise their influence. The pastures were becoming overstocked, obligations contracted in the purchase of lands and stock were beginning to mature, and the Western States were enacting quarantine laws to protect their herds against the introduction of splenic, or so-called Texas fever. In the face of these discouraging circumstances a feeling of panic pervaded the business, and the disposition to get out of it was only equaled by the desire to get into it a few years before. Many disposed of their interests at great sacrifice and abandoned the business. The extensive packeries at Chicago, St. Louis and Kansas City, which, by turn, have been blessed and cursed by ranchmen, were taxed to their utmost facilities to utilize the vast numbers of inferior grades of cattle thrown upon these great central markets.

"Here, it may be remarked, parenthetically," Mr. Kuykendall concludes, "that the salutary influence exerted over our cattle trade by these great modern industries has been incalculable; for, be it remembered, that largely the greater portion of our Texas beef has for years past found the only available market at these establishments, and, in the absence of the demand thus created, a market for the poorer grades of cattle could not have been found elsewhere. Through these channels, during the past ten years, a vast amount of the product of our herds has reached foreign markets, which otherwise must necessarily have been thrown upon our domestic markets, already greatly depressed, thereby forcing a further decline. In this connection it should be borne in mind that we produce on our Texas ranges no beef suitable for the export trade in live cattle, and it is only through the dressed meat or canned goods trade that we are enabled to reach foreign consumers."

The evidence taken by the select Committee of the United States Senate on the transportation and sale of meat products, during the years 1888 and 1889, contains the opinions of a large number of well-known cattlemen concerning the depression in the trade, which is the subject matter of this chapter. Of the report prepared by the Committee as the result of its inquiry we shall speak later, but, at the present time, our object is to place arguments as well as conclusions before the interested public. It needs not a philosopher to show that the best way to emerge from a period of depression is to inquire closely and carefully into the causes and circumstances which produced that depression. Hence, too much space can scarcely be given to a compilation of opinions as to the cause of the rapid fall of prices of range and other cattle after the boom.

The select Committee consisted of Senator Vest of Missouri, Senator Plumb of Kansas, Senator Manderson of Nebraska, Senator Coke of Texas, and Senator Cullom of Illinois, the latter being relieved at the close of the Fiftieth Congress by Senator Farwell, of the same State. The inquiry was held as the result of the action of the United States Senate in May, 1888, when it was resolved that a special Committee of five Senators should be appointed by the President of the Senate, whose duty it should be "to examine fully all questions touching the meat product of the United States; and, especially, as to the transportation of beef and beef cattle, and the sale of the same in the cattle markets, stock yards and cities; and whether there exists or has existed any combination of any kind, either on the part of the Trunk Line Association or the Central Traffic Association, or other agencies of transportation, or on the part of those engaged in buying or shipping meat products, by reason of which the prices of beef and beef cattle have been so controlled or affected as to diminish the price paid the producer, without lessening the cost of meat to the consumer. That said Committee may hold its sessions during the recess of the Senate at such times and places as it may determine, and shall have power to send for persons and papers, and also to employ a stenographer and a sergeant-at-arms; all necessary expenses of said Committee to be paid out of the contingent fund of the Senate; and said Committee shall make report to the Senate at its next session by bill or otherwise."

This resolution was passed at the request of Senator Vest, who, in his speech, advanced a number of theories as to the causes of the depression, which he proved by an immense number of figures and statistics. Most of these figures, while exceedingly interesting, were almost overwhelming in their extent, but the following table of average weights, prices, charges and net values of cattle, from States and Territories named at Chicago in 1887, is of sufficient importance to justify its reproduction in full:

MISSOURI.

	Per Head.
Assuming same weights and divisions as Iowa. Average weight, 1,200 to 1,400, estimated to comprise one-sixth of the shipments.	
Average price, $4 40	$57 20
Less charges	3 35
Net value	$53 85
Average weight, 1,000 to 1,100, estimated to comprise two-thirds of the shipments.	
Average price, $4 00	$42 00
Less charges	3 35
Net value	$38 65
Average weight, 700 to 900, estimated to comprise one-sixth of the shipments.	
Average price, $2 00	$16 00
Less charges	3 35
Net value	$12 65
General average, weight and price	$40 20

Charges—

Railroad freight	$2 50
Yard charges	25
Feed charges	10
Commission	50
Total charges	$3 35

ILLINOIS.

	Per Head.
Average weight, 1,300 to 1,500, estimated to comprise one-sixth of the shipments to Chicago.	
Average price, $4 60	$64 40
Less charges	2 32
Net value	$62 08
Average weight, 1,100 to 1,200, estimated to comprise two-thirds of the shipments.	
Average price, $4 00	$46 00
Less charges	2 32
Net value	$43 68
Average weight, 700 to 900, estimated to comprise one-sixth of the shipments.	
Average price, $2 00	$16 00
Less charges	2 32
Net value	$13 68
Average of all combined	$44 06⅔

Charges—

Railroad freight	$1 50
Yard charges	25
Feed charges	07½
Commission	50
Total charges	$2 32½

COLORADO.

	Per Head.
Weight at Chicago, pounds	1,050
Price per 100 pounds in Chicago	$ 2 65
Gross value, 1,050 at $2 65	27 82
CHARGES—	
Railroad freight	$4 50
Yard charges	25
Feed charges	50
Commission	35
	5 60
Net value	$22 22

WYOMING.

Weight at Chicago, pounds	1,100
Price per 100 pounds at Chicago	$ 2 75
Gross value, 1,100 at $2 75	30 25
CHARGES—	
Railroad freight	$4 50

Dealing with the relative importance of the three great Western cattle markets, and the influences which had been, and were still, at work in connection with these, Mr. Vest said: "I dislike, in the discussion of a great question like this—for it is a great question—to say anything that has the least appearance of local interest, but I am compelled to allude to the fact that the largest city in the State, the City of St. Louis, which ought, geographically, to have been at least the equal of Chicago in the sale of and purchase and shipment of cattle, is to-day far behind Chicago, and so inferior to it in this matter of purchasing and shipping cattle that a comparison is hardly worthy of being instituted between the two cities. St. Louis is the great city of the Mississippi Valley, and geographically it ought to be the shipping point for Texas, the Indian Territory, and the large ranges of the Southwest, but for some reason, which I now propose to investigate, the cattle interest of St. Louis has been stricken down.

"The city in which I live, Kansas City, is to-day in close alliance, so far as the cattle interest is concerned, with Chicago; but Chicago is the heart, blood, brain, liver, of the cattle trade throughout this country and throughout the world. As great as that city is, and no one admires its prosperity, enterprise and activity more than myself, it has not been natural reasons that have brought this about. It has been a combination, a selfish combination of interests, as a matter of trade and commerce, which, now that it has affected the price of cattle to the consumer, becomes a matter of the greatest importance to every man who thinks it is his duty, as an American citizen or legislator, to investigate the present condition of affairs. We know that to-day five firms in the City of Chicago control the price of beef throughout the whole United States. There is not a butcher in the City of Washington who is not subservient to that combination in Chicago; not one from Boston to Charleston, but who feels the effect of this combination. The great railroads of the country running into Chicago are in the interest of this combination. They are in sympathy with these five firms, and to-day any bunch of cattle that goes from any portion of the West, and all go to Chicago, the moment they are shipped these gentlemen at Chicago are apprised of the quality, the number, when they will arrive, and are prepared with a price. The prices are fixed every week. I said on a former occasion every day; but they are fixed practically so that every morning the price is agreed upon between the purchasers, and the shippers who bring cattle to that market must take those prices, or let the cattle die, or ship them back to the place from which they were brought."

Senator Cullom, speaking to the resolution, entered what was practically a plea of guilty on the part of the combine. "This is not the result," he said, "of a year or two's operations; it is the result of the operations of certain forces which have been going on for many years. The control of the live stock business of the United States is centered in the hands of a few men. Of course, this grows by what it feeds on. As these men have accumulated wealth, they have been able to go more completely into the markets of the entire world, and, by combinations and by operations with which we are familiar enough, to break down the small dealers, and therefore to break down, from to time, every single shadow of competition.

"They not only combine, as has been said here, in fixing the price of cattle that they buy in the market, but they combine to fix the price at which the cattle shall be sold in the State in which they put them on the market; and they do that by parceling out the territory among themselves, one great

dealer taking one section of the country, another another, and so on, upon an agreement that there shall be no competition by any of his fellows within the territory thus allotted to him. Thus it is, while they buy at the lowest price that is ruinous to the cattle producer, they sell at a high price to the cattle consumer; and so it has happened that they have actually put in their own pockets every single penny of the profit on every steer sold in Chicago during the past five years or more, and as cattle have gone down their profits have been increased by just that much.

"Something has been said about the foreign trade. Undoubtedly that has been interrupted from the cause stated, but not interrupted to any extent which makes up the difference between the diminution in number of the cattle of the country, as compared with the increase of population compared with, say, ten or five years ago. The foreign trade in cattle has been controlled in the City of New York, in combination with operators in the city of Chicago, not upon the basis of the foreign demand, but upon the basis of the maintenance of a certain price for the home supply."

The first witness called before the committee was Mr. Dudley H. Snyder, the well-known cattle drover, residing at Georgetown, Tex. He explained to the Committee that his business was rather that of a cattle drover and shipper than that of cattle raiser, although he had raised cattle very extensively. In answer to the question as to the present condition of the cattle market, as far as the sale of cattle on the hoof was concerned, he said: "We commenced driving in 1868. The first cattle—that is, Texas cattle—we bought at one dollar and fifty cents to two dollars a head for one-year-olds; two-year-olds, from two to three dollars; cows and three-year-olds, about four dollars, and, I think, we bought our beef cattle at seven dollars. We took nothing over four years old, and nothing under yearlings. In those days we had to have a limit else we would get them heavier than we wanted to. For a number of years following the beginning of dressed beef we paid, in buying young steer cattle, a higher price for one and two year old steers than for like ages of heifers, from the fact that they were worth more. In 1871, I think, the drive of stock cattle commenced heavier from Texas. It is my recollection that six hundred thousand or six hundred and fifty thousand cattle were driven from Texas that year, the larger part being stock cattle. Then our prices began to advance steadily up to about 1880 and 1881, when they got up pretty high, it being the policy of breeders there, and, I think, it must have prevailed all over the United States, to take better care of the cattle and hold on to them as cattle grew higher in price. Hence, for a few years, along from 1881 to 1885, heifers would cost more than steers of like ages.

"I mention this to carry out my ideas of the business. I think the policy prevailed throughout the country of taking care of the heifer cattle, which, in a few years, gave us an immense supply of cattle. During those years, too, while cattle were going up to such high and fabulous prices, as I thought then, and think yet, a great deal of money was sent out from the East and from Europe to invest in cattle; and, in numbers of cases, cattle were bought at very high prices and at book account by men who did not know what they were doing, they representing large capitalists and syndicates. Therefore, I claim that in many instances where Texas cattle were bought at twenty dollars, they paid forty dollars on the book account. The same thing held good in Wyoming Territory, where we had a range also, the price there being about thirty dollars for stock cattle. I am sure, plenty of sales were made there where cattle were sold at thirty dollars a head, and on book account they cost sixty dollars or more.

As to the local conditions of the cattle industry, he said, as to Williamson County, where he resided: "It was simply an open country; hardly any farming was done in it. All the country northwest of me was an open country; it was unoccupied. Where the cattle are now covering the bulk of the ranges of Texas, there was then the buffalo. A few years ago I thought the cattle were certainly gone out of my county. I live right there, and I made it convenient to examine the Assessor's list for the country around me. I found that last year we ranged over fifty-four thousand head of cattle in my own county. That is a settled county. It has more cattle than it had when it was a cattle country, and when the northwest part of Texas was unoccupied. Now that country has been occupied, and the Territories have been occupied, and all the best ranges for cattle have been pretty much taken up, and yet the interior has not stopped producing cattle."

In reply to the question by Senator Manderson, Mr. Snyder said that the territory adapted for producing cattle was growing less all the time. The northwest part of Texas, and also the west, was

about taken up, and the necessity of shipping lighter and younger cattle than would otherwise have been the case was the result. The depression, he explained, had been very great in stock cattle, and in the lighter class of cattle they had been sold close, and there had been such immense shipments. Range steers, averaging from twelve hundred to fifteen hundred pounds, were as high this season as they were five or six years ago, but they were fewer in number.

Mr. A. P. Bush, Jr., President of the Texas Cattle Raisers' Association, was the next witness. He stated that he purchased his ranch in 1882, and moved on to it in the following year. The trade had been depressed and uprofitable for the last three years, due, he believed, to a combination of causes and to no one particular cause. One of these was the unlimited credit extended to the cattlemen, resulting in enormous liabilities being accumulated. These had to be realized out of the cattle, and this forced a large number on the market. The cattle thus forced on the market had not been, prior to that time, considered salable for beef. Hence, in his opinion, the main cause of the depression in the price of beef cattle had been a depression in the character of the cattle, and heavy shipments to market. He did not consider that there had been an overproduction, and the information brought to his notice did not bear out that idea.

An interesting feature of Mr. Bush's evidence was his statement that he was one of those who was attracted to Texas by the singular advertising the industry had received, and the exaggerated reports of prosperity to which we have alluded in the preceding chapter. Speaking of the unlimited credit to cattlemen which had affected prices, he said: "When cattle from abroad and capital from the East was attracted to the cattle business, then range cattle first began to be advertised as a great business, and began to attract the people. It had never done so before. It attracted me and I got into it. Not only people from the East, but people in Texas, and people in the Territory and people in the Northwest, bought and sold and traded cattle, paying what money they had, expecting prices to remain as they were and to be able to realize on the cattle, as the beef output then indicated, and as they would have done if the cattle had always been on hand that were sold."

The preceding year had been, he knew, a year of very large shipments, the largest Texas cattle raisers had ever had. "The stock of cattle to come from the Northwest," Mr. Bush went on to say, "we knew was somewhat depleted from losses. The stock of marketable cattle, steer cattle, to come from Texas we knew was depleted, because a large number of young cattle had been driven North, or had been lost, and a large number had been disposed of in various ways. The statistics will show that there were not the steer cattle in sight to market so as to equal the receipts of the season before. When this great increase in receipts began to come, it was not in steer cattle, but it has been largely in cows and cattle of that character, of all ages. There was an unprecedented number of calves and an unprecedented number of cows, born native and range; and there were instances where parties trying to get out of the business shipped their entire stock, all kinds and classes and characters, regardless of what they were. That is a class of cattle and a quantity of cattle that I did not anticipate, and I think many others did not anticipate that they would go into market to the extent that they did."

The next witness before the Committee was called under process, and was requested to enlighten the Committee as to the method in which cattle were being sold on the Chicago market. In reply to a request from the Chairman, he handed in the following list of current classifications and prices:

Northern Range steers	$ 2 65	to	$ 4 20
Texas steers	2 25	"	3 25
Texas cows	1 50	"	2 35
Veal calves	2 50	"	5 60
Milkers, per head	20 00	"	50 00

The prices, he explained, were those of November 20, 1888. He admitted that the Chicago market fixed the prices of later cattle that were packed, canned and dressed, when killed. As to the very heavy cattle, averaging sixteen hundred pounds and over, the prices in New York generally fixed the quotations in Chicago, because such cattle were shipped largely to New York, Boston, Philadelphia and Baltimore for consumption. The tendency to the concentration of receipts largely at one point had been to lower prices, and doubtless if the receipts could be scattered, it would help the sellers·

Referring to the sharp advance in prices of the preceding May and June, he attributed it to the appointment of the Committee, and was especially of that opinion because it was unusual for cattle to advance in price in the extremely hot weather, owing to the natural reduction of the consumption of beef. The more recent dropping down of the price was largely the result of an immense increase from the Northwest. There had been an immense amount of shipping from Montana during the fall, and the reduction in prices had not caused any great surprise to men in the business.

Mr. J. C. Beatty, of El Paso, Tex., was the next witness. He explained that about the year 1882 he moved from California to Texas, and was engaged in the business of raising, buying and selling cattle. Referring to the attempt made to establish a permanent refrigerator establishment in El Paso, he said: "We ran that plant for about six months, slaughtering just the beef cattle necessary for our own consumption in the town and the adjoining country there, as it was in the summer months. We furnished a very excellent article of beef four or five days old, something that we never had been able to get there before; the weather being so hot, we had to slaughter in the morning and eat for breakfast ordinarily. Our manager, Mr. Zeke Newman, went to California about a year ago, and made contracts in Los Angeles with local retail butchers, and also in San Diego and other towns north of those places, but in Southern California, to furnish them with so much meat per week during the winter. He came back and commenced slaughtering about fifty head per day. He continued the business for nearly two months. It made a nice market for the cattlemen in that part of the country, giving us about two and a quarter cents a pound for our steers right at our door. His own men took them off our hands on our ranches, and drove them to the town. He continued the business until the railroad company refused to give him cars to ship his beef to Los Angeles and San Diego. Mr. Newman had to cease slaughtering, and the refrigerator plant has been shut down from that day until the present time, except for the purpose of furnishing ice to the town.

"We had a nice market, shipping our beeves to California, to different points from Southern Arizona and Southern New Mexico. We were obtaining for these cattle, delivered in the stock pens at the different points of shipping, from two and one half to three cents a pound on foot, which we considered an excellent price. The Head and Hearst ranches sold nearly twelve hundred head at three cents. Along about the first of February Mr. Armour concluded that that business could not continue; that it was detrimental to his interests. This is the general understanding. Anyway, he shipped his beef in refrigerator cars to Los Angeles and San Diego, and there put it upon the market at a price at which we could not possibly compete without cattle going in on foot, and he broke the market for our cattle from three cents to one and one-half cents and one and three-quarter cents a pound; and it was done in less than ten days' time.

"The market was really a very healthy one for cattlemen. The butchers were all making money. I know they were very eager to get those cattle, and went down as far east as Brownwood, in Brown County, Tex., to gather up beeves during the winter months. This was in addition to the supply which we could put in the refrigerator, which did not affect the market. Only about fifty beeves a day could be put in the refrigerator. That did not affect the regular market, for we had a good market for beef. But the moment Mr. Armour put in his refrigerator beef, we were compelled to turn around and ship our steers to Kansas City, and sell them at a loss; and the same beef, I suppose, was sent back in refrigerator cars a distance of eighteen hundred miles to Los Angeles and San Diego."

The tenor of this witness's testimony was that the power of the beef combine, or the Big Four, had, by crushing out the El Paso industry, kept down the prices, wholly bringing about the unfortunate condition of affairs which had existed. He was followed by Mr. Brewster Cameron, who explained that he had been engaged in the growing of cattle upon the open ranges in Arizona for nearly six years. The cattle business was very much depressed, resulting, as he believed, from the absence of competitive markets. The Chicago markets controlled the principal markets of the country, with the single exception of those of California. "When the rangemen," said Mr. Cameron, "ship their cattle into the markets of Chicago, Kansas City or St. Louis, they are taken charge of by commission men. The producer has practically nothing whatever to do with the sale of those cattle. In fact, the buyers, as a rule, pay no attention to him. After they are turned over to the commission merchants, the producer has really no more to do with their sale than any one of the many hundred people who come there

every day, out of mere curiosity, to walk around on the fences and look in the pens where the cattle are. The cattle are disposed of chiefly to what is known as the Dressed Beef Trust. The butchers of the country, the feeders and all other buyers, with the exception, possibly, of the feeders who purchase in Chicago, do not have a free opportunity to buy in competition with the Big Four. The complaint of the rangemen in the country is not that the price of the range cattle is now too low; their complaint is that they do not have a competitive market.

"If, as the Beef Trust declares, there is an overproduction of cattle in this country, which, however, the producers deny, that will regulate itself under natural conditions under the laws of trade, if the beef combine is broken. All the producers want, therefore, is a competitive market. There are many producers of cattle now who are on the verge of bankruptcy, and are almost irretrievably ruined, who, several years ago, could have easily saved themselves, and who would undoubtedly have done so if they had believed at that time that the cattle business was governed by the laws of supply and demand, because they then would have known instantly that there was an overproduction, and they would have sold out at the prices they could have gotten at the time. But believing then, as they now believe, that prices are arbitrarily controlled by these men, for reasons which I will state later on, and that such prices are entirely artificial, they held on to their property in the hope that the time would soon come when this combine could not regulate the prices of cattle throughout the country, when they would be able to realize something out of their property. To particularize, as to my experience and information, I will state the following facts: I only made one shipment of cattle to Kansas City. I had an experience then which was very short, but which nearly every rangeman can testify to on a much larger scale, who has been shipping regularly to the Kansas City, St. Louis or Chicago markets. I brought there five hundred and seventy-eight head of cattle, if I remember correctly. They were divided off, as commission men divide them, into lots, so as to enable them to sell to the best advantage.

"As this was the first shipment I had ever made, I was, of course, entirely unfamiliar with the business. I stood around the pens and heard a great deal of discussion about the cattle. I heard a number of individuals, jobbers and feeders, express a desire to buy a part of them. I communicated this information, in a general way, to the commission men. They told me that it was better to sell them all in one bunch. I supposed it was myself, and they were accordingly sold, a portion of them for three dollars and sixty cents per hundred weight, which was a very good price for these times. I wished to thoroughly test the market, it being the first shipment made by me; therefore I had shipped various grades of cattle. They were all separated off according to grades. There was a great proportion of them in one grade. For that lot of cattle I was offered three dollars and twenty-five cents the first day. I thought they were worth more than that, and I held on to them. I got one offer after another, each a little lower than the former offer, until they came down to two dollars and fifty cents. Poorer cattle than those sold for higher prices between the time my first offer was made to me and the time when the offer was made which I was obliged to accept."

Mr. Cameron went on to describe at length the efforts he made subsequently to dispose of cattle directly in the East, and he condemned the Dressed Beef Trust and the Big Four in very emphatic terms, declaring that both butchers and cattle raisers were suffering terribly as a result of the operations of the combine.

Mr. C. C. Slaughter, of Dallas, who explained that he had been engaged in the cattle-raising business, gave testimony of the greatest importance as bearing upon the causes of the depression in the cattle-growing industry. Formerly he had disposed of a great many cattle at Pittsburg, New York and Buffalo, but in the last few years he had sold all his cattle in Kansas City, St. Louis or Chicago, and more especially the last named. He attributed the depression in the industry to the combination which existed. "I base my opinion," he said, "upon the fact that St. Louis was at one time a market in which I sold the principal number of my beef cattle. I am going back now to show how I made up my mind. St. Louis, as I say, was at one time a cattle market. I sold cattle there in 1882 for the highest price I ever sold in my life. I sold cattle that I raised on my ranch in Texas at the enormous sum of seven dollars a hundred. We think now that that is an enormous sum. They were

three-year-old cattle that weighed one thousand and eighty pounds, and never had eaten a bite of corn or anything except grass, to my knowledge. I sold them at seven dollars per hundred pounds in St. Louis.

"That was in 1882. At that time there were quite a number of establishments in St. Louis canning and packing cattle. Soon after that I found that those establishments were weakening; that they were not killing as many cattle as they had formerly killed. I found that if my cattle were sold here they went to Chicago. Naturally, I wanted to go to the head of the market, and I began to go to Chicago. I then began to ship cattle, as I had formerly done, though not a great deal before, to Kansas City, never considering that it was anything of an extra market. I drifted my cattle from Texas to the Indian Territory to graze, naturally throwing them farther west, and if I shipped to Chicago I took the nearest route and went by Kansas City.

"I found that if I offered my cattle at Kansas City for sale, and did not sell them, as soon as I would go to Chicago, before the cattle arrived, it would be known what I was offered at Kansas City, and it naturally brought me to thinking this is a strange coincidence; these fellows tell me just what I was offered at Kansas City, and they come up and just about offer me enough more to pay the freight, sometimes not so much. Then I would try St. Louis, and I found that about the same thing was going on there; that if I did not sell in St. Louis, and if I went on the passenger train to Chicago ahead of my cattle, the next morning, before their arrival, I would find that the offer was known that was made for them in St. Louis."

Several cattlemen, residing in Missouri and adjoining States, gave evidence of a similar character, and the majority of the witnesses were disposed to lay a considerable amount of blame upon the Big Four, and the absence of competition between different markets. These were followed by Mr. A. W. Willard, who admitted that he was a typical American, with a ready hand for everything, having been in the cattle business for eighteen years, as well as the grocery and banking business. The cattle industry of Texas was in a very depressed condition, and, so far as West Texas was concerned, the causes of the depression were obvious. In 1881 and 1882 the prices of cattle went up to a very high figure. Money from all over the Western States, and from England and Scotland, and other places, sought investment in the range country. That stimulated the raising of cattle in many places. The range became overcrowded. Since that time there had been in the range country unprecedented droughts. In the last three years in Texas the drought was unprecedented there. Lands had been bought in large bodies in West Texas that were open ranges, and they had been fenced up. Cattle had decreased in price. He could not see that there had been overproduction, though, for two years, a small percentage of cattle failed to get very fat. The dressed-beef business had had a bad effect on range-cattle prices, and he was one of the sufferers from the closing down of the refrigerator at El Paso, in which Col. Beatty and others were interested.

Mr. Jefferson Reynolds, of Las Vegas, New Mexico, was asked as to the condition of the cattle raising and shipping business, in which he was engaged. "The depressed condition in the prices that we receive for our steers was always a great surprise to us," he explained, "when we would hear from the East that the price of beef to the consumer was not declining in proportion. In order to verify that, when I was in New York I called at the different hotels, and I asked permission to examine the bills that they paid for meat in the last three or four years. Uniformly, they all agreed that they were paying the same prices now that they paid three years ago, and sometimes a little higher. I was also at Hartford, Conn., and I went to the hotels and butcher shops there and inquired about the prices they were paying now as compared with three years ago, and they told me they were paying higher prices in Hartford, Conn., now than they were paying three years ago. I explained to them that we were not getting within fifty per cent of the former price for our steers; and I asked the Hartford men why they did not come to the West, to New Mexico, and buy trains of cattle and avail themselves of the very low price of cattle in that Territory. They told me that they were afraid to do so; that the Chicago combination, which they represented to me as being Armour, Swift, Fowler and Morris, would establish retail markets in every city in New England, and would run them out of the business if they attempted to come into our markets and buy."

Speaking of prices, Mr. Reynolds said that he had been in business about seven years. During the first two years his steers brought him from twenty-seven dollars to thirty-five dollars a head. For

the following years the average was barely seventeen dollars, and since that time, or during the preceding years, he had been getting eleven dollars to thirteen dollars a head.

Mr. Ashley C. Halliwell, of the "DROVERS' JOURNAL," was called to give information with references to prices of cattle, and especially of those from Texas and the Indian Territory, during the preceding eleven years. He submitted the following tables, which contain information of great value, especially as bearing upon the question of prices as affected by production or overproduction:

EXTREME TOP PRICES FOR NORTHWESTERN RANGERS AND TEXAS AND INDIAN CATTLE, DESIGNATED "RANGERS," AND "TEXANS," RESPECTIVELY.

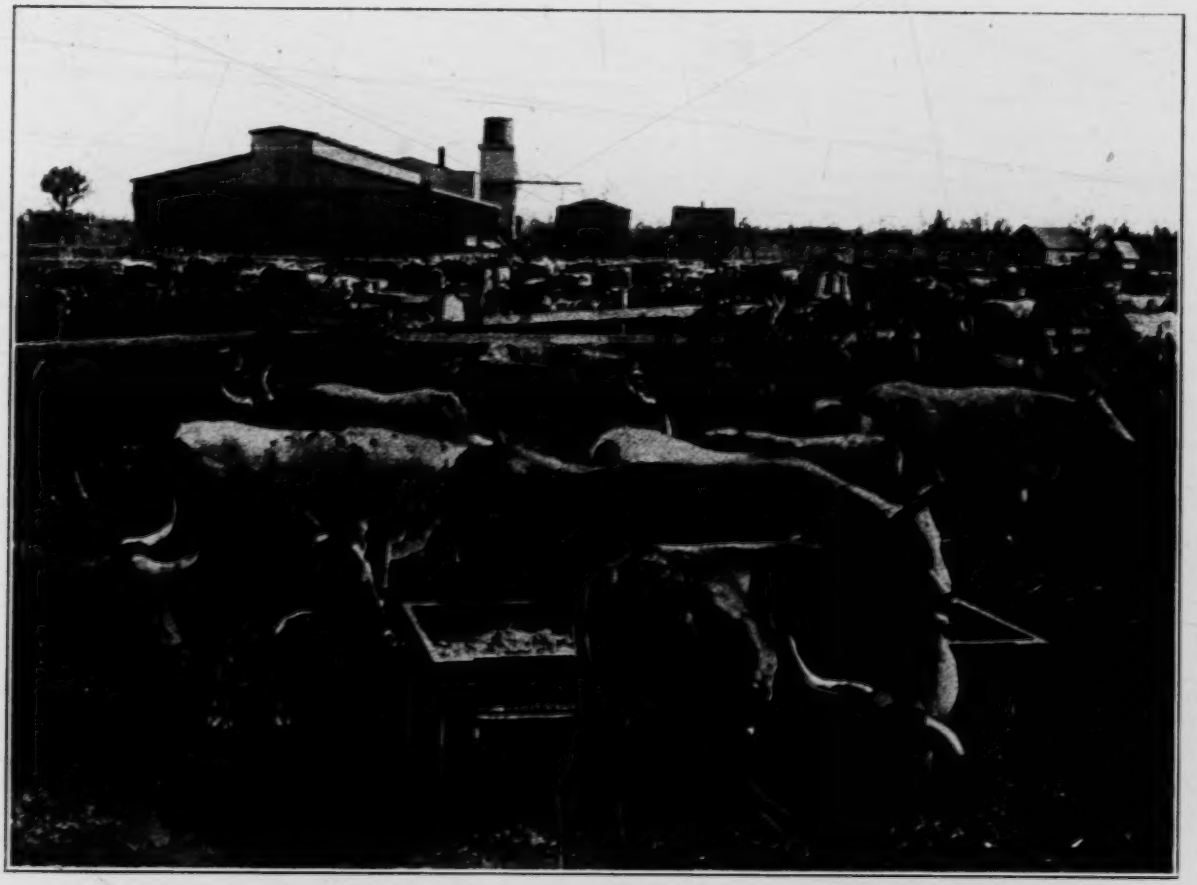
The first six months of each year represent "fed" cattle, and the last six months mainly show prices for "grassers."

He also made an important statement as to the receipts month by month of Texas cattle and rangers during the preceding seven years. The highest receipts in Texas were in 1887, when, according to his figures, 485,528 steers were received at the Chicago market. The smallest receipts for any year were for 1881, when the total was only one hundred and forty-eight thousand. The years 1883 and 1885 both showed reduced receipts, and the shipments for 1884 were all far the largest for any year with the exception of 1887. There had been far less variation in the receipts of rangers, which had varied from 176,680 in 1883, to 261,275 in 1887.

Mr. John Rector, an old resident of Austin, Tex., who had been in the cattle trade about four years at the time the investigation was made, was next called. He agreed with the preceding witnesses



COTTON SEED FEEDING PENS AT BROWNWOOD, TEXAS.

as to the depression in the trade, and attributed to the encroachment of agricultural interests upon cattle interests proper the falling off in profits. He knew that a great many cattle raisers were shipping cows in order to reduce their stock, the present low prices not being profitable. It was the custom to ship cows to market when they got fat and old, but he thought there were other objects now for the shipping. The railroads had not reduced the charges of transportation on account of the low prices of cattle, and he thought that it was unnecessary to look much further than the undue proportions of charges to prices for the cause of the depression.

Mr. L. C. Baldwin was called as an expert stock raiser. He stated that he had been in the business ten or eleven years in Iowa and Wyoming, and for twenty years farther east. There had been a decline in the prices he had received during the last two years of nearly forty per cent. He blamed the manipulation of the markets, rather than overproduction, for the falling off in prices. He was satisfied

that from 1865 to 1880 there had been a gradual but slight increase in the ratio of cattle to population. Since 1885 it was obvious, however, that there had been a marked decrease. He based his calculations on facts brought before his notice, and especially upon the immense number of calves and cows that were being sold for slaughter. In addition to this, men were going out of the cattle business because it was unremunerative, and hence the stock on several ranches had been forced on the market.

Asked how he could reconcile the falling in prices with the falling off in the number of cattle raised and fed, the witness said it appeared to be due to combinations between the existing markets. Communication was frequent and rapid between Omaha, Kansas City and Chicago, and the man who refused the price at one of the smaller markets and went on to Chicago, was punished for his temerity. So far as he could see, there had been very little reduction in the price of meat to retailers in consequence of the heavy falling off in prices for cattle on the hoof. He thought, however, that the inferior and cheaper portions of the beasts were retailed at a less figure.

No evidence taken by the committee attracted more universal interest than that given by Mr. Philip D. Armour, who has been described both as the archfiend of combinations, and as the prince of benefactors and trade improvers. It was the great object of the great millionaire to show by his testimony, which he gave with much reluctance, that the decline in the prosperity of the cattlemen, while it had kept pace in adverse ratio with a phenomenal increase in his own prosperity, was not the result of it. In other words, the burden of his argument was that the two events had no connection with each other, and, indeed, that but for his enterprise there would have been still more cause for complaint and lamentation.

"In my opinion," said the millionaire, "the leading cause of the decline in cattle values is the overproduction and over-marketing of cattle. The over-marketing of cattle has been brought about by the reckless investments and speculations in ranch properties, which placed a fictitious value upon cattle and resulted, eventually, in the withdrawal of money so invested, thus compelling many engaged in the business to prematurely market their cattle to realize on them. Other causes have contributed to bring about the depreciation in the values of cattle: The low price of hides, caused largely by the immense free importation of foreign hides; national and State legislation against oleomargarine, which not only taxed the article, but, by reason of restrictive and prohibitory features of such legislation, largely decreased its manufacture; quarantine laws and regulations, which have discredited at home and abroad the healthfulness of our cattle and beef products, and has been seized upon by foreign countries as an excuse for attempted prohibitory legislation and for agitating, through the press and otherwise, their exclusion from foreign markets. The competition which has grown up within two or three years in the vast cattle-raising regions of South America, Australia and New Zealand has also aided to depress the price of range cattle, and all the products from these cattle. These causes have also aided to depress the price of what is known as native cattle; that is to say, cattle from such States as Illinois, Iowa, Kansas, Missouri and Nebraska. The depreciation in such cattle, however, has not been so marked.

"The farmers and breeders of cattle on high-priced lands of these States have been forced into competition with growers of cattle on the cheap lands of the West and Southwest. In many cases they have been forced to raise and feed their cattle on their high-priced lands with expensive feed and care, and put them in the market with cattle raised on the public domain, which are only grass-fed and receive little or no care. The extension of railways in all directions into the range countries, and the improved methods of transporting cattle, have brought the grazing grounds and the great cattle markets so close together in time that the feeders and raisers of cattle in the States have no longer the advantage which distance formerly gave them. The changes brought about in the last fifteen years in cattle raising, not only in this country but elsewhere, have, of necessity, compelled a change in the manner of marketing and of preparing the products of cattle for consumption, as well as in the distribution and sale of such products. As an evidence of this, it is only necessary to call attention to the centralization of markets; to the changes in the equipment for the transportation of cattle for long distances; to the refrigerator car system, by which fresh beef can be transported for a long distance and ripen and improve during the transit; to the exportation of cattle, fresh beef and beef products to

LIBRARY

foreign countries, and to the transportation of fresh beef and mutton from Australia across the tropics, and the marketing of it in good condition in England.

"It is apparent, to understand and intelligently discuss the present conditions of raising and marketing cattle and the products of cattle, different rules must be applied than would have been in the same sort of an investigation fifteen years ago. To market the vast herds raised on what used to be called the plains of the West and Southwest, to slaughter the same and prepare every part of the animal for market in which the consumer buys in the thickly-populated parts of this country and in Europe, is a very different problem than when the raiser of cattle sent his drove on foot to a near market, where it was distributed among small buyers. To pay to the raiser of such cattle a price which will leave him anything after paying the expense of raising and marketing them, it is necessary that the greatest possible economy shall be used by the slaughterer, and that no particle of the animal shall be allowed to go to waste if he hopes to put products in the market of the consumer at such a price as will bring him customers.

"The price for all portions of the bullock, except those for the fancy cuts of prime beef to consumers, have declined in an equal degree with the decline in the price of the live animal, as an investigation of the prices of the different products of beef for a number of years will clearly show. The difference in the price obtainable for canned meats has been more marked than upon any other product of beef, and it is the direct result of the overproduction and over-marketing of inferior Southwestern cattle, and to competition with cheap frozen mutton and beef from Australia, New Zealand and South America in European countries. The magnitude of the canned-meat industry will be readily seen when it is known that during the year 1888, 584,333 cattle were slaughtered in Chicago for canning purposes, or almost one-third of the entire number of cattle slaughtered at that point.

"The depression in prices, and the present state of the cattle markets, are due to the overproduction, especially of grass-fed cattle, the marketing of immature animals, which are too thin for the block (this has affected all corn-fed and native cattle, except the choicest), and enforced competition of farmers raising cattle on higher-priced and highly improved farms of Illinois, Iowa, Missouri, Kansas and Nebraska, with the ranchers of the West and Southwest, who herd thousands of this character of inferior cattle upon public lands or lands of little value. The gradual absorption of the range by actual settlers, and overproduction of range cattle, has greatly overcrowded the remaining range country, and has, consequently, lessened the quantity of grass and impaired its nutritive quality. As a natural result, grass-fed range cattle have deteriorated in weight and value, and the Southwestern steers now coming in weigh from ten to twenty per cent less than the steers of a similar character did six years ago. Grass-fed Southwestern range steers are not as good to-day as they were then, and cannot be expected to command the same prices.

"A few years ago large fortunes were realized in the herding of cattle in all sections west of the Missouri River, and capital from New England, the Middle States, England, Scotland, and the Continent was recklessly invested in this new enterprise. Men without experience bought whole herds by brands and book account, supposing they were receiving what they actually paid for, and it is generally conceded that in few instances would the actual count of the animals exceed seventy-five per cent of the number shown by the book account. Because of the great demand for ranches, and consequently inflation of cattle values, investors often paid for such cattle greatly above their actual value. With the truth came distrust in the business, bankers called loans and refused accommodations, and a rush ensued on the part of many investors to market their cattle, and quit the business. Many other causes have since transpired to depress this branch of the cattle business, and to cause the overproduction of cattle, among which may be mentioned the thinning out of large ranches, as the Government lands have been taken up by actual settlers, the overcrowding of other ranges, drought and short pasture, severe winters and a necessity upon the part of cattle corporations and owners for the realization of quick profits to meet the payment of guarantee dividends or of interests and mortgages. I am fully convinced that the farmers of Illinois, Iowa, Missouri, Kansas, and Nebraska have suffered serious loss in cattle values because of the effect upon the cattle market of such overshipment.

"In recent years the cattle business has been conducted on a large scale by incorporated companies and wealthy individuals, who find it necessary to ship cattle to market in large numbers, and, therefore,

must have centralized markets in which they can easily and quickly dispose of them. The changed conditions of cattle raising have necessitated and compelled these large or centralized markets, as they are called, without which it would be impossible for large raisers and shippers to dispose of their cattle, and without which it would be impossible to successfully carry on the export trade in dressed, salted or preserved meats. Such markets are the effect of the present condition of cattle growing and marketing, and not the cause.

"Whilst it is admitted that heavy receipts of cattle, especially light ones, from the Southwest, has had a marked effect upon the cattle values of all beef animals, it will still be found true that really choice cattle usually command a reasonable price, because the supply rarely exceeds the demand. Four dollars per hundred weight was the lowest price paid for first-class stock in 1888; a fair average for the entire year would be about five dollars per hundred weight, and in many cases the price has run up to seven dollars. The complaints of low prices for cattle have come from the shippers of lighter grade, and only rarely from the owners of first-class stock.

"Another evidence of overproduction, and one which shows that the cattle raisers themselves recognize it as the true cause of depressing markets, is the large number of young cows and heifers which are being sent to the slaughtering pens, and the large number of young heifers that are annually speyed. When the ranches and farms are so thinned out as to make the supply of cattle nearer the demand, and when we can market our surplus abroad, we may expect to see steady and proper cattle value; for it is a well-established rule of trade, that the surplus of any commodity in the market will tend to reduce the value of the whole production of that commodity. The dressed-beef industry has proved most beneficial to cattlemen and beef consumers alike, for without it it is safe to say that cattle would bring a price sometimes not more than the freight. The dressed-beef business is so concentrated, and is conducted upon a scale of such magnitude, that dressed-beef men can profitably utilize the offal and other waste products of slaughtered animals, which are absolutely useless to small slaughterers.

"The dressed-beef business is protected by no patent. The methods employed in slaughtering the animal and preparing its products for the market are well known and open to any one who wishes to engage in it. Armour & Co. have wholesale beef markets and agencies throughout the country. Through the press and otherwise we advertise the products we have for sale and the prices, and keep our beef and our products constantly before the public. To these markets everybody is invited. Our prices are quoted to every inquirer, and any person can readily see for himself whether we are charging or receiving exorbitant prices or not.

"*There has never been any combination or agreement of any kind between the firm of Armour & Co., of which I am a member, and any other party or parties, to fix the price which we should pay for live cattle, or to control the price which should be paid therefor, nor has there been any attempt on the part of this firm, in connection with others engaged in the dressed-beef business, or with other purchasers of cattle, to control or depress the market for cattle.* The firm of Armour & Co. is not in any combination with other parties in the dressed-beef business, or with shippers of beef in the carcass to fix the price for which beef carcasses shall be sold. We do arrange price-lists for cut meats and canned meats from time to time with others producing those commodities. This is done according to the state of the market as to supply and demand, and is absolutely necessary to protect dealers in these articles from the sudden and violent decline in prices which would otherwise follow an oversupply. In no case are the prices quoted exorbitant, nor would it be possible to make them exorbitant and maintain them for any length of time. The almost unlimited supply of such cattle, and the limited demand with which the market affords for these articles, make the exacting of large prices impossible.

"We do the best we can to buy cattle as cheap as we can. As a good merchant, I would not be here very long if I would not do that. Look at the advertisement it would give me to the commission man, and it would go quick, instantly all over the wires. I could not do that with Mr. Swift without the commission man knowing it, and that would go direct to the men who ship the cattle, and the next time they would not come near me at all. I do not believe any man believes in this combination who will come to the market and go down to the packing house and see the methods and see our system. I do not think there is a man who would then say that. I am sure there is not a man who would. I

think there have been a great many people beyond cattlemen who, seeing this big decline, have believed there was something wrong, and that the Big Four was a Jesse James."

To this last remark Senator Vest replied: "I can say to you that I have never talked with one cattleman (and I have talked, I presume, with five hundred) who did not solemnly asseverate that he did believe it. One man said, somewhat cautiously, that he was not sure of it. I do not say that that makes it so, but I am talking about the public opinion existing."

Mr. Michael Lynch, of Saline County, Missouri, attributed the decline in prices to the combination, the existence of which Mr. Armour denied. "Before the combine," he said, with much earnestness, "I generally got paid for my corn and my labor. Since that has taken place I have generally worked for nothing; I do not get anything for my corn or for my labor either. I was up in Chicago last New Year's, on the second day of the month, with Mr. John Kennedy, a neighbor of mine, and Mr. Loftus, besides others from the same neighborhood. Mr. Kennedy and I had good cattle. The cattle cost me at home, north of Slater, four cents a pound. I bought them the first of September and fed them until the second day of January. They ate up about fifteen hundred dollars in corn. I had paid four cents for them, and they weighed one thousand one hundred and eighty-seven pounds a piece. They cost something like forty-six dollars cash at home. I fed them about fifteen hundred dollars' worth of corn, at thirty cents a bushel, or one dollar or one dollar and fifty cents a barrel. The corn would have brought me that much, or it may be more. I sold the cattle in Chicago, and I was probably out five hundred dollars or six hundred dollars, besides my corn. I had to pay interest on the money. A man who can not sell his cattle for something over and above what he pays for them generally has to go into debt for the price of the cattle. When I came back I had to repay that money to the bank out of my other funds. So I was out entirely. I do not see any competition there at all. I have not seen any, in fact, for three years that is worth speaking of. Heretofore, if a fellow came in to buy your cattle, and the bid did not suit you, he went out and another man came in directly afterward, and they kept on coming until you got something like the value of your cattle, and you finally sold them. You go there now, and stay all day, and see only two or three buyers, and they will always go together and give you one bid, and it may be they will raise five cents or ten cents on it, and you will have to take their bid or quit. That is my experience at least.

"Both Mr. Kennedy and I had one thousand four hundred and forty pound cattle. There was but a small difference between our cattle in weight. We got into Chicago, I think, at six o'clock in the morning. We went out and had breakfast, and came back to the yards immediately afterward. We were very anxious to sell our cattle and get home that evening. We held our cattle, I think, until two o'clock, and we only got a raise from four cents to four and one-tenth cents, and we never saw a buyer anywhere near. I know that none came around our cattle, because we were right with them in the pen all the time. None came around except those three men, and our commission man said those men belonged to the Big Four, but I do not know who they are. I have never seen them, but I have heard enough of them to know who they are. They are not a very good class of people. They skin poor men; at least they skinned me badly. I did not see any competition there at all. No other man made us a bid. Nobody came around our cattle who was buying."

An immense quantity of additional evidence was taken, and the inquiry extended over several months, the Committee meeting in different cities. We have extracted and condensed, from the immense mass of documents published by the Committee, evidence and statements which appeared to bear most directly on the causes of depression in the cattle industry. The Committee presented its report to the United States Senate in the spring of 1890, or about two years after it was appointed. The report is entirely too lengthy to be reproduced in full, and we must content ourselves with a few brief extracts from it and a general summary of results.

The report is distinctly unfriendly to the Big Four, and the International Cattle Range Association is charged by Senator Vest with having hindered rather than helped the Committee in its investigation as to the influence of the dressed-beef monopoly. The centralized condition of the cattle market is named as the principal cause of the reduction in prices, or, at least, as one of the most important factors. The Evener Combination, in the years 1873 to 1878, is severely criticised, and its marked influence in making Chicago the great cattle market of the country is proved by a series of figures.

Statements follow as to the growth of the dressed-beef business, and tables are given to show that while only thirty-eight per cent of the gross receipts of cattle went into the hands of those controlling this business in 1878, nearly seventy-five per cent went into their hands at the time of the investigation. In other words, while the number of cattle received at Chicago in twelve years had increased from one to three millions per annum, the number of cattle slaughtered for the dressed-beef trade had grown from less than half a million in 1878 to more than two millions in 1889.

Mention is made of the fact that the agents of the dressed-beef houses at first refused to appear before the Committee, and had to be forced into attendance by means of subpœnas. "In an atmosphere so hostile, and surrounded by such influences," the report goes on to say, "the Committee found their duties at Chicago singularly unpleasant and difficult. The people and press at Chicago naturally sympathized with the vast interest which expends millions of dollars weekly in that city, and from no quarter came the slightest sympathy or encouragement for those who were supposed to be even critical as to the packing and dressed-beef establishments. The overwhelming weight of testimony from witnesses of the highest character, and from all parts of the West, is to the effect that cattle owners, going with their cattle to the Chicago and Kansas City markets, find no competition among buyers, and if they refuse to take the first bid, are generally forced to accept a lower one. This testimony comes from representative men, not emotional or prejudiced, but conservative, intelligent observers, of whose sincerity there can be no suspicion."

The report goes on to point out that other evidence was forthcoming to prove the existence of a combination between the dressed-beef magnates, and the next section challenges the accuracy of Mr. Armour's argument that low prices were caused by overproduction. In 1850, it is pointed out, the number of cattle in proportion to population in this country was seven hundred and sixty-seven to every thousand. In 1860 the number had increased to eight hundred and fifteen, a figure which had never since been reached, although in 1885 it rose to eight hundred. At the time of the inquiry it was practically the same as it was in the year 1850, and exactly the same as in the year 1882, so frequently named as one of exceptional prosperity in the cattle trade.

Over-marketing is next dealt with as one of the causes alleged for the falling off of prices and the depression in the trade. The result of investigations convinced the committee that a very large number of people really believed six years ago, as they do now, that the over-marketing of beef cattle is one of the most obvious reasons for the falling off in the prosperity of the cattlemen. Witnessess had stated that the reckless investments in ranches and cattle made a few years previously by inexperienced speculators, and the reaction which had caused many to abandon the business in despair, had thrown upon the markets large numbers of immature animals, thereby producing an oversupply and a consequent depreciation of prices.

"It is said, and with much plausibility, that the reckless investments in ranches and cattle made a few years ago by inexperienced speculators, and the reaction which has caused many to abandon the business in disgust and despair, has thrown upon the markets large numbers of immature and unprepared animals, thereby producing an oversupply and consequent depreciation of prices.

"It can not be doubted that there is some truth in this statement, and that the facts alleged have contributed to present conditions, but it is impossible to accept this as the principal cause for low prices. As stated in the report of the Agricultural Department on the beef supply, 'The demand for meat for home consumption should be tolerably constant in a series of years like those of the present decade, during which there has been no marked financial depression.'

"In addition to this fact, it must be remembered that the demand for canned beef and of cattle for exportation has steadily increased. This being conceded, the market returns at Chicago should prove the truth of the over-marketing theory beyond question. If over-marketing has been the principal cause of low prices, then this cause should operate regularly and systematically in the same direction from month to month. When a large supply of cattle is in market, prices should decline, and with a decreased supply they should go up. Of course, no one can expect, in any market, a mathematical and procrustean rule as to anything, but, supply being the controlling factor, prices should be governed accordingly, or the conclusion is irresistible that some other and more potent cause is controlling. Keeping before us the fact that population has been increasing in a greater ratio than cattle, as shown

by the report on the beef supply already quoted, and the additional facts that exportation and improved methods in preparing the beef product and its transportation have increased the demand for cattle, we invite attention to the following, taken from the official reports of the Union Stock Yards at Chicago:

"In August, 1886, there were received at the Union Stock Yards, 86,130 range and Texas cattle, which sold at the average price of $3.20.

"In September, 1886, there were received of the same grade, 114,566 cattle, which sold at $3.00.

"In October, 1886, there were received of the same grade, 134,639, which sold at $3.05.

"In November, 1886, there were received of the same grade, 73,488, which sold at $2.90.

"In December, 1886, there were received of the same grade, 25,060, which sold at $2.80."

Attention is called to the fact that in his testimony, Mr. Armour emphasizes the statement that the fall in prices has been greatest in grass-fed range and Texas cattle, and the committee therefore selected this grade to test the theory of over-marketing.

It will be observed while in September, 1886, there were received at the yards 114,566 of these cattle, the receipts increased in October to 134,639, but instead of decreasing the selling price it rose from three dollars to three dollars and five cents. In November the receipts of these cattle decreased 61,171, but the selling price instead of rising under a short supply actually fell from three dollars and five cents in the preceding month to two dollars and ninety cents. In December the receipts were only 25,060, a decrease from November of 48,388, but instead of raising prices they fell to two dollars and eighty cents from two dollars and ninety cents in November.*

The following tables were regarded by the Committee as showing conclusively that overmarketing does not explain the fall in prices.

Texas and range cattle received at Union Stock Yards:

TEXAS AND RANGE CATTLE RECEIVED AT UNION STOCK YARD.

MONTH.	1886		1887		1888		1889	
	Price.	Number.	Price.	Number.	Price.	Number.	Price.	Number.
September	$3 00	114,566	$2 65	130,424	$2 80	115,719	$2 55	145,885
October	3 05	134,639	2 60	162,442	2 65	163,509	2 70	182,407
November	2 90	73,448	2 50	121,419	2 80	104,725	2 65	95,757
December	2 80	25,060	2 40	64,700	2 65	44,700	2 50	33,115

The prices in the above are the highest for the months named. The following table gives the range of prices at Chicago, from the highest to the lowest in all the months of 1889:

MONTH.	Fancy and export.		Western range.		Texans.		Cows, light stock.		Stockers.	
January	$4 25 to	$5 40	. . . . .		$2 70 to	$3 75	$1 50 to	$3 00	$2 65 to	$3 30
February	3 75	5 00	. . . . .		2 30	3 30	1 50	3 00	2 35	2 25
March	3 75	4 85	. . . . .		2 50	3 65	1 50	3 00	2 00	3 35
April	4 00	4 75	. . . . .		3 10	4 00	1 50	3 15	2 90	3 60
May	3 90	4 60	. . . . .		2 40	3 65	1 50	3 80	2 50	3 75
June	4 00	4 70	. . . . .		2 10	4 00	1 25	3 35	2 25	3 35
July	4 00	4 55	$2 40 to	$3 65	2 45	3 65	1 50	3 00	2 50	2 85
August	3 75	5 00	3 55	4 10	2 60	3 10	1 40	2 60	1 75	3 25
September	3 80	4 80	2 75	4 00	2 00	3 10	1 50	3 00	. . .	. . .
October	4 00	5 15	3 00	4 00	2 20	3 40	1 75	2 74	2 15	2 75
November	4 20	5 50	3 00	4 00	2 00	3 15	1 50	2 75	2 00	2 80
December	3 90	6 10	2 50	3 40	1 80	3 40	1 25	2 75	5 20	2 80

* The members of the Senate Committee appear to have overlooked the fact that the very small shipments in December were partly the results of force of habit or custom, and partly of the miserably low quotations, which made cattlemen hold back as long as possible.

Nothing could more completely dispose of the overmarketing theory than the fact that in October, 1889, there were marketed at the Union Stock Yards more Texas and range cattle than in any other month since the yards were established, the increase being 36,522 over the preceding month. Prices rose under this unprecedented market from two dollars and fifty-five cents to two dollars and seventy cents. Not only does the overmarketing theory fail as to Texas and range, or grass-fed cattle, but the prices of the better grades sold at the Union Stock Yards show the same result.

In August of the same year the number of all grades at Chicago was two hundred and ninety-seven thousand, and the average price of beeves, weighing from twelve hundred pounds to fifteen hundred pounds, for that month was three dollars and ninety-five cents. In September of the same year there were in the Union Stock Yards two hundred and seventy-six thousand cattle, and the average price of the same grade of cattle was three dollars and ninety cents. In October the number marketed was three hundred and thirty-one thousand, and the averaging selling price of beeves, weighing twelve hundred pounds to fifteen hundred pounds, rose from three dollars and ninety cents to four dollars. In the next month, November, the whole number of cattle marketed fell to two hundred and sixty-one thousand, but the price of the grade above mentioned fell also to three dollars and eighty-five cents, instead of rising as it should have done. In December of the same year the whole number of cattle at Chicago decreased to two hundred and fifty thousand, but the price of the same grade we have named still further declined to three dollars and eighty cents.

The official sales at the Union Stock Yards for the years 1884 to 1888, from month to month, show beyond a question that overmarketing did not cause the decline in prices. "There is some other more potent factor at work," says the report, "*and we have no hesitation in stating as our conclusion, from all the facts, that a combination exists at Chicago between the principal dressed-beef and packing houses which controls the market and fixes the price of beef cattle in their own interest.*"

An advertisement from an English paper is next quoted by the Committee to show that in one year the Big Four made a profit equal to about twenty-nine per cent of its capital stock, and other figures are quoted to show that on a steer purchased for twenty-five dollars, there was a clear profit to the dressed-beef men of seven dollars and thirteen cents. It did not appear to the Committee that the retail butchers were responsible for the high prices of beef still charged to consumers. After making several inquiries on this subject, the Committee came to the conclusion that while there were individual butchers whose charges were excessive, retail butchers, as a rule, were making not more than eight or ten per cent on their investments. A table is given showing that even with the low prices for cattle, which were enforced at the end of the eighties, choice cuts, including porter-house and surloin steaks, were actually commanding higher prices per pound than in 1870.

Mr. Armour had explained this to the Committee by stating that there had been an increase in the demand for the choicer cuts of beef not kept pace with by the demand for cheaper cuts. During the five years then preceding, there had been a falling off in the price of cattle on the hoof from an average of five dollars and thirty-five cents per hundred to three dollars and eighty cents per hundred, and it was impossible for the Committee to conclude that during this brief period the taste of the consumers underwent so marvelous a development that the rib and loin beef could alone satisfy it. "Unless," the report goes on to say, "the retail butchers are the most conscienceless liars in existence, the profit does not go to them. The Committee is satisfied that the bulk of the profits unquestionably made under present conditions goes to the combination of dressed beef and packing houses."

The remainder of the report consists of an exceedingly interesting dissertation on transportation rates, followed by a number of suggestions as to inspection and by a number of figures as to the growth of the export beef trade. The monopoly of export transportation is commented upon, and the Committee concluded its labors by making a variety of suggestions, to which we shall allude in the next chapter, the scope of this chapter being an inquiry into the causes of the depression and the circumstances, errors of judgment, combinations, etc., which brought it about, rather than remedies for those evils.

CHAPTER X.

Remedies Suggested for Stagnation and Low Prices.

THE present outlook for the cattle trade of the Southwest is decidedly brighter than it has been for several years. In the opinion of many most competent judges, the excessively high prices of a dozen years ago are not likely to be reached again for a generation, unless a cattle famine should set in, in which case there will be, for a time, no limit to the offers made for cattle of almost any description for slaughtering purposes. But during the last few months there has been a distinct improvement in the general demand, with a general stiffening of prices, and cattlemen speak much more hopefully now than they did two years ago. Texas cattlemen, in particular, have come to the conclusion that it is a condition and not a theory which confronts them, and they have accordingly taken steps to prevent a recurrence of the calamity of the last few years. Of the success which has attended the efforts made in the direction of improving the breed of cattle we shall speak at length later, and may only pause to remark here that this in itself will prove a most important factor in competition with cattle raisers and feeders elsewhere.

The stall-feeding of cattle has also received in Texas, during the last few years, the attention it deserves. Steers are being fattened on cotton-seed meal by the tens of thousands with exceedingly satisfactory results. Cattle so prepared for market seldom go begging for buyers at reasonable prices, the great falling off in demand and in quotations having been in lighter grades of steers. The altered conditions which prevail in what was formerly the greatest range district in the world, have rendered these changes in the methods of cattle-raising and feeding imperative, and the manner in which the changes have been realized and accepted speaks volumes for the intelligence and good sense of the cattlemen generally.

The Senate Committee, to whose labors we referred at length in the preceding chapter, suggested a number of remedies for the depression it discovered, or rather whose existence it admitted. So far as we have been able to learn, very little practical benefit has resulted, and the inquiry must be regarded as of greater value from an educational standpoint than from a purely practical one. At the very outset of its report the Senate Committee states that so long as the combine at Chicago can dominate the entire cattle market, depression is inevitable. The market might rally and advance for a time under manipulation, brought about to induce shipments, but the same conditions would, in the long run, prevail as during the preceding five years. It is pointed out that Congress cannot give relief against trusts and combinations confining their operations within State lines. This relief could only be given by the State authorities. The bill recently passed by the Senate on the subject of trusts would, if it went into operation and were enforced, have some effect on the illegal conspiracy to keep down prices; but it was useless to disguise the fact that desperate exertions would be made to nullify any legislation offering a remedy.

The committee quotes the various attempts to enact local inspection statutes in State Legislatures as evidence of the means which would be used by those now controlling the cattle market to defeat all interference with their profitable pursuit. Without expressing any opinion in regard to the propriety of such legislation, the committee mentions as a matter of history that laws providing for the local inspection of cattle on hoof before being slaughtered had been declared invalid by judicial tribunals in Minnesota, Indiana, Kansas and Virginia.

The report concludes with an address to the cattle raisers of the United States, which is so full of thoughtful advice and so commendably brief that we reproduce it in full:

"If the cattle raisers of the United States are only true to themselves, the immediate future promises deliverance from present evils. There is no excuse for panic. The worst feature of the cattle trade is the fact that so many cows and calves are being thrown upon the market, the indication being the producers are panic-stricken and anxious to realize without regard to the future. There were marketed

at Chicago during the past year 3,023,281 cattle, of which from twenty-five to thirty per cent were cows, and four per cent were calves. A little reflection will satisfy every man that no combination can keep the prices of beef cattle at present quotations. The population of the country is increasing in a wonderful ratio, and of course the increase is greater each year. The foreign demand for American beef is annually growing, and it can only be a short time until our stall cattle will be admitted into the United Kingdom. The British cattle raisers are earnestly opposing the removal of all restrictions upon the importation of such cattle, but if our authorities earnestly address themselves to the task the difficulty can be removed.

"Besides, the cattle-growing region in the West is being rapidly limited. The admission of new States and the settlement of agricultural lands, the quantity of which is enlarged by systematic irrigation, must necessarily decrease the grazing area. While this is so, there will be an increased demand for beef with increased population, and enlarged facilities for the preparation of beef and its transportation to new markets.

"It is impossible that the Chicago market should continue to control the cattle interest of the whole country, as it does now, or that a few large operators shall retain their hold upon that market. This is a new country, not yet out of its first national manhood, and rapid development, with the phenomenal transition from one commercial condition to another, must attend our future. The center of population is moving westward, and the center of trade must change with changing population. As lines of railroad penetrate the continent, and new territory is opened to commerce and production, the distributing centers must, of course, be affected, and so it will continue to be until our country has reached the last stage of national development and danger—that in which the soil is sustaining human life to its fullest capacity.

"The cattle raisers of the United States should be, and are, the most competent judges as to their own interest; but if they will accept a suggestion from those whose duty it has been for months to examine the cattle question in all its aspects, they will cease marketing their breeding and immature stock, and diligently prepare for a larger supply and a brighter future. It is only a question of time, and very brief time, when the problem will be that of supplying our own people with beef, without regard to foreign markets.

"Under present conditions, and until we escape from the abnormal and ruinous centralization of the cattle market and its domination by a few men and railroad corporations, every effort should be made for deep-water improvement on the Gulf of Mexico, diplomatic endeavor to remove quarantine regulations in Great Britain, national inspection, and the prohibition of monopoly in steamship transportation, to enlarge our foreign market; but eventually it will require all the cattle produced in this country to supply the home demand."

Passing from the Senate Committee and its labors, we come next to the attempts made by the butchers of the United States to fight the dressed-beef combine, or the Big Four. These efforts were commenced nine years ago, and have been steadily continued year after year. The Butchers' National Protective Association was established in 1886, and its first Convention was held in St. Louis in May of that year. Its officers have always claimed that its interests were distinctly allied with, and not antagonistic to, those of the cattlemen, and the greatest efforts have been made, from time to time, to enter into alliances calculated to defeat the Big Four and its agents. The contention has been made that, while the prices of cattle on the hoof have fallen, the prices of butcher's meat have been stationary, and that when prices of meat have increased, neither the producer nor the retailer has reaped the benefit.

The butchers attribute the falling off in the prosperity, both of the cattle and the retail butcher trade, to the Big Four, and their hostility to that combination has at times been almost picturesque. At the first Convention held by the body to which we are referring, Mayor Francis spoke very plainly about the danger of monopoly. "A sad day," he said, "it will be for this country when the dressed-beef interests are in the hands of a few moneyed kings. A sad day it will be for the farmer who raises the cattle when a select coterie can establish the price, which they will pay, from day to day, for the cattle which are brought to market, and a sadder day it will be for the people at large who consume this beef."

The Mayor's coupling of the two interests was received with enthusiastic applause, and the Convention got down to business with very little delay. One of the first speakers, Senator McGinniss, gave his attention very considerably to the live stock interest. "This dressed-beef movement," he said, "has already very seriously affected the live stock business, receipts on the hoofs during the last few years not having kept pace with the increase in population and consumption. In fact, it is claimed that the receipts now are not actually equal to what they were five years ago. If the live stock trade from the West and Southwest were alone affected, this would not be of such grave importance to the country, but it is also very seriously affecting the beef production of the Middle and Mississippi Valley States. It is a part of the policy of this syndicate to discourage and reduce to a minimum the beef production of the corn belt of the United States, so that it may have a freer field for its operations.

"A blow most serious, far-reaching and lasting in its results, is thus being struck at the farming interests of the region named. It is only within the last few years that the farmers of this great district have come to understand generally that tame grasses and cattle paid better, and was more reliable, than such crops as wheat, corn and hogs; and in the meantime they have come to understand, too, that grasses and cattle return, to the almost exhausted soil, those elements of fertility of which it has been depleted by a long and almost unbroken succession of cereal crops. Competition with the cheap, nasty dressed beef, will compel the abandonment of this system, to a large extent, and millions of acres will be turned from pasture lands into wheat fields, and the manure, which should go towards enriching those fields, will become dust and be blown away on the plains of the great cattle ranges, and we of the cities will have no cheaper beef for it all in the long run."

The Senator went on to point out the difficulties in the way of legislation. While Mr. Vest had expressly stated that legislation aimed at checkmating the combination of which he complained must emanate from State Legislatures, Mr. McGinness argued as a lawyer that it must of necessity emanate from Congress. Differences of opinion, such as these, have intervened to the hindrance of good work again and again since the efforts at reform commenced, and possibly these differences are the prime cause of the practical failure of nearly every remedy attempted.

The committees of the association, as well as the parent body, worked hard for several days and passed a number of important resolutions bearing on the subject, as well as many relating to the plans to be adopted in the future. The members of the association pledged themselves not to trade in monopoly dressed beef, and to protect home industry in every legitimate manner. As an evidence of its determination to do this, it deliberately invaded the camp of the enemy and held its second Convention in Chicago. The Mayor of that city sent an apology for being unable to work on the delegates, but that did not prevent a very active campaign being inaugurated. President Thomas Armour, who, it may be explained, is not connected in any way with the dressed-beef millionaire, delivered a most carefully prepared address, in the course of which he referred to the cattlemen's difficulties which were then, 1887, at their height. The uninitiated, he pointed out, were wondering how it was that cattle were being marketed at such low prices on the hoof without any corresponding reduction in prices by retail butchers. The fact could easily be explained, and the cattlemen had been wrestling with it for years. He wanted to make it clear that in the beef supply of the country certain agencies were necessary between the producer and the consumer. The producer who lived away from the markets required some one to sell for him whom all recognized as the commission man. The consumer could not handle the cattle and these two middle men were always necessary. In olden times all subjugated countries paid tribute to Cæsar. Chicago had become the Rome of the cattle trade, and every beef that was sold in the United States had to pay tribute to the modern Cæsars. Various plans had been suggested for getting rid of the incubus of this monopoly. His idea was to secure slaughter houses in central points and fight the dressed-beef monopoly with its own weapons. Such a plan could be conducted at a profit, and it would really solve the difficulty to a great extent.

Mr. Bentley was introduced to the meeting as a member of the great community of Texas cattlemen, and he made a very interesting address bearing upon the question in which the cattlemen took so much interest. After explaining that he lived in the land of the longhorns, and knew something about the influences which had depressed the stock business for the last two years, he said he had come to the conclusion that the only hope of redress for the range-country stockman was in an earnest and

hearty co-operation with the butchers of the country. Only recently he was told by a member of the dressed-beef syndicate that capital had enabled them to secure control of the beef markets of the country. And what had been the result of the doing away of the competition? Cattle which two or three years before had fetched them from fifty to eighty dollars per head now rarely brought more than twenty or thirty dollars, and the producers generally had suffered a loss of a fifty-per-cent production on their cattle generally. He asked the butchers of the Convention to unite heartily with the cattlemen in a vigorous fight on the monopoly, and believed that if this was done the power of the combine could be broken.

Several other speeches followed in the same vein, and Mr. Barber, of Washington, gave an interesting summary of dressed-beef combines and their immediate results, the Convention finally adjourning full of hope as to the future.

In 1888 the association met in Philadelphia to resume its attacks on the combination, which, it believed, had interfered so seriously with its business. Many points to which we have already alluded were brought very prominently to the front; and an address was delivered by Mr. A. S. Mercer, of Cheyenne, Wyoming, which brought to a focus the great points at issue between the parties. From his speech the following extracts are taken because of their practical bearing on the subject:

"There are to-day one hundred thousand men in the United States engaged in the work of butchering cattle, cutting up meat and supplying it to the consumer. There are to-day nearly half a million men in the great West engaged in the business of raising cattle to sell to the butchers. There is a community of interest between the producer of beef and the butchers of the United States; the producers' interests are yours, and your interests are the producers'. Hence, no question is more important than that of unity of action between the producer and the manipulator of meat, and between these two and the consumer, who represents the great mass of people. To-day sixty million people in the United States are listening for the voice that shall go out from this Convention on the question of adulterated food. The women and children of this country, even the little ones that are nestling in their mothers' laps, are interested in this question. It is a question whether we will raise up strong men and women or a race who may be tainted with leprosy. It is not a question of a moment, but one that shall reach down through all time.

"I want to make one or two general propositions, which can be substantiated any moment by figures. In 1883 Chicago, St. Louis and Philadelphia, the old Centennial city, were great cattle markets. New York, Baltimore and other cities were not only great commercial and manufacturing cities, but the live bullocks of the West were found there in your stock yards, were brought there by the butchers, were slaughtered there, and good beef was to be found everywhere. To-day there is but one market in the United States, and that is at Chicago. In 1883 from fifty to one hundred buyers were to be seen daily in the stock yards at St. Louis—buyers from New York, Jersey City, Philadelphia and all the other markets—and there was a legitimate, honest competition by men who wanted the products of the West. Cross the river and enter the National Stock Yards at St. Louis to-day, and you find no buyers other than a few of the local residents who want a bullock or two slaughtered. Go to Kansas City, and you find, notwithstanding the great, overshadowing dressed-beef houses standing there, there are no buyers. New York is not represented there, Boston is not represented there, Philadelphia is not represented there; none of the great consuming centers are represented even in that marvelous young city on the borders of the Missouri. The same thing is true of Omaha. Every place to which the cattle of the plains were formerly brought presents the same condition until you get to Chicago.

"In 1883 fourteen hundred and forty-one car loads of live cattle were hauled over one line of road from the West, and distributed in Philadelphia and Jersey City markets. In 1887 less than one hundred car loads were hauled by the same road and dropped at these two points. Why was this? It was because the supply was diverted to Chicago. In 1883 the same line of railroad delivered to Chicago, out of its entire haul of five thousand car loads, only thirteen car loads. Last year all of its haul went to Chicago. In 1883, when the people were paying for their chops, steaks and roasts no more than they are paying to-day, we were getting forty dollars for a steer. At that time Texas, the mother of the plains-cattle industry, was driving or shipping yearly one hundred thousand beef steers to New

Orleans and other Southern cities. After being driven across the State and shipped across the Mississippi, they were sold to the butchers and slaughterers at home. To-day New Orleans, Memphis and all those places are supplied with refrigerator beef from Chicago; the live cattle being shipped to Chicago, instead of going direct to New Orleans, and the beef being sent down in ice boxes—and I need not speak to you of the ice box as a source of epidemics.

"We have heard much talk about the wonderful Big Four at Chicago. What does it mean, and who are the Big Four? That is a question that comes straight home to the butchers, and it comes even a little straighter home to fellows like ourselves out West, who raise the cattle. It is simply a combination in Chicago of four men, who handled last year over one million and eight hundred thousand out of the two million and three hundred and eighty-two thousand head of cattle that were thrown on that market. Five-sixths of all that immense collection of cattle delivered in Chicago were bought, slaughtered and shipped out by four men.

"Now, what is this leading to? This question is one for the consideration of the butcher and the producer. We are both in the same boat. If four men in Chicago can to-day handle five-sixths of the beef product of the United States, and if those four men have, as I understand from unquestionable authority they have, ruled out one-half of the butchers of this country, how long will it be until they have controlled the other sixth, or until the other half of the butchers of the country will become mere cutters of meat for these four men?"

Mr. Mercer's address caused special prominence to be given in Eastern and central circles to the Wyoming Stock Growers' Association, which was one time regarded as the most powerful cattlemen's organization in the world. Its roll of membership was at one time magnificent in its proportions, and many of its members amassed large fortunes during the balmy days of stock growing. Its operations were mostly carried on by an Executive Committee made up of representatives from Laramie, Albany, Carbon, Sweetwater, Uinta, Fremont, Johnson and Crook Counties, Wyoming, and Cheyenne and Sioux Counties, Neb., Dakota and Montana also being represented. Resolutions of a very important character were passed from time to time by the association, some of them being designed to generally regulate the affairs of the trade, while others were more distinctly prepared with a view to helping out the trade in its depressed condition. Early in the eighties, or just at the time when the trade was at its turning point in the matter of prosperity, the association divided Wyoming into round-up districts, and prohibited the branding of cattle between February the 15th in any year and the general spring round-up. It also issued a series of instructions to round-up foremen of the most valuable character, although they are more a relic of the past now than of any practical utility, owing to the changes in the condition of the country and methods of herding and raising cattle.

The Wyoming Association was a member of the National Cattle Growers' Association of America, generally called, for the sake of brevity, the Chicago Association. It also recognized the International Range Cattle and Horse Growers' Association, and generally evinced a desire to co-operate with any institution designed to better the interests of its members and of the cattle interests generally. In one year it recovered and returned to owners three thousand head of cattle which were detected at various shipping points and Indian agencies. A great deal of attention was directed to inspection, and to investigations as to diseases of cattle and how they could be defined and detected. The organization also did good work in securing territorial legislation, including bills regarding branding, the payment of damages for live stock killed by railroads and injured by dogs, as well as local inspection methods based upon rules of common sense and good judgment. That the word "Maverick" is not confined to Texas, and that it acquired what may be termed a classical or strictly regular significance outside that State, may be gathered from the fact that the Territory of Wyoming passed an act several years ago entitled an act to provide for the gathering and sale of mavericks, a measure which, by the way, had many points to recommend it.

Before the Convention adjourned, it was resolved that the Chair appoint a committee of five members, with full power to act, to confer with the International Range Association for the purpose of establishing closer relations between cattle raisers and butchers. Resolutions were also passed thanking the members of the Vest Committee for the efforts they had made to unmask the dressed-beef monopoly, and get at the truth of the very important question which affected them all so much.

The association, which was now more closely affiliated than formerly with the cattlemen, met the following year at Detroit, to resume its efforts and to carry on its attacks on its much-hated foe. The question of beef inspection was the most important one that came before the meeting. The friendly relations which had been established a year before with Mr. Mercer, of the "NORTHWESTERN LIVE STOCK JOURNAL," were severed, and that gentleman was referred to in very severe terms, on account of his alleged failure to advocate the cause which he and the butchers were supposed to be fighting for in union. A resolution was passed severing the connection formed the preceding year, and from the standpoint of the cattleman very little was effected in the way of co-operation. The Committee appointed to meet the National Range Association reported certain results of a more or less indefinite character, and the Convention finally adjourned, to meet again the following year and resume its crusade.

During the same year, 1889, St. Louis was again the scene of a great Cattle Convention. This time the grand hurrah which characterized the proceedings of 1884 was conspicuously absent. Instead of a vast number of prosperous business men meeting to compare notes and exchange congratulations, it was rather a gathering of stern, indignant gentlemen demanding certain rights at the hands of the Government and the country. Colorado, Iowa, Minnesota, Kansas, Indiana, Texas, Missouri, Illinois and Nebraska were represented by large delegations, and the Convention, whose stated object was to determine upon proper means to abate the evils brought about by the beef combine, got down to business very rapidly.

Senator Gillette, of Kansas, who was called to the chair prior to regular organization, delivered an address marked by great earnestness, and he was followed by others who spoke with equal force. Mr. Mercer, of Cheyenne, Wyo., having lost favor with the dressed-beef men, his admission to the floor was in consequence contested, with the final result that he was declared not entitled to a seat in the Convention. An immense number of resolutions were submitted and discussed, one after the other, until it was finally determined to concentrate efforts on two bills, one of which called for the suppression of trusts in a more vigorous manner, and the other calling for local inspection. Neither measure has been enacted in the comprehensive manner desired, and hence the wisdom of those who drafted the bills cannot be fairly criticised or commented upon. Great satisfaction was, however, felt by all present at the result, and the members went home feeling, at least, that they had succeeded in getting in the thin edge of the wedge against the hated combine.

The Butchers' National Association met at Cincinnati in 1890, when Mr. S. D. McCormick delivered a characteristic address on the conditions of the beef industry, from the branding of a calf to the selling of a porter-house steak. Mr. McCormick's style is well known, and the force of his indictments is unlimited. He opened his remarks by characterizing the cattle pool as a "despoiling agency," and directed his attention to a series of inquiries as to how the cattle industry could be rescued from it. He considered that the very existence of the cattle interest was at stake, and that it was only necessary for the butchers to combine with the dressed-beef men to practically annihilate the cattle-growing interests altogether. Unless something definite could be done, and done promptly, the United States would soon be compelled to import beef from other countries at a loss terrible to contemplate.

Taking Senator Vest's report as his authority, Mr. McCormick traced the history of the combine, and denounced it in unmeasured terms. A few years ago, he pointed out, millions of cattle were breeding and growing on the hills and dales of the United States. The business was active and competition was rife. A mature bullock was worth from one hundred dollars to one hundred and twenty dollars, while at the time of which he was speaking an animal of the same grade and weight was of little or no value on account of the killing of all competition. He denied, very vigorously, that overproduction was the cause of this difficulty, and argued that under present conditions the ranchman was in the position of a slave, living in fear of a boycott and unable to transact business on a living basis. The men who must be made the champions of the movement they had in hand had to fight, not to cripple the combine, but to annihilate it. They could help do this by the measures recommended by the Vest Commission, though this in itself would not meet the case. His plan was to counter-organize. His remedy was not revolutionary in character, but it involved the organization of those interests which were dependent upon the live stock market. This could be done by the butchers and the cattlemen

combining in one grand effort, and working hand-in-hand to crush out monopoly and maintain prices, not at unreasonable figures, but at competition prices.

As a result of this spirited address and other speeches which followed, the following preamble and resolution was adopted: "Whereas, it is important to sustain many of our languishing interests, particularly the cattle industry; and whereas, this Convention is ready to co-operate with any fair plan which shall organize and utilize the opposition to monopoly; Be it resolved, That this Convention appoint a Committee of not less than five or more than nine, which shall include the President, and that this Committee shall be known as the National Conference Committee of the Butchers' National Protective Association. The object of this Committee is to further the organization and the advancement of the interests of the Butchers' Association; to confer with other industrial committees, and to devise ways and means to sustain the live-stock markets of the United States. To this end, this Committee is hereby armed with plenary powers to reassemble this Convention at any time; to treat with all similar committees appointed by other representative industries; to receive suggestions, and to aid all just efforts tending to build up our interests in pooled cities, or any places where competition is now destroyed, and to devise some concert of action between cattle producers and consumers, especially in counties or cities threatened by the combine."

The resolution was not regarded as a mere matter of form, nor was its passage looked upon as settling the questions at issue for all time. The association, and more especially its indefatigable Secretary, Mr. Christopher Brokate, of St. Louis, lost no time in hunting up practical measures for fighting the hated combine with its own weapons. At the next Convention, which was held in Alleghany City, Pennsylvania, in 1891, it was announced that arrangements had been made with representatives of the great cattle interests of the Texas plains. As one of the speakers enthusiastically put it, "Texas is with us. Yes, thanks be to God, where the cattle is raised, on the great plains of Texas, where to-day they are feeding cattle enough to feed the whole world if necessary. They are with us, and I tell you that before this Convention closes I hope steps will be taken to effect the object we have in view." This object was the establishment of abattoirs and packing-houses on a large scale in Texas. It was argued with much force that the dressed-beef interests could be easily combated by the establishment, on a co-operative plan, of slaughter-houses near the plains on which they were raised.

Mr. A. Gardner, of the Dallas Stock Association, explained a proposal to establish a mammoth refrigerating plant in Dallas. It was proposed that the Butchers' Association should place a five hundred thousand dollar plant in the city named, receiving from the Board of Trade a bonus of one-tenth

that amount. He believed that the cattlemen would subscribe a hundred thousand dollars or more stock, and that the proposition would culminate in results of a most beneficial character to all concerned. It was finally resolved that the National Protective Association endorse the movement of the butchers of Dallas in building an abattoir and stock yards, and it looked for the moment as though the matter was definitely settled. Representatives of Fort Worth and other cities of Texas gave life to the movement by offering a little competition, and once more there was a prospect of a new market opening up for the cattle of the Southwest.

In May, 1892, the Convention met at Dallas with a view to completing the arrangements suggested and outlined in the East the preceding year. Mr. F. F. Elliott, of Dallas, in an address of welcome to the delegates, spoke with much enthusiasm as to the prospects. There were in the State, he pointed out, eight million head of cattle, one-tenth of which were beef steers. The feeding of cattle had been conducted on a more systematic plan of late than formerly. Vast quantities of local products were available for this purpose, and, in addition, cotton-seed meal and cotton-seed meal cake had come into use. Eighty tons of cotton-seed meal cake had been crushed the preceding year; and this, mixed with the hulls or with hay, was capable of fattening a quarter of a million steers in a hundred days. Dallas was in every respect suitable for the great refrigerating plant proposed to be put in, and the city was prepared to put up a fifty thousand dollar bonus for the purpose of encouraging the location. The special committee appointed at the preceding Convention for the purpose of selecting a site reported in favor of Dallas, strongly advocated the proposition, and recommended that the Butchers' National Association issue four thousand five hundred shares of stock at a hundred dollars a share.

The matter was not allowed to go through without competition, Kansas City, Austin and Fort Worth being competitors for the plant. After the claims of each city had been presented, Mr. J. S. Armstrong spoke in favor of Dallas and presented some arguments in favor of discontention. He pointed out that the freight on dressed beef from Dallas to New York was seventy-five cents. The cost of taking a steer from Texas to Kansas City was fifty-five cents, with additional charges which made a total of $1.10 a hundred pounds. This showed a margin of profit in favor of local slaughtering. Beef could be turned out and sold for two and a half cents dressed at Fort Worth, Austin, Dallas or any other of the points named, which would not be worth more than two cents had it been killed in Kansas City, on account of the bruising. These figures were unanswerable, and he considered Dallas exceptionally able to meet all requirements of the projected enterprise.

Finally, Dallas was unanimously selected for the purpose in view, the Austin representatives graciously voting for that city when they saw that the general feeling was in its favor. Mr. Secretary Brokate, in commenting on the result, said that, at last, steps had been taken to hit the combine with its own club. If the cattle raisers of the West would show their courage, he would guarantee that the butchers would show theirs. He would remind the cattle growers that the butchers had been the first to raise the cry against the Big Four. He regretted that the joint Convention of butchers and cattle raisers called at St. Louis had resulted in a fizzle, and he hoped that this time satisfactory results would follow.

Unfortunately for all parties concerned, the hopes of the Secretary were not realized. We are aware that the project was not universally approved in Texas and the Southwest, but we are inclined to attribute its failure much more to the depressed condition of the cattle trade than to any feeling of either animosity or indifference. More than once it has been pointed out in this work that, during the immense activity of the cattle business, large sums of money were borrowed from time to time for the purpose of investment, or, perhaps, over speculation, in stock and lands. The calling in of loans has been mentioned as one of the most obvious causes of the depression in the industry. It induced, among other results, an undue marketing of unripe cattle, and it also spread a feeling of alarm against anything bordering upon speculation or the incurring of additional liabilities.

Hence, although the Butchers' National Abattoir Association of America was permanently organized, it did not achieve the object in view. The Eastern butchers failed to contribute stock as liberally as expected, and it was also found that the expected financial support did not materialize from the stock-growing districts. Hence, like so many other efforts that have been made to restore the cattle trade to a condition of prosperity, and like so many cattle-growers' associations, the movement

passed peacefully and sadly into history. Other refrigerator plants have been erected and operated in Texas, as already stated. At present none of these are operated on a scale of great magnitude, though some are doing good work and rapidly bringing themselves to prominence and importance. So far as the National Butchers are concerned, the failure of the grand culminating effort at Dallas put a stop to the co-operating movement with the cattlemen, and the National Association is now confining its attention to matters more directly of immediate concern to the retail butcher trade. The feeling against the dressed-beef interest is much less marked than formerly, except among a minority of cattlemen and a majority of the butchers. The "Big Four," as it is almost universally called, continues in operation and appears to be making money just as rapidly as ever, in spite of rapidly increasing competition in almost every direction.

It must not be supposed that the feeling against the Big Four was unanimous. One gentleman who does not care to be quoted, but who has served a life-long apprenticeship to the cattle trade, said to the writer recently. "The attacks on the dressed-beef people were, in my opinion, the work of demagogues rather than practical men. Of course, the Big Four bought as low and sold as high as they could, just as any trader does. But I doubt whether there was ever any immoral combination to keep down prices of cattle on the hoof. It has been said that the Big Four killed the St. Louis market, and made Chicago the greatest cattle market in the world. It did nothing of the kind. It was hope that made Chicago take the lead. The cattleman, when dissatisfied with prices, will almost always go farther in the hope of doing better, even if authentic quotations show that he takes grave chances in doing so. Thus, whenever a man at St. Louis or any other intermediate market thinks he is offered too little for his stock he has reshipped it to Chicago, and I believe millions of dollars have been lost in this way by shrinkage, freights and disappointment. This same 'hope' is the reason why the refrigerator plants near the ranches have not done the business which was legitimately theirs. As long as there remains a chance of getting a fraction more by shipping farther, that chance is going to be taken, no matter what the risks may be. In my opinion, and I think I know what I am talking about, Texas cattle would be selling to-day at one dollar and fifty cents a hundred were it not for the dressed-beef plants, which take care of the surplus product."

It has been sometimes said that a man with a number of physicians is in as much danger as broth which is watched by too many cooks. It would be ungenerous to say that comparatively little benefit has been derived from the various attempts made to better the cattle industry during the last eight or nine years. It is, however, certain that many cattle raisers have been bewildered by the multitude of advice which has been tendered from time to time. For this reason, and also because we have already given as much space to the subject as the results would appear to warrant, we will reproduce but one more manifesto of the cattlemen. This was prepared and issued last year by one of the largest commission men in the country, and is so full of good advice that no apology is needed for reproducing it. "You may have spent all your life in the State of Texas," says the manifesto or circular to which we refer: "You may have been born and reared there in the cattle business; you may imagine that you understand the cattle business and cattle interest of your own State as well as any other man living; you may have been raised on the frontier of your own State; you may have spent nights astride your horse, riding around your herds in the darkness, and in the midst of roaring storms and the hissing of rattlesnakes; you may have lived for years on bacon, black coffee and hard bread; you may have seen your cattle roam over vast areas of territory, and mingle and mix with your neighbor's cattle; you may, perchance, have branded a few of your neighbor's calves, and, perhaps, he has branded some of yours; you may have lived in Texas in the days when there were no railroads or transportation facilities for your cattle; you may have driven fine herds of beef steers from the Lone Star State to the Northern market; you may have met the Northern trader on the frontier of the Indian Territory or Kansas and dickered with him for the sale of your beef steers at so many dollars a head; you may have received what you considered good prices, and what paid you a fair profit for the investment, the time and expense in producing your steers; you may have had your vast territories consumed by capitalists and corporations, and you may have narrowed your own holdings down to a small pasture, and have seen the boundless prairies, which were once covered with the virgin grass, eaten off into the ground by your starving herds; you may have seen what was once big, fat four and five-year-old beeves and rolling

fat cows and calves, dwindle into insignificant, small-boned, narrow, sway-backed, cat-hammed steers; you may, perhaps, too, have paid some good banker twelve or eighteen per cent interest for money to invest in a wire fence in which to put your cattle so that you could starve them to death.

"You, too, may have concluded that when you got your cattle fenced in with good barb-wire fences you could turn them over to your foreman and the cowboys, and live in town in a fine mansion and wear good clothes, like bankers and other people sometimes wear; you may have succeeded beyond your most sanguine expectations in running the ranch and making money, but all your experience in your own native State or the State of your adoption, whether you have been successful or unsuccessful, does not prove that you do not live in one of the grandest States in this Union, and an empire within itself. It is well-nigh impossible for cattlemen raised in the Northern States of this country to visit your State and not become enthusiastic over the grand possibilities that surround you in your own country. And with the finest climate of any State in the Union, and the greatest variety, richest, deepest and best soil, there is no reason why Texas does not possess all the necessary qualifications of a great country; and we are persuaded that but few of her present citizens realize the great possibilities that are around them in their own State and home. And as your State has always been a great range-cattle producer in former years, it is destined to become a great beef producer of fine-fed beeves; and with the finest climate in the world and the richest and best soil known to the inhabitants of this country, and the richest and best that the American flag floats over, there is no reason why, with the proper energy and the natural facilities that your country possesses, your State should not and will not become the foremost State in the Union as a producer of beef and pork, cotton and oats.

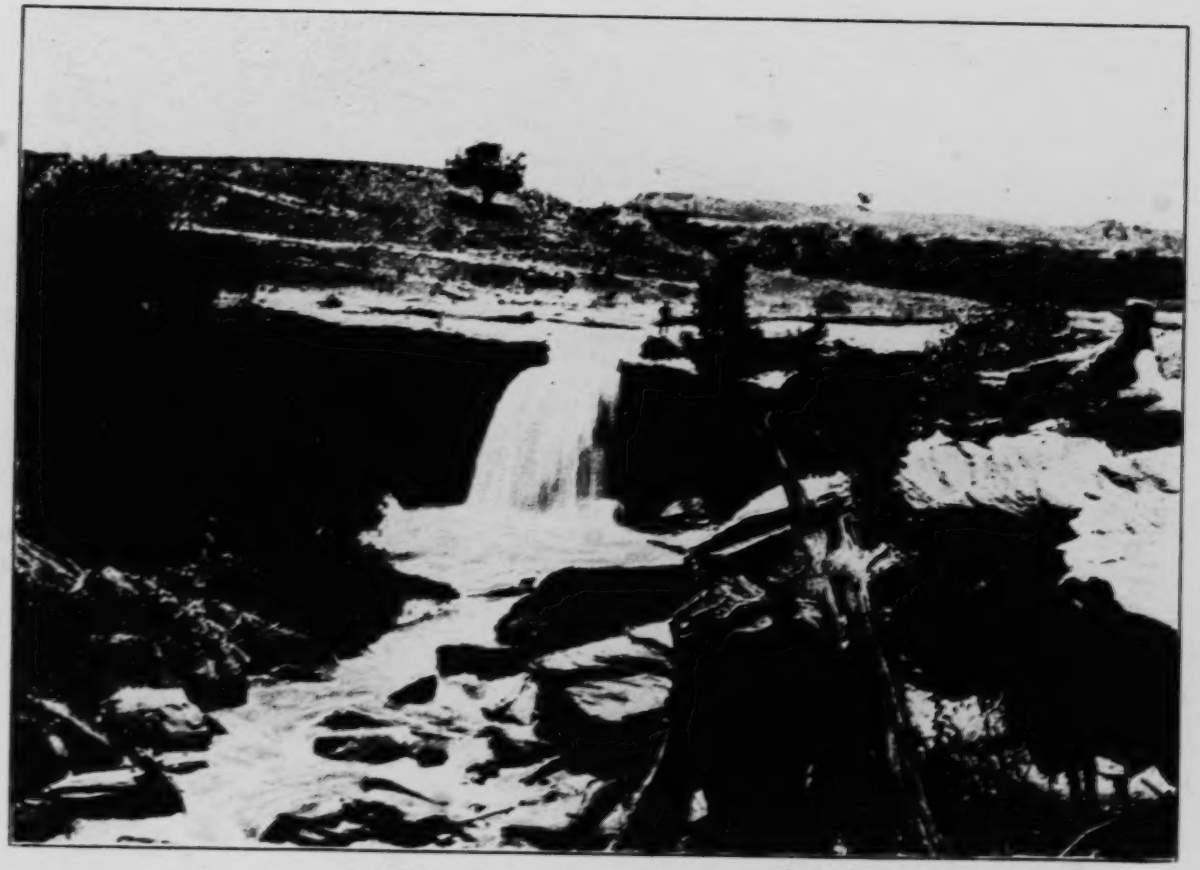
"If you have any feeding cattle on hand the present year (1894), and desire to feed your crop, the writer wants to suggest that the best cattle to feed at the present time and under the present circumstances, to get the best results, is to buy good, fat calves and yearlings, such as can be bought at any of the yards at from $2 to $2.25 or less, or from $7 to $10 per head. Such cattle can be fed for six months with a much better profit to the feeder, according to the amount of money invested in the animal and the feed consumed, than any other grade or kind of cattle at the present time. You should prepare your stock for market between the 15th of March and the 15th of June. This time of the year good, thrifty eight-hundred-pound steers always sell well, and almost as high as any other kind of cattle on the market. And the writer thinks that the pounds of beef on this class of stock can be made at less cost to the feeders than on old and larger cattle, as these young cattle grow rapidly and fatten fast, and consume less feed in proportion than older and larger cattle, and make more desirable beef animals for the market in the early spring months.

"It makes but little difference whether you buy heifer or steer cattle; either kind will fatten rapidly and grow fast, and be ready for market during the spring months. This class of stock can be carried through the winter, when properly sheltered and properly fed, to a much better advantage than larger and older cattle; and if you desire to make two feeds during the year, you had better feed your steer cattle on grass and shelled corn through the spring and summer months, as at the present prices feeding cattle costs, and the price of corn, if you undertake to feed a steer, say that costs thirty-five dollars, for six months, he will have consumed so much feed and corn that the probabilities are that he cannot be sold in the beef cattle market at a price that will justify or pay the feeder for his outlay or interest on the money and feed consumed. But if you commence feeding your steers in March or April, and feed them shelled corn, with plenty of roughness or good grass, you will make pounds much cheaper and much faster than you could by feeding through the fall and winter months on high-priced cattle. The trouble with most feeders at the present time, and which prevents them from making money, is that they let the cattle consume too much corn, and the corn is too valuable and worth too much money for the steer to ever pay back what he consumes when he is sold. And for this reason we advise our friends and customers with good steer cattle to feed them during the spring months, during the warm weather, where the cattle can have plenty of grass, and pounds can be made relatively much cheaper than during the fall and winter months on this class of stock."

There is no good reason existing in the minds of any well-informed handler of cattle why cattle should not be selling at this time for one or two dollars per hundred more than they are now bringing, except the financial condition of the country. At the beginning of the year 1893 cattle were active

and strong, and sold readily at profitable and satisfactory figures to owners, but with the advent of the panic beginning in April, prices of cattle, as well as that of every other product of the farm, declined to a point where it was absolutely impossible to produce without actual loss. With the rapidly increasing population, and a prospective decrease in receipts of cattle in the different market centers of the country, and a continual slaughter of cows, heifers and calves, and where it was shown by Government statistics that there is but a few more cattle in the country than there was a year ago, there is no other way to account for the low prices, except that manufacturers all over the country are not running or doing business, and that, in consequence, there is a larger number of idle men in the United States than ever before known, and the demoralization of finances in this country, and the fears of capitalists and bankers, and the uncertainty of tariff and other laws, have brought about and produced a stagnation in business, and while cattle, hogs and sheep have probably kept up and held their own as well as other commodities, and while owners and purchasers of stock have probably met their obligations more promptly than any other class of business men, yet the demand for our products is not what it should be nor what it should have been.

However, it is only reasonable to hope and expect better prices in the near future, the condition of the market in the spring of 1895 showing that it is only a question of time. With increased population, and when the wheels of our manufactories all over this country have commenced to turn, and our mines once more assume active operation—as they surely will in the near future—there is no question but that the products of the farm will again increase in price, possibly twenty to forty per cent above what they are at the present time, and on the whole, it is really encouraging for owners and shippers of cattle, hogs and sheep, and that as every dark cloud has a silver lining, so the cattle trade of the United States has a bright future for those who stay in the business and conduct it on an economical business basis.



DRIPPING SPRINGS FALLS, PALO DURO CANYON, TEXAS

CHAPTER XI.

The Cowboy, as He Was, and Is, and is Supposed to Have Been.

IT is doubtful whether any human being in any age or generation has ever been so absurdly caricatured and misrepresented as the cowboy.

The writer of these chapters of history remembers an amusing scene witnessed by him at Arkansas City in the spring of 1889, which may be recounted here as an illustration of the difference between the cowboy as he is thought of in the East and as he really exists in the West and Southwest. It was on the eve of the opening of Oklahoma, and Arkansas City, like other border towns of Southern Kansas, was inundated with boomers, home-seekers, land-office lawyers, town-lot speculators, and that peculiar class of people which is always so freely represented on the occasion of the opening for settlement of public lands.

The Santa Fe train was coming in from the North and Northeast, and there were probably two thousand people in and around the depot. The train was of unusual length, and was crowded even to the platform step, with more than one "boomer," whose enthusiasm was greater than his pocketbook, stealing a ride on the trucks under the passenger cars. All sorts and conditions of men and women emerged from the train and set out in search of temporary lodgment, pending the wild rush which was to take place on the following Monday.

Among the last to leave the train were two individuals fearfully and wonderfully attired. To say that they were armed from top to toe, was to express the case mildly, for not only did each carry a Winchester rifle, but he was encumbered with a cartridge-belt and a revolver, the latter of no uncertain size or make. As to their general attire it may be said not even Solomon, in all his glory, was arrayed like one of these. The hats were white and each was about as large as a lady's parasol. To judge from the size of the boots the men might have been engaged in an effort to "corner" the leather market, and the dazzling appearance of each coat and vest cast Joseph's coat of many colors completely into the shade.

A large number of cowboys had come in from the Strip that afternoon, and various remarks passed among them as to who and what these extraordinary individuals could be. Some of the opinions which were passed around were the reverse of complimentary, and as the two heavily laden men dragged themselves and their accoutrements up the hill into the town they became the center of general observation, and the look of blank astonishment which overshadowed their countenances was amusing. Arriving at their hotel, their first procedure was to summon the bell-boy and send him out to purchase two ordinary-looking suits of clothes, two No. 7 hats and two pairs of shoes. The fit in no case was excellent, but when they entered the dining room a little later they were at least clothed and in their right minds, and approximately happy.

These gentlemen represented two New England publications and had been sent out to write up the scenes at the opening of Oklahoma. Not wishing to be taken for Eastern tenderfeet, and believing the stories as to cowboy manners and customs that had been told them, they had, at much trouble and expense, secured the outfits which, while they might have been very appropriate in Wild West shows, were absurdly out of place in every-day life. Everybody ought to know that the difference in the dress generally worn by dwellers in Eastern and Western cities is in matters of detail only, and that all stories of ridiculous attire are sensational and foolish. The gentlemen who had thus been imposed upon were the first to recognize their mistake, and when they left the land of the cowboys two weeks later they promised to do their best to correct the absurd misapprehensions which prevailed in the vicinity of their homes.

Nor is the estimate and idea of the cowboy's attire as found in the East much more erroneous than the opinion which prevails as to his disposition. Some cowboys like to be looked upon as dangerous

characters and bad men, but they are in the minority, and their bark is always worse than their bite. Mr. W. S. James, who was for twenty-seven years a cowboy, a maverick or a nester—the three names are practically synonymous—in his interesting work descriptive of his life on the plains, says, very aptly, that were it not for the fact that every genuine article is sure to have a counterfeit, the genuine cowboy would be ashamed to acknowledge his identity, so universally has the term "cowboy" been abused. "The cowboy," says Mr. James, "is confined to certain localities, and, consequently, is subject to impositions that seldom fall to the lot of other characters. This is largely due to the sensational stories written about him by people who, as a rule, know no more about life on a ranch than the hog knows about the solar system. The first evidence of a cowboy's counterfeiter so often seen is the small boy, as he leaps astride the broom-handle with an imaginary quirt and spur, with a leather band round his little cap and a twine string for a rope, and as he goes whooping across the room chasing the cat, a stick in the waistband of his pants for a pistol or knife, thus putting into practice the lesson he has learned and which will develop him by and by into the wild and woolly would-be-horned cowboy."

As Mr. James very fairly argues the point on behalf of his comrades, it is the custom, whenever a disturbance occurs in a Texan or Kansas town, to describe the noisy creatures as cowboys, whereas it frequently happens that the disturbers of the peace have never seen a ranch at all. Men of the caliber frequently spoken of as cowboys would find the atmosphere so torrid on a ranch, or in a camp, that they would not remain in it many minutes, even if they ever possessed the temerity to visit it all. As to the genuine cowboy, Mr. James' definition is so practical and so full of quiet humor, such as is frequently heard around the camp-fire or on the trail, as well as being so commendably brief, that we reproduce it in full.

"The title 'cowboy' is not intended to apply to all men who have taken an active part in handling cattle, but to those only who have proven themselves worthy the name of genuine, because of the nobility of character they possess; neither do I wish it understood that I am thus assuming that the genuine cowboy is altogether faultless. Even the genuine is human, and possessed of all the characteristics of frail, erring mortality. But one thing I do claim for him is, that in view of his peculiar surroundings, temptations, associations and privations, he is an exceptional character in that he is possessed of qualities both useful and ornamental in any station of life; but especially so with him, isolated as he has formerly been from the refining influences of civilization. In reality the cowboy might properly be divided into three classes. First, No. 1, the genuine, because of his true manhood, and not only in his relationship to those with whom he is daily associated in handling cattle, but with all the world. One who has as much respect for the rights, though he be miles away, as for his immediate neighbors. I mean by that a man who is strictly honest, one whom it does not affect in his general health to eat a piece of an animal of his own mark and brand. Still, one who is not so Pharisaical as to 'thank God, he is not as other men,' but can throw the mantle of charity sufficiently far as to reach his less scrupulous brother; and one who will look to the interest of his neighbor, when on a round-up, as he does his own, no difference what the reputation of that neighbor may be. One who is the happy possessor of the combined characteristics of a true gentleman, a loyal citizen and an all-round business man, with the 'get-up-and-get' of a cowboy.

"No. *2* is worth consideration. He is the true type of Western hospitality, liberal to a fault, especially in his moral views; so much so that his conscience is possessed of such elasticity as to serve him in any emergency. Like the proverbial Irishman, who, upon finding a U. S. blanket, called out: 'U for Patrick and [illegible]or McCarthy. Och, but I'm glad I found me blanket. Me father told me that edecation was a good thing, and now I know it; but for an edecation I never would have found me blanket.' So it was with No. *2*; he is peculiarly fortunate in his education. It often assists him in his interpretation of the brands of cattle from the Northern range, and enables him to appropriate the same. He is thus financially reimbursed for his losses during winter's driving storms; he is, however, peculiarly constituted when it comes to eating an animal encumbered with his own mark and brand. It is almost a dead shot. If by any misfortune while he is in a distant range some enterprising No. *2* should feed him on some of his own beef, it acts like ipecac. In his own language, 'It shore makes him sick,' so I have heard them say; and such a thing as eating their own is so rare, if they should find it out it

seems not unlikely that the thought of such would cause a reaction in the physical man. It never proves fatal, however, as it is part of his existence to get even.

"No. 3 is the roaming, 'come day, go day, God send Sunday, good-natured, easy-going cowboy,' who is just as happy where he is as where he is not; who cares for nothing but a good saddle, spurs and quirt and a forty-dollar job; who seldom aspires to accumulate for himself, but is satisfied to spend his life in working for some one else, and when the season for working cattle is over repairs to the nearest town and spends what he has earned in having a good time. No. *2* manipulates this latter class in many ways; they, as a rule, will do for him what they would fear to do for themselves, and too often it is the case that No. *2*, when in too close a place, in order to save himself, will slip the head of some pliable dupe into the halter that justice has designed for his own. Don't understand by this that I mean to intimate that No. *2* is a thief. No, indeed; if any one should accuse him of such conduct it wouldn't even ruffle his feelings, as he lives daily in the consciousness that everything he does is on the dead square. No. *2* is simply a 'rustler' from 'way back, and when it comes to a round-up, he's there.

A BUNCH OF WELL-KNOWN COWMEN.

"I have given the shady side of character No. *2*, and I am glad to give you his virtues, and don't wish you to think that I am partial in what I shall say of the sunny side of his life. No. 1 needs no coloring or apology, as his life is a living index to his character; No. *2* needs the mantle of charity very extensively thrown around his wayward shoulders, and it is but just when we consider his environments, the peculiar circumstances under which he has been trained, it is but charity to give him credit for the good in his nature. No. *2*, with some exceptions, is a neighbor to be proud of; he has nothing too good to divide; you know when you enter his home that you are welcome. There is an air of freedom that one can feel sensibly pervading the home of No. *2* that inaudibly, but positively, breathes a hearty welcome. You needn't expect him to neglect any of his duties to entertain you, for he will not, but you have the freedom of the place, let it be large or small.

"He will ride twenty miles on a rainy night to bring the doctor for a sick neighbor, or go to the relief of a distressed human being, no difference what his character. All he needs to know is, that they are suffering. If any of his associates, those with whom he 'stands in,' should be so far misunderstood

as to get arrested, he will go to his rescue, and, as a rule, is able to make satisfactory explanation and secure a verdict. This especially applies to dates back of '87. It is now getting to a point, and has been for several years, that jurists and judges are getting so incredulous that the boys have been having considerable trouble to explain their mistakes, and the consequence is that many of them have been sent East to work under the supervision of the State; this is invariably done under protest, and nearly every one who takes a State contract is innocent; and if you don't believe it, you may be convinced by going to Rusk, Tex., and ask them or refer to the court records, and almost without exception, you will find a plea of 'not guilty.' A genuine No. *2* never goes back on a friend.

"If some unfortunate should come to him in distress, one who is in danger of being 'pulled' for 'pulling,' he will 'rustle' up the best stray horse in the range, and borrow a saddle from a sheep man, provided the 'snoozer' is away, and filling him up on good grub, will give him some of his spare cash and let him 'lean forward and shove,' after giving him some meeting-house advice, which, as a matter of course, he takes. No. *2* will guard the interests of his neighbors in the cattle business, and also his stand-bys with jealous care. When he finds cattle in a distant ranch belonging to neighbors, even though it is a poor neighbor, he will drive them for him; and even a nester, if he is a straight man, receives the careful consideration of No. *2*, often having the free use of milch cows the year round. In fact, if No. *2* allows him to milk them at all, it is free, the only consideration being that the calves are cared for and not knocked on the head with a churn dasher, to prevent which, he usually requires the nester to milk half a dozen or more.

"No. *3*, on the other hand, sometimes by close application to business, especially if he is a live and energetic rustler, will accumulate sufficient property to take his place in the rank of ranchmen. Those who did not accumulate and start in cattle, eventually married, and either settled down to engage in grangering, become nesters or take a contract from the State.

There are other characters in the cattle business, but the three classes mentioned include the principal actors in active cattle raising. The cowboy is a big-hearted, whole-souled bundle of humanity, kind-hearted, generous to a fault, possessed of all the frailties common to mankind, and not the biggest rascal on earth by a jug-full."

Mr. McCoy's description of the typical cowboy and his life was written years prior to the very eloquent, and almost touching, defense just quoted. The pioneer shipper of Western cattle has this to say of the cowboy of the sixties and seventies:

"If any one imagines that the life of a cowboy or ranchman is one of ease and luxury, or his diet a feast of fat things, a brief trial will dispel the illusion, as is mist by the sunshine. True, his life is one of more or less excitement and adventure, and much of it is spent in the saddle, yet it is a hard life and his daily fare will never give you the gout. Corn bread, mast-fed bacon and coffee constitute nine-tenths of their diet; occasionally they have fresh beef, and less often they have vegetables of any description. They do their own cooking in the rudest and fewest possible vessels, often not having a single plate or knife and fork other than their pocket-knife, but gather around the camp kettle in true Indian style, and, with a piece of bread in one hand, proceed to fish up a piece of 'sow belly' and dine sumptuously, not forgetting to stow away one or more quarts of the strongest coffee imaginable, without sugar or cream. Indeed, you would hesitate, if judging it from appearance, whether to call it coffee or ink. Of all the vegetables, onions or potatoes are the most desired and the oftenest used, when anything more than the 'old regulation' is had. Instead of an oven, fire-place or cooking stove, a rude hole is dug in the ground and the fire made therein, and the coffee-pot, the camp kettle and the skillet are the only culinary articles used. The life of the cowboy is one of considerable daily danger and excitement. It is hard and full of exposure, but is wild and free, and the young man who has long been a cowboy has but little taste for any other occupation. He lives hard, works hard, has but few comforts and fewer necessities. He has but little, if any, taste for reading. He enjoys a coarse, practical joke, or a smutty story; loves danger, but abhors labor of the common kind; never tires of riding, never wants to walk, no matter how short the distance he desires to go. He would rather fight with pistols than pray; loves tobacco, liquor and women better than any other trinity. His life borders nearly upon that of an Indian. If he reads anything, it is in most cases a blood-and-thunder story of the sensational style. He enjoys his pipe, and relishes a practical joke on his comrades, or a

tale where abounds animal propensity. His clothes are few and substantial, scarce in number, and often of the gaudy pattern. The 'sombrero' and large spurs are inevitable accompaniments. Every house that has the appearance of lack of convenience and comfort, but the most rude and primitive modes of life, seem to be satisfactory to the cowboy. His wages range from fifteen dollars and twenty dollars a month in specie. Mexicans can be employed for about twelve dollars per month. The cowboy has few wants and fewer necessities, the principal one being a full supply of tobacco.

"We will here say for the benefit of our Northern readers that the term 'ranch' is used in the Southwest instead of 'farm,' the ordinary laborer is termed a 'cowboy,' the horse used a 'cowhorse' and the herd of horses a 'cavvie yard.' The fame of Texas as a stock-growing country went abroad in the land, and soon after her admission to the Union unto her was turned the eyes of many young men born and reared in the older Southern States, who were poor in this world's goods, but were ambitious to make for themselves a home and a fortune. Many of this class went to Texas, then a new and comparatively thin and unsettled country, and began in humblest manner, perhaps for nominal wages, to lay the foundation for future wealth and success."

Read side by side, these two little essays on the genus cowboy teach a lesson in the process of evolution which has been so marked in every section of the live-stock interest of Texas and the Southwest. Mr. McCoy is a little unnecessarily severe on the cowboy. We doubt very much whether this gentleman, for the cowboy may be, and generally is, a gentleman, was quite such a rough-and-tumble, uncouth individual, even thirty years ago, as the justly respected pioneer cattleman would have us believe. That the desire among cowboys for reading is very limited is not true at the present time, because there are on the Texas plains an immense number of well-educated men engaged in the cattle business. It is no doubt that during the war an exceedingly unsatisfactory class of individuals went out on the plains for the purpose nominally of herding, but actually of stealing and generally making things unpleasant for all with whom they came in contact. There may have been among these a large number who enjoyed costly practical jokes and objectionable stories, who abhorred hard labor of the common kind, and loved tobacco, liquor and women better than any other trinity. There may have been some among them who enjoyed a corrupt tale where abounded much vulgarity, and there doubtless were several whose clothes were coarse and gaudy.

But Mr. McCoy falls into the error of allowing the sins of the few to rest upon the shoulders of the many. Many men who to-day are prominent in the cattle trade were cowboys in one sense of the term, and none of these ever came within the definition so abruptly and severely applied. Mr. McCoy's cattle book is one of the first which was ever published concerning the trade, and, generally speaking, it is taken as a classic. This being so, it is the more to be regretted that in writing up the cowboy he dwelled so extensively and seriously upon the bad features of the few, without softening his criticism by an equally fair statement concerning the virtues of the many.

Mr. James handles the subject very differently. A writer is, to a great extent, a recorder of public sentiment. If he is successful it is because his writings are, more or less, a mirror faithfully depicting current thought as well as current events. Hence it is the description of a cowboy printed in 1893 is so much more reasonable than the definition placed on record twenty years previously. There has been an immense improvement in the morals and the personnel of the average cowboy during the last quarter of the century; and even if Mr. James writes from a prejudiced standpoint, and hence brings to the front the nobler side of the cowboy's character with possibly undue force, he does not overstate the case when he claims for him that, "in view of his peculiar surroundings, temptations, associations and privations, he is of an exceptional character, in that he is possessed of qualities both useful and ornamental in any station of life; but especially so with him, isolated as he has formerly been from the refining influences of civilization." Certain it is that the description of Mr. James fits the cowboy of the last ten years of the nineteenth century far better than the description which, we hope, was scarcely accurate when written, and which certainly does not apply in any way to ninety-nine per cent of those now engaged in raising and feeding stock.

One thing is certain about the fin-de-siecle cowboy. He is undoubtedly the good Samaritan in the parable which was designed to hold up for commendation the most noble attribute of human nature. A Pharisee the true cowboy never is. If, perchance, a man imbued with the holier-than-thou idea

wanders into Texas, and attempts to earn a living on a ranch, things are made so unpleasant for him, and so many practical jokes are played upon his person and his belongings, that he loses no time in shaking the dust of the great cattle State, and returning in haste to the place wherefrom he started.

But the cowboy is more than a good Samaritan. We do not read in the Bible that, in relieving the sufferings of the man who had fallen among thieves, the Samaritan parted with anything in which he was not actually in need. The cowboy is not only generous when generosity costs him nothing, but he is generous when generosity involves actual personal hardship. Instances can be recorded, time without number, of cowboys who, while engaged in their arduous work, have parted with common necessities of life, and suffered great privations in order to let a weaker brother have a little more luxury. Life on the plains of old, and even on the ranch of to-day, has little place in it for sick people, but the cowboy who is hurt while at his work, or who falls sick, finds out for the first time the true extent of his circle of friends. Men who may have joked and teased him while he was well, and even been jealous of his superior horsemanship, or of his ability to attract the attention of the fairest members of the fairest sex, vie with each other in their efforts to relieve his sufferings and provide for his needs. When a cowboy "hands in his checks," to use an expression often heard in the Southwest, there is more grief among the apparently hardened survivors than is often found in the most civilized State.

One little incident illustrative of this noble feature so conspicuous in the cowboy may be given. For obvious reasons names are omitted. The story was told the writer by a gentleman who has been connected with the cattle trade since he first toddled after his father, who was a cattleman ten years before the war broke out. There had been a stampede of cattle during the night, not a very unusual or remarkable occurrence, but this time it resulted fatally to an exceptionally bold and, indeed, reckless rider, who had tried to turn the leaders from their course and convert the wild rush into a galop around a circle. The scene, as described by an eye-witness, was a thrilling one in the extreme. The herd first commenced drifting rapidly before a norther, which became greater in strength and force every second. Suddenly it began to rain very heavily, and a magnificent, though awful, thunder storm succeeded, the lightning being vivid in the extreme and the thunder deafening in tone and volume.

There was no doubt now as to what would happen. The cattle lost their heads and commenced to stampede in the wildest manner. A dozen expert riders, in whose vocabulary there was no such word as fear, made an effort to turn the herd. The easiest and safest course for them to have adopted would naturally have been to keep out of the way of the cattle, and let them go where they would; but duty suggested another course, and the ordinary though perilous task of turning the herd commenced. To get in front of stampeding cattle is merely to court instant death, and all that can be done is to ride by the side of the leaders and endeavor to divert them from the straight line which in their frenzy they have adopted. In this particular case the task was unusually difficult, owing to the roughness of the ground and the wildness of the cattle, many of which had only been added to the herd a few days before. One man, in his effort to protect his employers' interests, met with a not unusual, though fortunately a less frequent fate than was at one time the case. His pony cannoned heavily with a wild steer and fell. Its rider, who had been astride a thrown pony a score of times, sprang safely from the back of his falling steed, and was in no danger from this immediate accident; but before he could recover himself he was knocked down, trampled under foot, and left behind the stampede a broken and bruised mass of human flesh and bones. By one of those uncertainties of fate which mankind cannot explain, the immediate death which his companions felt was the inevitable did not ensue, and a few hours later the dying man was lying on a small couch in a friendly shanty. His condition was hopeless, and all that was to be done was to make his few remaining moments of life as comfortable as possible. Suddenly consciousness returned to the sufferer, who, raising his voice as much as his strength would permit, said to the ten or twelve members of the much-maligned profession of Texas cowboy who were standing around him:

"Boys, which of you will take care of my children?"

Not one of the crowd knew that their comrade was a man of family, but every hand was raised instantly, and with a smile the injured man passed out of existence, conscious at the last moment of his life that the promise made by his comrades would be faithfully performed and fulfilled to the letter.

The sequel of this story is, that as soon as the family of the dead man could be located, the boys who had given the pledge made arrangements to provide for the education of the two little children who survived their cowboy father. Others, hearing of the circumstance, insisted on being allowed to help, and the children in consequence received an excellent education, and have quite recently been given a first-class start in life.

This anecdote is given here as a prelude to an attempt to show that whatever peculiarities the cowboy may have, he is at heart a splendid fellow, and that his word is better than the bond of the average man who looks upon him with contempt, and who often speaks of him in terms of ridicule and ill-concealed scorn.

AN OUTFIT

Speaking of the peculiarities of the cowboy, one naturally refers to his clothing, and more especially to his hat, boots, saddle and bridle. We have already spoken of the exaggerated idea in some portions of the East as to the style of clothing in those sections of the country where cattle raising is an important industry. A very large number of cowboys at the present time dress just about as they please, wearing as little as possible in summer and wrapping up very indifferently in winter. In years gone by the fashions as to cowboy clothing were undoubtedly very arbitrary. Before the war there was a great variety in the outfit, and there was some excuse for speaking of the cowboy as a walking arsenal, because his frequent interchange of civilities with the "noble red men," and with wolves and other animals, made it necessary for him to go about very freely armed. It was during the war, or shortly after its close, that the first general attempt at anything like uniformity was observed.

Money was not very plentiful in those days anywhere, and especially on the plains, and hence it took a good many months' savings to get in the fashion. A very narrow stirrup was affected at that period and the toe-fender first came into use. The substantial Mexican saddle, which has since become so popular, was then quite a rarity. There were some very large and good saddles, but the majority of them were sadly lacking in requirements for the comfort and safety of the rider. The very costly and elaborate bridle of to-day was then unknown, and in its place were strips of rawhide, tanned as well as could be, arranged without the usual facilities for a scientific manufacture of leather. Home-made clothing was the rule at this period. Instead of the characteristic hat of to-day, home-made straw was generally favored; and, in order to protect the clothing from the tremendous wear and tear of constant life in the saddle, leggings of calf-skin, with the hair on the outside, were made by those members of the fraternity who had time and patience to devote to the work. Speaking of this period, Mr. W. S. James says that some men broke the monotony by making their bridles out of hair on the Mexican plan, while others plaited thin strips of rawhide and used them for the purpose. The ropes used for catching and handling cattle were mostly plaited rawhide of this character; and it is the opinion of a good many modern cattlemen that the ropes thus made have never been equaled in pliability and strength.

In the seventies there was a general change in style. The wool hat came into use and was found so infinitely preferable to a straw, that not to wear one was to be away behind the times. Leather leggings and handsome bridles also came to the front, and, what was more important, the old narrow stirrup, in which a man could do a little more than thrust his toes, gave way to a wide stirrup very much like the one now in use, although it was sometimes an inch or two broader. It is strange to say that at this period what is known as the English style of riding began to be popular. Instead of riding in what is now known as the conventional cowboy style, with the knees straight, the stirrup leathers were shortened four or five inches, and even more, so that the plan of riding with the legs cramped and the knees always bent became general. A flat horned saddle, much broader than formerly, also came into use. The saddle pocket of gaudy pattern was another invention, and another difference in style was a saddle high up in the neighborhood of the horn and very low in the rear, so much so that the tenderfoot invariably slipped off the hind end the moment he tried his horsemanship on the back of a cow pony. Long buckskin gloves and gauntlets, passing up above the elbow, also became fashionable. Larger stirrups, fitted with bows and tassels, also came into use, and the cowboy became quite picturesque as well as conspicuous individually.

Again did the fashion change. Heavier-made, square-toed boots came into use, and the very heavy saddle, still popular, came into prominence. During the last ten or twelve years exaggeration has been largely abandoned, and although the cowboy's dress is still attractive and a little peculiar, it is not a little conspicuous or gaudy, whatever may be said to the contrary. Nor does he now think it necessary to wear a number of pistols or knives in his belt, and otherwise proclaim to the world that while he is not exactly hunting trouble, he is quite prepared to be strictly in it if any one treads on the tail of his coat.

It is often said that the cowboy is cruel. Some portions of his work necessitate a good deal of roughness, but at heart he is as merciful as the average human being, and often more so. To break in a pony by kind words is excellent in theory, but when a cowboy finds himself on a balky animal ready, willing and able to throw and injure him, it is, to use the words of President Cleveland, "a condition and not a theory which confronts him." The plucky little pony has to be taught once and for all who has got the final say-so in the matter, and, to the credit of the average pony's intelligence be it said, this lesson seldom has to be taught twice. When once an understanding has been come to between rider and steed a genuine friendship is struck up, and the rights of the pony are protected by its owner as zealously and, indeed, jealously as his own.

Next to his love for his pony, it is possible that the cowboy loves his saddle and bridle best. Cases are on record of men who have deprived themselves of little luxuries in the way of tobacco, etc., for several years or, at any rate, months, in order to secure a saddle and bridle worth as much as its owner could earn in six months. These saddles and bridles, and also bits, are kept in a condition of

elegance which would shame the best educated and trained army in any Eastern city; and a man who spoils or injures one of these personal belongings, generally has considerable reason for regretting the fact.

The cowboy also has a tendency to collect a first-class outfit of ropes. Some men have eight or ten first-class hopples always on hand, and those they protect with an amount of care that can hardly be imagined unless a man is on the ground to watch the cattle events of prairies and ranch life. The old joke about the cowboy with a two-dollar suit and an eighteen-dollar hat has been repeated again and again, but although it may be a little overdrawn, it covers the point to a certain extent. Instances are not uncommon of cowboys whose clothing would scarcely be purchased for a few cents by a second-hand dealer, but whose hats, saddles, bridles and spurs are as nearly perfect as money could procure. Mr. James estimates that the average hat worn by the fashionable worker on a ranch costs him between five and ten dollars. His clothing he estimates at about the same, and also points out that extravagance and an absolute inability to save a dollar as one of the natural results of life on the open prairie.

Under these conditions it is interesting to observe that there is very little money to be made in tending cattle. Things of course are a great deal better than they were in Mr. McCoy's time, but the wages paid for ranch work may be fairly estimated as varying between fifteen and seventy-five dollars a month, with a good many more receiving the minimum than the maximum. When it is remembered that a first-class saddle costs about one hundred dollars, and that a good many men spend as much as twenty-five dollars for silver medals on their hats, it is not difficult to realize that nothing is saved in many instances after ten or twenty years' work of this character. Of course, there are countless exceptions to the rule. Some cowboys are allowed to own a few cattle which run with those of their employers, and in this way many a foundation has been laid for successful and very prosperous ranch work.

It is often asked why it is that cowboy life has so many attractions. No one who knows anything about the boys believes that it is a life of luxury, and we can easily see from the figures quoted above, that there is very little money in it. The absence of comfort in the life can scarcely be overestimated, and it is probably the by-play and practical joke phase which commends it to so many. Almost every day something transpires to make a diversion possible from the stern realities of life. The appearance of a stranger in camp is almost always an excuse for a little fun, and although the jokes are often carried too far, they are seldom very serious in nature. A trick, which never seems to lose the force of its interest by age, is to persuade a new hand to mount an unruly horse. The circus which follows casts into shade the best tricks ever seen in a tented ring. Sometimes the stranger shows an ability to retain his seat under difficulties, and then the delight of the cowboys know no bounds. The joke is turned against them for a moment, but they enjoy it none the less, and the man who has thus proved his horsemanship ability is admitted into good-fellowship without more ado.

The jokes that have been sometimes carried to considerable length is shown by some of the stories which every one hears while in Texas. At a comparative recent date, a young man from the East, who had determined to become a cowboy, sought employment on a large ranch in the southwestern portion of the State. He was dressed something like the two journalists referred to in the opening page of this chapter, and when he reached the camp his extraordinary garb caused the boys a good deal of amusement. By common consent it was decided to humor the new-comer. He was greeted with fervor, and before he had been in the camp a half hour his head had been swelled several sizes by the assurances he had received that he was just the kind of man they had been looking for. Such portions of his outfit as pleased the fancy of the boys, as they crowded around the new-comer and listened with well-simulated admiration to the ridiculous stories which he told them with great delight, were appropriated or borrowed.

Finally, one member of the party, a habitual practical joker, who never hesitated to carry into execution any desperate idea which commended itself to him, left the circle and disappeared. About an hour later he arrived with a deputy sheriff, who promptly arrested the would-be bad man from the East. The young man, who had been doing his best for two hours to persuade his newly-found companions that he had killed men several times, and that he had been guilty of almost every offense against the law of the land, fell on his knees at once, and assured the deputy sheriff that he had done

nothing and his arrest was a mistake. The practical joker had informed the deputy sheriff that the new-comer was a member of a gang of train robbers, for whose apprehension a liberal reward was offered. The deputy sheriff told the would-be cowboy to get up and shut up, and he was dragged away under arrest and held to answer a charge of which he was as guiltless as an infant in long clothes. Of course, the mistake was discovered almost immediately, and the young man was set at liberty, but he had had enough of Texas life on the plains, and returned home a wiser man to his friends. Just what was his explanation of his speedy return is not known, but he must have found it very difficult to reconcile results with anticipations as previously announced.

It is often said that cowboys put in a great deal of their time riding through peaceful towns and settlements, firing their six-shooters right and left, and driving people into a condition of collapse from fright. This is one of the misapprehensions of the age. In border and mushroom-grown towns there is always more or less lawlessness, and, occasionally, cowboys partake in exuberations of excitement, and have what is called a good time in rather a bad way. The court and police records of cattle States and Territories show, however, that the percentage of cowboys among criminals and even lawbreakers is very small indeed. A cattle thief is not a cowboy, and the greatest possible injustice is committed when the two types of men are confounded; nor is the man who recklessly fires his revolver into a crowd or a train necessarily connected with the cattle trade, even though he lives in a district where a large number of steers are fed.

"I never knew but one outfit in Texas," says Mr. James, "that would have hired or kept a man on a ranch who would fire into a train. I don't believe that one out of every five hundred of the cowboys who have figured in cattle in Texas would do such a thing. They have more personal respect, and, as a rule, they have too much respect for women to do anything that would frighten them or endanger their precious lives. The cowboy is a bundle of fun, but pure, unadulterated cussedness is not one of the ingredients in his composition. He is rollicky, but not mean. You may say what you please about your Eastern civilization, and I grant in some localities you are far in advance of Texas in some things. But, remember, I am now talking of the cowboy, and I have witnessed things in some of your Eastern cities and towns that I never saw, and that would never occur, in any Western town in Texas. I mean incivilities to ladies, or what I, with my unvarnished ideas, would call uncivil treatment."

The same writer gives an interesting description of the peculiar slang expresssions which are current on the ranch. Mr. James very properly points out some very popular preachers who are very free in their use of slang expressions, so that if occasionally the cattleman deviates from pure Lindley Murray, it is not very surprising. He recounts the fact, which is generally known, that if a cowboy swears in the presence of a lady, he is certain to be handled very roughly in the way of punishment, or, if he is not, he is sure to be very roundly cursed for allowing himself to fail in breach of good manners.

"Something seldom," is a very common slang expression in Texas, and Mr. James explains how this came to be adopted. "A number of the boys," he writes, "were one day standing on the corner of a street in a Western town, when a little black dog came trotting across the public square. They were making some very unkind remarks about the dog, as he had no tail and his ears were cut off. An old drunken fellow, standing holding to a sign-post, took in the situation and, in his half-drunken, foolish way, said: 'Something seldom about that little black pup.' This created quite a deal of mirth; the boys took it up from that, and to-day there is not an expression more universally in use in the West among the boys than this one, 'Something seldom,' and the variety of uses to which this expression is subject is something curious. For instance, if one sees a very fat horse, 'there is something seldom about that fat horse'; if very poor, 'there is something seldom about him'; if very large or small, it is the same. If a young lady is handsome, 'something seldom about that girl'; if very homely, still 'something seldom.' It is applied to tall people, short people, fat people, thin people, good horses, bad horses, one-eyed people, cross-eyed people, fast horses, fine cattle, scrubby cattle, good preachers, bad preachers—anything and anybody under any and all circumstances conceivable; there is 'something seldom' about them."

Many of the slang expressions are simply a result of regarding a man, for the time being, as one of the herd. Hence, when a man is out of sorts, it is sometimes said that he looks so bad that his ears

flop. "I've got your company," is a common way of acquiescing to a proposition, and there are dozens of other similar expressions which, if space permitted, might be given. Repartee is common. One instance is recorded of a man who went into a camp limping badly, and complaining that he had been bitten by a snake. Snake bites are comparatively common among herders of cattle, and the wag of the camp asked, mechanically: "Did it hurt the snake?" Every one laughed, and the victim of both bite and joke hopped off to prevent subsequent injuries by means of a liberal dose of that specific for snake bites in the West and Southwest—whisky.

Mr. James, who appears to have studied cowboy life more closely than any other writer, tells another story about a cowboy named Joe, who once purchased an exceptionally handsome silver-plated pipe. Everything is common property on a ranch. Full-dress suits are not in vogue, but if a cowboy receives an invitation to a hop, and he has no clothing suitable for the occasion, he generally goes through the wardrobes of his companions and takes the nearest thing he can find to a full-dress outfit from among them. If he thinks about it he will return the articles the following day, but generally speaking, they lie around until the owner comes after them.

On this particular occasion, Joe, on returning to camp with his purchase, told the boys that the pipe was for him, and that if any one was caught with it, the individual who is supposed to have charge of the lower regions would have to pay in consequence. For awhile the dictum of the pipe owner was respected, but one day the orders were disregarded and a member of the camp not only smoked from the pipe, but also put it in his pocket in order to be able to repeat the process later on. The next morning the pipe borrower found, to his astonishment, that his pony was missing, and he had to go to work on a very unsatisfactory animal, which had been laid to one side on account of its lack of speed and general meanness. One fine morning he was smoking the appropriated pipe and talking about the horse, when one of the crowd looked up and asked if that wasn't Joe's pipe. The man said that it was, whereupon his questioner told him that it was about twenty to one that Joe knew where the horse was. The hint was taken, the pipe restored to its owner, and sure enough within an hour the pony was back in its usual quarters.

But it must not be supposed that even a large percentage of the time on the ranch is spent in the perpetration of jokes and having a good time. The routine of a cowboy's life to-day is monotonous compared to what it was in the free-range days, when the scope of his operations varied materially. Mr. McCoy, whom we have already quoted as a little severe in his criticism of cowboys, gives a description of one of his duties which shows that at the time that gentleman wrote his criticisms the time at the disposal of the cowboy for fun was very limited. An account is given of the steps taken by a drover who had arranged to collect a large number of cattle and drive them to the North. When the drover had completed his contracts, he purchased the necessary saddle horses, got up what was called a cavvie yard, a wagon for hauling camp supplies, the requisite number of cowboys for driving, and further facilities for providing for them on the road.

"When the day for receiving his purchases arrives," writes Mr. McCoy, "the drover, with his outfit of hands and camp equipage, puts in an appearance at the designated place, and all such cattle as will fill the contract are received; and often many that do not fill the contract are taken, simply because a custom has obtained to take almost everything the ranchman has gathered, and a drover who will not do so is termed very particular and liberal—a reputation that they abhor—so, thus often the drover is pulled into taking animals that he never bought and that his business sense tells him he should not take. And this is the reason, more than anything else, why so few really select droves of Texan cattle reach the Western market. It is no lack of judgment, but because it is the custom to take almost anything that is gathered by the ranchman. Again, these contracts are usually verbal only; and to be particular, would lead to wrangles and differences of memory and understanding, which are not pleasant to the drover. The ranchman is gathering the stock to fill his contract, drives together, or, in drover parlance, 'rounds up,' a large number of cattle of all ages and sexes, and while from six to ten cowboys hold the herd together the ranchman, with one or two assistants, separate such as are suitable. The process is termed 'cutting out.'

"The process of 'cutting out' is one that requires skill and expert horsemanship, both of which the experienced cowboy invariably possesses in a high degree, especially the latter, for, indeed, it is a

desperately bad cow pony that he can not ride. This reputation of Texas for horsemanship is national, and needs no eulogiums in this place. To accomplish the greatest amount of labor with the least effort and the least amount of hard riding, two cowboys work together. When a beef is selected to be 'cut out' he is adroitly and quietly maneuvered to the outskirts of the round-up, and when the opportune moment occurs the cowboys dash at him, and, before he is aware of it, is on the outside of and separated from the herd; but no sooner does he discover the situation than he makes a desperate effort to regain his comrades, and just here is where the skill of the cowboy is put in requisition. While one rides beside the steer the other rides just behind him, to prevent or check any sudden change of direction that the frantically excited bovine may chose to make in his efforts to get back with the herd, which he tries desperately to do, and persists in trying so long as there is a shadow of a chance to outrun his pursuers. Often the race is close and the contest exciting, and sometimes the outer circle of the round-up will be run more than once before the beef will be induced to abandon the effort to get into the herd.

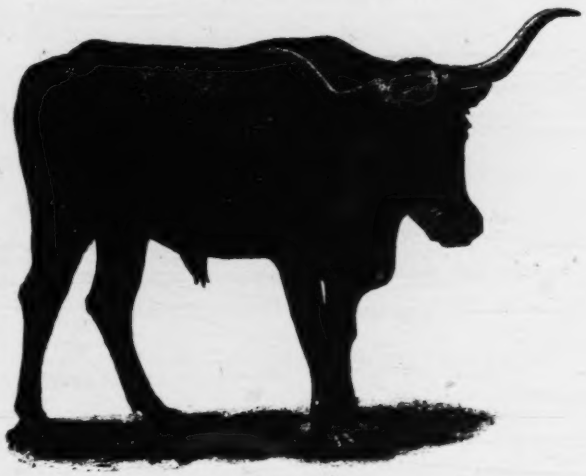
"But when he finds himself outrun and outgeneraled, he will toss up his head and look for the comrades which have been previously cut out, and are being held a few hundred feet distant. In the beginning of the cut-out, a few gentle cows or working oxen are driven a short space from the round-up and held, to form a nucleus, to which those cut-out gather. Cutting-out is always done on an open, smooth spot of prairie, and never done inside a corral, as a Northern man handles or separates his cattle. When North with their herds, a Texas drover always prefers the prairie to any inclosure to handle his stock, for there, mounted on his pony, he feels at home and knows just how to manage; besides, he has a fixed, constitutional prejudice against doing anything on foot that can possibly be done on horseback, not to speak of the almost universal fear they entertain of being among their stock on foot. They are justified, to some extent at least, in indulging this wholesome fear; for but few Texan bullocks will hesitate, when enclosed alone in a strong corral, to show decided belligerent proclivities, or to furiously charge the venturesome wight who dares to show himself on foot within the enclosure. Occasionally, whilst loading a herd upon cars, a bullock will become detached from his comrades, and almost invariably, as soon as he finds himself alone, without ability to escape, will manifest a disposition to fight anything or anybody that may chance to be in sight. Often considerable difficulty is experienced in getting him to any desired place. A Northern man, unaccustomed to handling Texas cattle, will often rush into the corral wherein is a single bullock. He will have scarcely got cleverly in the corral before the bullock, with arched back, down-set head, extended nostrils and glaring, fiery eyes, darts toward his supposed adversary, who, suddenly taking in his dangerous situation, but too late to retreat by the way of his entree, rushes post haste to the nearest fence, which is usually so high he cannot spring to the top of it; but reaching the top with only his finger tips, draws his body as high as possible, and clinging to his hold with frantic grip, yells lustily for help."

An immense number of descriptions of camp life and scenes at a modern round-up have been published from time by tourists and amateurs. One of the best of these was written by a well-known New York man for "FRANK LESLIE'S MAGAZINE" about three years ago. This description is so vivid that we reproduce a portion of it in the writer's own words. After explaining that he had arrived the night before with his friend, the owner of the ranch, and had hence not seen the surroundings in daylight, he describes his sensations when, at about three o'clock in the morning, he was suddenly aroused from very pleasant dreams by a furious banging on a tin pan, and a shout of "breakfast." It was but 3:30, and only the faintest glimmerings over the high, white bluffs on the opposite side of the river, showed where the sun would rise by the time the bustling camp had breakfasted and was ready to begin the long day's work. Right in front, next the river, was the huge camp-fire of logs on which the breakfast for thirty-five men was smoking, and the men themselves, the cowboys about whom he had been dreaming for months, were either warming and stretching themselves around it, or taking a hasty bath in the stream.

Just at this moment the cook, a huge Texas darky, sententiously remarked, that if that particular crowd wanted anything to eat they had better "hustle round right smart." His friend handed him a plate and cup from the mess-wagon standing near, and he helped himself from the steaming pots and kettles round the fire. Probably the fried steak, hot biscuit and black coffee straight would not have

been relished so much on one's breakfast table at home, but in that bracing air one is almost like the Indians, who are said to usually eat anything they can bite. The New Yorker was not so much occupied with the meal, however, but that he could look around him at his companions. Ever since, as a small boy, he had read of the wonderful adventures of the "wild cowboys of the plains," he had had the greatest curiosity to meet them. And now, with more than thirty genuine specimens, almost touching them, he felt none of the awe-struck sensations he had always thought the occasion would warrant. They were for the most part young men, some apparently little more than boys. But the bronzed faces and wiry, athletic figures, told of months of the most active life in the open air, and there was something in the keen eyes and easy carriage which showed that there was that in them which made their calling the synonym of daring recklessness.

A few were regarding him curiously, but there was little said. All were trying to eat their breakfast in the shortest possible time, and talking quietly about the day's work. It had been gradually growing lighter, and all at once the sun rose out from the white cliffs, lighting up the strangest and most beautiful picture he ever saw. Just across the blue river the white bluffs showed where the desert, an unbroken expanse of rugged "bad lands" and alkali plains, stretched away for fifty miles to the Wind River Mountains, whose immense snow-clad peaks rose clear and distinct, seemingly not ten miles distant. Back of them was the soft gray of the broken foothills, and everywhere the creamy-white rocks which the sun had painted with every imaginable shade of rose color. The bright green meadow where we were encamped had scattered over it clumps of cottonwood and willows, making it, in comparison with the, to him, universal desolation around it, a veritable oasis.



AN ORIGINAL TEXAS STEER.

The tinkle of the bells in the distance startled him, and it needed not the quick movements of the men, as they hastily swallowed the last of their coffee and began overhauling riding rigs, buckling on revolvers and coiling up rawhide "riatas" or lassos, to convince him that the real work of the day was about to begin. Their preparations were hardly completed before down from a canyon came rushing the saddle horses, more than three hundred in number, with a great clanging of cow-bells and cracking of long whips by the "horse-wranglers," who all night long had been guarding them as they grazed in the hills.

Now the quiet, determined-looking man pointed out as the foreman made his presence felt, and in a moment horses were rounded up on the flat, the men assigned their mounts for the day, and everything was bustle and confusion. But a short time sufficed for roping the animals from the herd and cinching on of saddles, though not without many angry snorts and emphatic protests from the wilder ones. At a few quick directions from the foreman two of the men sprang to their saddles and started for the hills at a long, swinging gallop. Others follow, scattering out to sweep the entire district to be worked.

The New Yorker had been provided with a powerful bay, whose splendid limbs, heavy muscles and clear-cut, intelligent head showed the points that made his sire famous as a steeple-chaser on many a noted Eastern race-course. His companion for the day was a tall, handsome young Californian, who stood holding a wild-eyed, nervous black, that evidently had not seen many days' hard riding since he was roaming over the hills at his own sweet will. Only asking if he was ready, the "vaquero," one hand on the pommel and disdaining stirrups, sprang to the saddle.

"Now squeal, rear, buck, throw yourself as you will, my black beauty, you will have to surrender," the New Yorker writes, "for you have found your master. At every bound the cruel Spanish spurs are sent home, and the rawhide 'quirt' raises great ridges along his flanks. It is

the finest exhibition of horsemanship I ever saw. Sitting easily in his saddle, the lithe young fellow sways his body gracefully to the motion, and meets every move of the horse with the utmost nonchalance. With one final and unsuccessful effort to dismount his rider, the horse breaks for the hills, and I follow at the top of my speed. The black horse soon tires of his mad run up-hill, and as I pull in alongside we settle down into a long, swinging, easy lope which reels the miles off wonderfully fast, without apparently the slightest fatigue to horse or rider. We scramble up the steep, broken side of the 'mesa,' and strike off in the same unbroken gallop over the hard, level ground, covered with loose rocks and a short growth of sage-brush. I have ridden all my life in the East, but never before experienced anything like this wild, free gallop over the foothills.

"The handsome, intelligent animal under me obeys every touch or word instantly, and takes the occasional clump of high brush or washout almost at a stride, without a stumble. Never have I seen anything that will compare with these mountain-raised horses for agility or endurance. Suddenly we stop, and my companion gazes intently at a few black dots I can barely distinguish away off near the hills. But even at that great distance he declares they are cattle; and, sure enough, in a few moments we see them plainly. Our orders are to drive on all we can find along the base of these hills, and to do this we must bunch up the cattle we can now see scattered along in little droves, quietly grazing. We separate to work from both sides of the little plain. Taking a long circle, I come in at the 'butte,' which marks the limit of our territory, and run right into a bunch of long horned, wild-eyed cows.

"With a snort, away they go, tails up, the little calves bobbing along behind. My horse is all alive in an instant. Ears sharp forward, eyes watching the flying cattle longingly. I can feel him quiver with anxiety for the word that would send him over sage-brush, washout and badger holes at a breakneck speed. But I am not quite cowboy enough for that yet, and the cattle are taking the right direction anyway."

So he followed instructions, riding along easily, looking sharply into every hollow, canyon and "dry arroyo." He found and started other small bunches after the first, and in a short time they came together with some three hundred or four hundred cattle between them, and started them toward the camp. While they did not make half the progress they did in coming, still the riding was harder, for it was zigzag, twist and turn constantly from one side to the other of the herd, to keep them together and moving. Suddenly, out from the hollow to the right sprang a bunch of antelope, their white, plume-like tails streaming out as they raced with long, graceful bounds over the level mesa.

"Somehow," the writer continues, "driving cattle is not half the sport it was, and when we come in sight of the camp once more, almost blinded by the stifling dust, and hoarse with shouting, I mentally vote that part of ranch life a decided bore. In consideration of my being a 'tenderfoot,' we have been assigned to the shortest ride, and arrive first at the round-up ground. Two men take our places; we ride in, and, unsaddling, turn our tired, foaming horses loose to join the 'caviada' a little distance below. For, short as the morning has seemed, that peculiar long lope has carried us over thirty miles of rough riding. At different points clouds of dust show where the others are returning, and soon long files of lowing cattle come streaming down from the canyons, and join our bunch on the flat. The dusty men and steaming horses come trotting in, leaving only enough to keep the big herd from scattering.

"Dinner is waiting, and the foreman urges the men to hurry, 'for it looks as though we would have sharp work this afternoon.' With a rush the meal is bolted, fresh horses caught and saddled, and with a hurriedly rolled cigarette the men are off to work again, seemingly as fresh as in the morning. My own fresh mount is a steady old pony who enters, I find, with great satisfaction into our part of the work, which consists solely in keeping out of the way, and standing around watching the fun. Nor do I long for activity with the enthusiasm of the morning; my saddle is wonderfully hard, and the gait of my noble steed seems very like unto the emphatic movements of a pile-driver. But we take our stand on a little knoll well to one side, and I soon forget everything in the interest and excitement of the scene spread out before me.

"The round-up ground was a stretch of hard gravel, level as a floor, with but few holes. Surrounded by low hills, one could see every movement as in an amphitheater. The herd of over six

thousand bawling, restless cattle were crowding and pushing each other in the center, surrounded by a circle of motionless horsemen. Down in the hollow, in front, was the foreman, mounted on a superb sorrel, surrounded by several men, the picked 'vaqueros' of the outfit. All were riding their best horses, and had thrown off coat and vest, having fringed leather 'chaperajos,' or leggings, flannel shirt wide open at the front, broad sombrero, and the ever-present six-shooter in their belt.

"A few dismounted, picketed their horses well back, and began tearing up the sage-brush on the hillside, a fire of which was soon crackling merrily, and heating the branding irons that were to quickly cause those unsuspecting infant bovines a deal of discomfort. The rest rode slowly out, the big herd was to the further side, and a small bunch, possibly five hundred, cut from it and rounded up not far from the fire.

"Now began the real work. The men were drawn in from the big herd, leaving only enough to keep it together. Rawhide 'riatas' were taken down, and a man rode into the bunch swinging the loop round his head like clockwork. All at once he let it go, carelessly it seemed, so sudden was it; a quick turn or two round the horn of his Spanish saddle, and the horse wheeled and came trotting up to the fire, a stout calf bounding like a rubber ball at the end of the rope. He protested with all his strength of voice and limb at this unceremonious measure, but the relentless noose had him fast, and in a trice the men on foot had him down, a sharp knife has marked his ears, and the hot branding iron had imprinted his owner's trade-mark on him forever, with a sizzle and a smell of burning flesh that was far from pleasant to one unaccustomed to it. He was released, and trotted off to the herd to find his mother, a bewildered and much-used-up individual. Before this one was fairly down another was dragged in, this time by the hind feet, for so expert do these men become in the use of the rope that they catch an animal almost where they choose."

Then followed a scene, common enough to the acclimated Texan, but a trifle bewildering to the New York man on sight-seeing bent. "In a short time," writes that observant gentleman, "everything is in full swing. Four horsemen are roping and dragging out the calves, and the faces of the men on the ground are streaked with perspiration, dust and blood. The air is filled with dust, smoke and the odor of burnt hair and flesh, while the bawling of the calves and their distracted mothers adds to the scene. It seems the greatest confusion, but is in reality perfect order. Every man has his place, and over all sits the foreman on his horse, quietly keeping count in his note-book of the brand and sex of each calf. All at once a quick shout "Look out, everybody," causes a scramble. A lean, vicious old Spanish cow, grown anxious at the piteous bleat of her darling when the hot iron warmed his ribs, has dodged the herder and is coming to investigate matters. Down through the smoke and dust she charges, her eyes flashing fire, and the slender horns, sharp as a needle, look to me fully six feet long. No one on foot waits to see what she wants; all spring out of the way as she comes, too blind with rage to notice any one, but circles round to the herd, where the sight of her calf pacifies her.

"No one seems to mind it much, and the foreman counsels me, if I am ever caught too close, to lie down and let the cow run on over me. I mentally beg to be excused, judging the uncertainty, as to whether she would jump or not, to be too great a strain on one's nervous system. Her calf is about the last victim in this bunch, and now the men drive them away around to the level over the divide, to frisk over hills as they choose until fall, when they will be rounded up once more to select and market for beef."

Another bunch was then separated and driven in, and the foreman told him there would be work to try the mettle in men and horses. His host and friend had purchased a certain brand, or herd, that ran on the same range, and he wished them marked as were his other cattle. They were principally big, wild steers, a different animal to handle from the little calves. As one of the men quaintly remarked, "It's a white horse of an entirely different color."

This work is usually done in strong corrals, but there were none handy, and the foreman went on the principle that a steer in the herd is worth several skylarking over the hills. First the calves followed the same fate as the others, and after all the youngsters had passed through the fiery ordeal, as many as possible with their mothers were worked out, leaving only a small bunch that included the next lambs to be led to the slaughter. This is figuratively speaking only, for candidly they did not look very lamblike, and he had serious misgivings as to the leading process. Their long

legs, powerful bodies, and particularly their long, sharp, slender horns, effectually dissipated any previous desire he might have had to be a Spanish bull fighter.

Every one paused to rest a moment, and the ropers changed their horses for fresh ones standing near, "cinching" their saddles until their horses fairly groaned under the pressure of the heavy horse-hair girth. They had hardly mounted when one of the wildest steers broke through the line and started for the main herd. Sending the steel into their horses' shoulders, two riders started for him. The horses, the best in a great herd, fairly flew as they skimmed over the level ground and overtook him just in time. But he did not give up; fleet and quick, he dodged and turned and tried to rejoin the herd. Where would the fancy English hunting seat be now? The horses, trained to their work, twisted, turned and dodged with them, now whirling in almost their own length, and again reined back on their haunches, while the cowboys, sitting squarely, stirruped at full length, bent to the sharp curves, with never a glimpse of daylight over the saddle seat.

He made for the hills, was headed, and they swept by within a few feet of them, the steer with head low, thoroughly scared, running for dear life. Close behind was the horse, straining every nerve, his breast white with foam, and his rider's eyes blazing with excitement, riveted on the flying animal and whirling the riata round his head. Quicker than thought he had thrown it, caught the animal by its forelegs, and it came to the ground with a crash sufficient to break every bone in its body, causing the horse, which had stopped and braced nobly for the shock, to plough long furrows through the sand.

In a moment another rope was round his hind feet and the horses stretched him at full length, while the brand was quickly burned on. When the ropes were loosened he got up and trotted tamely to the herd, a much sadder-looking and more lamb-like steer. The usually undemonstrative foreman nodded approval to the gallant "cow-puncher," who smiled at the enthusiasm as he dismounted and loosened the cinch to rest his panting horse.

The remaining cattle were handled in the same manner, but without the excitement of the first, as none escaped the close line of horsemen that formed a living corral. Then more calves, and so on, until just before the sunset, the last of the big herd were turned over the divide, and the long, hard day's work is done. Tired, dirty and hungry, men and horses came straggling slowly into camp.

"After supper," concludes the story-teller, "in the fading twilight, the men lounge round the big camp fire with pipe and cigarette, and I see the genuine cowboy as he is—an honest, reckless, whole-souled man, kind hearted and generous to a fault, who would divide his last crust with, or give his life for, his friend—not the ruffianly desperado painted by so many Eastern papers. Of bad men and desperate, there are many on the frontier, but few of these will endure the hard work and moderate pay of the cow-camps. Many are the yarns of the dangerous and exciting life, which only the combination of a camp fire with a remarkably vivid imagination can produce, and I longed madly to see more of the wild, free life of these nomads of the mountains. And it has its fascinations that only those who have lived it know."

While this chapter was being written there appeared in the St. Louis "GLOBE-DEMOCRAT" a singularly interesting narrative, by Mr. P. W. Horn, on the subject of modern branding, and the work as it is done in some parts of Texas to-day. It took the form of an interview with Mr. Jonas Keith, who, it was explained, "has been at the business long enough to know what he is talking about." The article is so readable and appropriate that it is reproduced at this point in order that its wit and range-lore, to coin a word for the purpose, may be preserved more permanently than would be possible with a newspaper publication only. Mr. Horn opened his story by recording a question as to what is the hardest piece of work a man in the cow business in Texas ever has to do. To which Mr. Keith replied:

"There are a good many things he has to do that haven't much fun in them. Standing guard in the rain or riding around 'em on a dark night would neither one be considered a picnic by most people, but when it comes right down to sweating and tugging and good old hard words, I believe branding beats any job I ever tackled."

"Perhaps the reader," Mr. Horn continues, "may be a little inclined to wonder how the mere making of marks on a cow's hide can involve any really hard manual labor; but if he once learns the

details of the process, all wonder on this point will cease. He will learn, furthermore, that it requires not only muscular strength, but experience and courage and brains. The average hard-working Missouri farmer would find it about as hard to make a success at branding cattle in Texas as he would at building ships in Maine.

"Of course, in order to brand cattle, one must have the proper tools. Branding irons are of two kinds—stamping irons and dotting irons. The former consists of a wrought-iron stamp containing all the characters in the brand. For instance, if the brand were X I T, there would be an iron stamp composed of these three letters, with an iron handle running back from some convenient point, as the middle of the I. These stamps were formerly much in use, but have now become almost completely abandoned, except among the very largest 'outfits.' Their place has been taken by the dotting irons, which consist of nearly a straight iron rod and a half-circle with a long handle attached. With these two implements any letter in the alphabet can be made, and an astonishingly large variety of other characters as well. For instance, the reader can easily understand how the X I T outfit makes its brand by five applications of the straight rod. 'B' requires one application of the straight rod and two of the half-circle. This may not make a very beautiful B, but it makes one which any child that knows its letters would be apt to recognize. If more elaborate designs are wanted, the simple dotting irons are found sufficient to produce them. The straight rod is generally about a yard long, and has a ring in the handle end. The handle to the half-circle is about the same length. They are generally heated in a brisk fire on the open prairie, though on the large ranches there is sometimes a furnace built especially for the purpose.

"For branding any class of cattle properly at least four men are required. Of these four, one is the roper, two are bulldoggers and the fourth is the puncher. As I am writing in the English language, I take it for granted that my English-speaking readers all have a perfectly accurate idea of what these words mean. Of course, we all know that a roper is one who ropes. If necessary, one man can do all the roping required, but two men do better. The roper throws his lariat around the neck of some animal to be branded, and then, by the main strength of his horse, hauls it up within a reasonable distance of the fire. The horse he rides is called the cutting horse. He is called a cutting horse, not because he can cut, but because he is used in cutting out cattle from the herd. Some idea of the hardness of the work may be derived from the fact that during the branding season each roper is allowed from ten to twelve horses for his own individual use.

"When the roper has driven and dragged the steer to be branded to the usual place, he turns him over to the bulldoggers. These men catch hold of the animal and hold him while the puncher applies the hot iron. Does the reader imagine that he and some other man like him could tackle a big full-grown Texas steer and hold him down? Possibly they could if they knew how, but knowing how is the trouble. Even one good able-bodied man can do so if he can manage to get the right kind of grip. Usually, when there is one bulldogger, he plants his knees squarely in the flanks of his prostrate victim, passes the animal's tail back between its legs, and grips it firmly with both hands. It might be well for the reader to remember this the next time he wants to hold a vicious cow down. The attitude may not be a very graceful one, but it gives the man a death-like grip on the brute. The horns may toss viciously and the fore feet pound away at a vindictive rate, but as long as the grip on the tail holds, the hinder quarters stay close to the ground. It is hard on the cow, but it is also hard on the muscular strength of the man who does the holding. For this reason the bulldoggers generally work in pairs. One of them takes the grip just described, while the other one grasps a fore hoof of the animal in each hand, as if in the fervor of a double handshake. When it is a colt that is being branded the attitudes are varied. One man holds its head down, or sits on it, while the other sits down flat on the ground and grasps the upper one of its hind legs firmly in both hands. One might think that for two men to hold a calf down is not very hard work, but when it comes to doing so for hour after hour the work becomes exhausting. Even at best the bulldogger's position lacks a great deal of being a sinecure.

"The time of year when most cattle are branded is in the spring or fall. Most of the calves are of suitable age in the fall, but for grown cattle the spring is preferred, because they shed most of their superfluous hair then. Calves are branded any time after they are two weeks old, but from three to six

months is the usual age. Stockmen say that a full yearling is the hardest animal they ever have to brand. If any man thinks one at that age isn't tough and muscular, just let him try to hold one down. There is one peculiar feature about branding calves, and opinions in regard to its cause vary very widely. Sometimes when a young calf is branded the brand will grow as the calf grows, and when the animal is full-grown, will be fully twice as large as it was originally. Then, again, sometimes, it will remain just as it is, not growing a particle. This seems to be really a remarkable phenomenon, but it is undoubtedly a fact. Some stockmen account for it by saying that it depends upon whether the calf is branded in the dark or the light of the moon, while others are inclined to think it depends more upon the depth to which the branding iron burns the hide. The reader may accept either explanation he likes. Between the two I should prefer the latter, as it would give me much pain if I believed that such an innocent-looking moon as ours could be responsible for all the manifold eccentricities and irregularities of earthly things I have heard charged to it in Texas and elsewhere. It is a fact that branding is sometimes done much more deeply than at others. If the iron is hotter than it ought to be —red-hot, for instance—the hair may catch fire and a needlessly sore place be made on the animal. If it is just hot enough, an application for two seconds is long enough. If the iron is getting cold, it may be kept on the animal for half a minute. Sometimes the bulldoggers have to hold the animal down for ten or fifteen minutes, while the puncher goes and heats his irons a second time.

AN IDEAL BEEF PRODUCER.

"Perhaps the reader understands by this time that branding a large herd involves a large element of real, hard work. He should also understand that in selecting a new brand, a cattleman has to exercise a good deal of discriminating judgment. To originate a really good brand is about as hard as to devise a catching title for a modern book or story. In fact, a new brand is selected very much as is the title of a modern novel. It is not necessary that either one should mean anything in particular, provided only it is something nobody ever thought of before, or is ever likely to think of again. For instance, my friends, Messrs. Price and Keith, brand all their cattle with a large V. Of course, V does not stand for Price, or Keith either, but then it is an easy letter to make, and one that is as little likely as any other to stand for some other fellow's name. Then, again, it would be tolerably hard to change it into some other letter. To get an altogether new brand in Texas is now a very difficult feat. Every letter in the alphabet has been used long ago, many combinations of letters, and all reasonable combinations of figures. A man must be very hard up when he would devise one like this (7777). An algebra student, by the way, would read that 'seven thousand seven hundred and seventy-seven in parentheses,' but the cowman calls it 'four sevens in brackets.' Similar ones are as follows: (9999), (6666).

"These three, as well as the others given below, are well-known brands in actual use in Western Texas. Sometimes it takes about as much ingenuity to read a brand after it is written as it does to think it up beforehand. This is especially the case when the designer gives up letters and figures and tries to represent some object, for the puncher is not always a strictly first-class artist. Not long since I saw a horse that seemed so weighted down with the burden of the letters ornamenting the

whole of one of his sides, that he had little strength for anything else. He read as follows: U S I C S (X). This brand was a complete record of his history. In his younger days he had been bought for our cavalry service and branded U S. After awhile he was worn out, and then received the additional I C for 'inspected and condemned.' When the Government sold him it was recorded by an 'S,' and the man that bought him added the (X). If he is sold any more his next owner will have to begin branding him on the other side. The United States Army officials will not purchase a horse that already has a brand on it. Whether it is because they consider branding an inhuman device, or because they do not want a horse so disfigured, or because they need all the space for their own brands, I do not know."

The following admirable sketch of ranch life and of the general work of a cowboy, is equally instructive, and has the advantage of having been written on the scene of the occurrences of by-gone years by a practical Kansas man for the valuable, and indeed classical, work on American Farming, by Charles L. Flint, who, for more than a quarter of a century, was Secretary of the State Board of Agriculture of Massachusetts. Mr. Flint's correspondent writes of his own experiences and of the habits of Texas and Kansas cattle with the detail of an expert and the brightness of a professional writer.

"It is the early dawn of a May day in Western Kansas. A sea of rolling billows of land extends in every direction to the utmost reach of the vision. The plains are covered with a rich growth of blue joint and buffalo grass. A herd of cattle is sleeping in the corral by the creek—cows, two-year-olds, yearlings and calves. A few ponies are picketed with long ropes on the prairie. A couple of saddles, blankets and bridles hang on pegs by the corral bars. The scene is eminently peaceful. Occasionally a cow rises, and, walking to the salt barrel, generally licks the salt, then licks her nose as though she had serious thoughts of pickling it so as to ensure its keeping over summer. But on reflection she concludes it will keep this season at any rate, and walks over to the stretching posts and there stands rubbing her neck up and down.

"Suddenly stopping she gazes, open-eyed, at a wolf, who sits on her haunches some hundred yards from the corral, sitting there pensively, looking at the great amount of fresh meat. After gazing at the wolf until satisfied, the cow lies down again. The deep breathing of the cattle, the morning calls of the meadow larks, the soft music of the wind as it whistles through the short, tender grass, are the only sounds heard. As the East grows red, the occupants of a large dug-out, situated by the bank of a creek, lounge slowly out and walk to the water, where they drink and wash—the latter is a speedy operation, as the herder does not waste time in washing. One goes to feed the ponies corn and saddle them, the other builds a fire and cooks the breakfast. This meal consists of corn dodgers, or baking powder biscuit, fried bacon, and strong coffee without milk or sugar. There may be two hundred cows in the herd, but none are milked.

"The herders simply exist with as little trouble as possible. As a rule, they do not read, do not think of anything but the cattle. To attend these well is their ambition. After breakfast the bars are taken down and the cattle string slowly out of the corral. Forming in long lines they follow the deep, well-worn trails that lead to the feeding grounds. It is a very leisurely march. Now and then an animal drops out of the file, eats a few mouthfuls of grass, but soon drops into file again and resumes marching. On reaching the desired feeding ground, the cattle spread and begin feeding. At about ten o'clock they are full, or nearly so; and, in a listless manner, they change front and feed toward the water. Arriving there, the herd drink, stand in the water, and so 'loaf' away an hour. Then they lie down and for two or three hours remain quiet. As the sun gets low, the cattle again spread and feed. As the sun sinks to the horizon, the herders slowly force them to feed toward their corral, and by the time they have fed up to it, it is generally dusk. Bars are put up, ponies staked out, supper cooked and eaten, and the herders go to bed.

"In all herds there are a few animals that lead off; that is, they will not remain on your range, but constantly endeavor to lead the herd to pastures new. These animals are generally yellow or black steers; but sometimes cows and heifers are guilty of the trick. Of course these animals are sold as soon as possible, but until sold, they are the cause of a vast amount of hard riding. The cattle of Texas are not afraid of a man, nor are they afraid of a horse, but they are afraid of a man on a horse. They do

not seem to understand that a man on horseback is a combination of animals. Apparently they regard the two as one animal, and one that is too powerful for them. To get off a horse in a herd of wild Texas cattle is almost worth a man's life, and an experienced herder will never do it.

"All herds of cattle have a bully among them. There is a boss cow, and she is hated and feared. Of ugly disposition, constantly hooking unoffending cows, greedy in eating, she makes herself generally disagreeable. Or it may be that the bully is a steer; the characteristics of the brute are all the same. The rest of the herd are all afraid of her or him. Singly they can do nothing. Matters go from bad to worse, and cow life becomes almost unendurable in the herd. Something has to be done, and that soon. The bully in walking along gives some unoffending cow a sharp thrust in the ribs. Instead of running off, as expected, the stricken cow wheels around, fury in her eyes, and, bellowing a war cry, dashes head on for the bully. The boss is surprised, but gets to work as an expert, and the rebellious cow is being rapidly whipped (these cattle fence with their horns), but the cry for liberty is understood by the rest of the herd, and with a unanimous movement they all turn on the tyrant, and if the herders do not interfere, they kill him.

"The bully, being whipped, turns to run, and to his horror finds that the whole herd are after him. As one animal gets near him, he receives a vicious dig from a sharp horn. He increases his speed, but soon another animal comes up to him, and another stab is the result. The bully, with extended tongue and labored breathing, is leading the herd, and the herd, with extended tongues and upright tails, are following—steers, cows, calves, all bellowing loudly, 'kill him!' 'kill him!' And kill him they will if the herders do not stop the pursuit.

"After a lesson of this kind the bully is a marvel of gentleness and consideration. A calf could whip him. Once I left my herd for an hour. On my return I was surprised to find the cattle bunched around a deep pool in the ravine. They were evidently greatly excited; the constant bellowing, the lashing of their tails, their craned necks as they looked over the banks of the pond, all indicated that something was wrong. Running my horse and swinging a heavy whip, I was soon among the cattle. They gave way for me. I rode up to the pool. There, standing in deep water, was the bully, a ring of excited steers and cows standing around him, but unable to reach him. I put a stop to the fun, and left the bully in the water to cool off. I did not see him for a week. Then he joined the herd a private. If an animal in the herd gets badly wounded, it will be killed by the others if great care is not exercised. The sound animals turn ruthlessly on the sick or wounded ones.

"It looks hard, and the unthinking observer remarks on the cruelty shown to one another by dumb animals. It is simply an expression of the instinct of the animals, by which they expect to ward off attacks of wolves, and to prevent their prowling about the herd by removing the inducement to it. The animal is wounded, badly wounded; the wolves smell him, and, from far and near, gather about him. The cattle in their wild state constantly moved up and down the water courses; so when they killed the sick animal they left the body behind. Now they kill the sick one for the same reason, and daily feed about his carcass.

"In July the herd is fat; calves are doing well and are full of play; grass is plenty, and the herd, as a whole, feel splendidly. They are easily amused, too. Jack rabbits are plenty in Kansas, and are a never-failing source of amusement to the cattle. Accustomed to the habits from their calfhood up, it is simply absurd to see the actions of the animals. A calf finds a big jack rabbit, and, very naturally, is interested in looking at this wild beast. Cautiously approaching him, she gazes open-eyed at the small monster. Another calf joins her, and they each regard the animal. Beginning to caper about it, the attention of the herd is attracted, and they all come up to have a look at the jack. He is made to get up and jump quietly off. The cattle all follow; the rabbit sits down, again to be forced up; and when he again jumps off they caper around him, or, with pretended alarm, they bellow and run away.

"Many men who came to Kansas in 1869 went into the cattle business, bringing Eastern ideas with them. They very naturally built sheds to protect their cattle from the cold storms of the winter. I did this, and made a mistake. The reason why sheds are not good is that the cattle stand under them when the cold winds blow, and refuse to leave the shelter to feed or drink, and when weakened by this lack of food they lose vitality, and huddle together for warmth. This huddling together is very

dangerous; the outside cattle want to be on the inside, and they pile up on each other. This piling is called 'stacking,' and when once begun, some of the cattle are sure to lose their lives. Out of one stack I took twelve dead steers one morning. A neighbor of mine took thirty-six dead beeves out of one 'stack.' After losing the twelve steers I took down my sheds, and that ended the trouble."

We pass from this realistic picture of cowboy life and cattle characteristics, to note for a moment the nature of the work the cattleman and his help are called upon to perform on the road to market. As we have already mentioned more than once the railroads have put an end to most of the necessity for trail driving which, under existing conditions, is hardly possible. But even in the days of railroads there is still a great deal of driving to be done. When the day of delivery to the drover arrives, the animals are driven to some previously secured corral, and when all are in and the herd is complete, then the job of road-branding begins, which, by the aid of plenty of help, is soon completed. All things being ready, a start is made, but not before the drover has secured and recorded a bill of sale from each ranchman or his lawful agent, from whom the stock was purchased. The bill of sale sets forth not only the ranch brands, but all the ear marks. The appearance of a bill of sale is much like Egyptian hieroglyphics. The more a Northern man looks at one the less he knows about it. But it is necessary for the drover to have it, for without it the officers of the law would regard him as a thief, and, of course, arrest him. Now that a start is once made, hard driving for the first few days is the custom. For several reasons this is done; first, in order to get the stock off of their accustomed range, whereon they feel at home, and know all the country, and are much harder to keep under control than when on strange ground; second, it is done to break or accustom them to being driven, at the same time to tire them by hard traveling so they will feel at nightfall like lying down and resting instead of running off, as they would be sure to do if they were not fatigued.

"We have heard," says a well-known writer, "drovers say that they have traveled the first three or four days at the rate of twenty-five or thirty miles per day. But as soon as the cattle are driven off of their usual range, and are got on to the regular trail, the distance of a day's drive is reduced to ten or at the most fifteen miles. They are permitted to go out on the range in the morning early and to feed, care being taken that they be kept headed in the direction the drover is desirous of going. They will feed along for two or three miles, then turn into the trail and travel three or four miles, when, after drinking their fill of water, they will lie down and rest from two to four hours in the middle of the day. Getting up from their beds, they soon turn from the trail upon the grass and take their afternoon feed preparatory to being rounded up for the night. When upon the bed ground one or more men remain with them during the silent hours of the night, being relieved by regular relays from the camp, much as the soldier upon guard is relieved. With each herd are about two men to every three hundred cattle, and each man should have at least two saddle horses, which he rides alternately, they living exclusively upon the grass. The extra horses not under the saddle are called the cavvie-yard, and are driven behind the camp wagon, which is drawn by one or more yokes of oxen, and is often a cumbersome, rude cart, made with an eye to strength rather than beauty, and is made the receptacle of the provisions and camp outfit."

To drive a drove of cattle properly under these conditions more patience and perseverance than labor was required, but, at the same time, the duties of the cowboy was often arduous, and he was frequently exposed to great danger and hardship. To partly offset the difficulties and reduce the expense, it was frequently the practice to have a few old and practically worthless animals included among the younger steers in order to check stampeding. This occasionally had the desired effect, but it is a characteristic of Texas native cattle to run an immense distance. The better bred cattle of to-day carry more weight than their native ancestors, and seldom run a very long distance. But in the old days, when excessively long distances had to be traveled, the animals on the trail would be guilty of a great deal of wandering from the straight path. One or more cowboys always took the lead on exceptionally good ponies. Their duties consisted not only in keeping the leaders in the right direction, but also in driving off range cattle which were met in order to prevent the delay and trouble of cutting out, which otherwise would be necessary. When the herd was large it was strung out at considerable length, and cowboys were employed to ride up and down the lines and keep the stragglers in their places while others brought up the rear.

It was at night that the most difficult and tiresome work had to be performed. When an immense herd of cattle were being driven, precautions taken against trouble during the dark were elaborate in the extreme. Tex Bender, known as the "Cowboy Fiddler," writes in an entertaining strain on the occupation of night watching. His remarks, while of course they apply to a certain extent to the duties to-day, are more directly intended to refer to trail driving of old days, and they show the peculiar habits of range cattle as observed by a man who worked among them for many years. It is important, this writer points out, that the herd should never be left unwatched.

"When at night it is thought time, they are driven onto a bedding ground and bunched up. So soon as they have steadied down, one or two men are left on watch, whose duty it is to ride round and round the herd and prevent any straying. If the weather is not too cold, the night watch not too long and the cattle behave well, this is not disagreeable work. The cool air is refreshing after the long day's heat and glare; you walk your horse at a little distance from the cows, with an occasional short scamper after some rebels; you must, however, keep moving, and show yourself constantly on all sides. One by one the animals lie down. You hear a great puff as if all the wind was let out of a big air cushion; it is a steer settling down onto his side; more puffs, the shadows sink low, and at last there are none left standing. The quiet of all these huge animals is impressive, and seems in keeping with the sleeping earth and calm sky; the voices of the men in camp hardly reach you; a flicker from the fire catches the higher part of the wagon and just marks its position. Provided nothing extraneous disturbs the peace, the cattle will lie still up to eleven or twelve o'clock of night, while you circle in the darkness round the black patch on the ground, keeping a sharp lookout for any shadowy objects sneaking off in the gloom, and often riding to investigate a suspicious object, which turns out to be only a bush.

"Before midnight, under some special ordinance of nature, the cows are restless and get on their feet; a few will try to feed out; these you must drive back again. But before that time, if holding the first watch, you have probably been relieved, and are back in your bed. Each man has a horse saddled and picketed near the camp all night; as, if anything frightened the herd, or a storm came on, all hands must turn out and mount. If the cattle are really away, you must be after them without delay, and so soon as you can, stop them, bring them back to camp, provided always you know where it is. Any one left behind will make a good bonfire to direct the boys; but a dark night with rain prevents you seeing far, and the camp has often been chosen in a sheltered spot, which makes it more difficult to discern the blaze. The main thing is to keep the herd together, whether still running or halted. If matters have been well managed, and no serious disturbances have occurred, the herd makes up and starts out at daylight. You string them out along the trail, and take a count, or look that all the bulls and other animals with distinguishing marks show up present to the roll-call, and move off on another day's expedition."

The work to be done under the modern system of shipping is very different. When the pens at the railway stock yard are full the steers are driven up a chute into the cars. There is not much trouble with the first few animals, but toward the last a good deal of pushing and crowding has to be done in order to fill the car, and unless proper precautions are taken, injury is apt to result. As soon as the last cattle have been driven in, the train starts, and on most lines they are run rapidly, and given the right of way over ordinary freight, and even passenger traffic. The present improved cattle tracks enable cattle in transit to be fed and watered very thoroughly, but on long runs the train is halted daily and the cattle taken out to feed. During the night, in the train, the cowboys in charge have to force to its feet any animal that has laid down. Unless this is done animals are trampled to death, and serious loss results. So expert do cowboys become in their work that they are expected to load two or three hundred beasts into the train in twenty minutes, and any delay is regarded as serious.

Although the railway journey to Chicago, St. Louis or other markets is less arduous in some respects than the old work on the trail, the journey is far from being comfortable. The boys have to get what accommodation they can in the caboose which is often crowded by railway officials. No sleep is possible during the night, because at every halt the men must jump out, one with a lantern and others with goads, walk along the rough ballast and peer into each car to discover beasts which require stirring up. "Having found an offender," writes Mr. Bender, "you poke her, prod her, twist her tail,

and do your utmost to make her rise. In the middle of your efforts the bell rings, the train starts; you clamber up the side of the car onto the roof, and when there make the best of your way back on the top of the train to the rear car. This little trip in the dark is not one to enjoy. There may be twenty cars, say forty feet long each. Before you have crossed two or three the train is going at full speed. Only one man has a lantern; you are incommoded by a heavy great coat, as the air at night is keen; the step from car to car requires no more than a slight spring; but it is dark, or, probably worse, the one lantern is bothering your eyes. The rush through the air makes you unsteady; no doubt your nerves are making your knees feel weak. It is a hard alternative: to get back to the caboose, or to sit down in the cold on the top of the train until you reach a halting place; having tried both, it seems that neither can be cheerfully recommended. If you do not climb onto the roof you must take your chance of jumping onto the step of the last car as it goes by; this would be the reasonable way if you were allowed to do it, but as the engineer does not care to look back, you must consider whether you are sufficiently an acrobat to rejoin. Having reached Chicago there is an end of the business; the cattle are turned into the big stockyard, and sold by commission."

ECHO CAVE, PALO DURO CANYON, TEXAS.

CHAPTER XII.

An Essay on the Shortening of the Horn and the Improving of the Breed.

THE misapprehension which prevails in various parts of the United States as to what is going on in other portions is one of the natural consequences of the immense size of the country. Texas itself is an empire of magnificent distances, and even to-day with the excellent railroad service which prevails, a journey from one portion of the State to another is often both tedious and lengthy. It is not very surprising in a country upon some portion of which the sun never sets, and which includes both tropical and arctic regions within its domains, that the people of the North should know comparatively little concerning the manners and customs and habits of the South. Nor is it to be wondered at that an entirely erroneous impression should prevail as to the cattle to be found roaming on the plains of Texas. A generation ago fences were unusual commodities in the Lone Star State and cattle roamed largely at will, herded and finally rounded up in a manner now impossible and unnecessary. Other changes of a phenomenal character have passed over Texas during the last thirty, and even twenty, years, but, perhaps, no change has been more conspicuous or interesting than in the grade of cattle raised and pastured within its extensive borders.

When there was an abundance of free pasturage it was only natural that native cattle of the hardiest possible character should be raised. The Texas steer, with its abnormally long horns and general "cussedness," was then monarch of the Texas plain. An illustration is given on page 183 of one of these peculiar animals whose horns measured three feet six inches, from tip to tip, and which weighed at the age of five years less than a thousand pounds. To-day an animal of this grade can still be found in the Southern portions of Texas, but the horn has gradually shortened, and, in a measure, even disappeared in the Northern counties, while the lank and lean appearance has given place to a larger body and a greater capacity for putting on flesh.

Allen, in his "American Cattle," one of the best and oldest authorities on the subject, asserts that the Texas steer is the lineal descendant of the early Spanish stock imported into Mexico by the adventurers and pioneers of the sixteenth century. The writer of this work spent some months in Spain a few years ago and is inclined to think that Mr. Allen is absolutely correct. Spain is one of the least developed countries of Europe at the present time, and it still contains immense quantities of unimproved grazing and mountain land. On this land herds of cattle very similar to the ancient Texas ideal are to be seen; and it is also to be noted that the climate of Spain resembles, in some respects, that of Texas and Mexico, without, of course, the "northers" which, from time to time, visit the former State.

Professor Lowe, a European authority on domestic animals, writes even more pertinently concerning the introduction into America of the ancestors of the typical Texas steer. He agrees with Professor Allen as to the Spanish descent, but is of the opinion that the animals came to this country via South America. He even goes so far as to assert that "the origin of these amazing herds which cover the plains of Paraguay, Buenos Ayres and other provinces, is traced by Spanish writers to the arrival, by way of Brazil, of seven cows and a bull from Andalusia at the city of Assumption on the ship Paraguay in the year 1556." He proceeds to give instances of direct importations from Europe to Mexico, and also from South America into that section of the continent which we now speak of as the Latin-American Republics. From the latter to Texas the distance is inconsiderable, and when the history of the State is remembered it will readily be understood how the Spaniards left behind not only many landmarks and buildings, but also a distinct type of cattle.

Mr. George W. Curtis, Director of the Texas Experiment Station and Professor of Agriculture in the Agricultural Mechanical College of Texas, describes the original Texas cattle as of varying color, with light dun and mouse color predominating, although not sufficiently to exclude reds, yellows and blacks. A resemblance to Spanish cattle generally is shown in a tendency to lighter color hair around

the muzzle. The cows, the Professor states, are practically worthless for the dairy, few giving more than one or two gallons of milk per day on good feed. But, he adds, the value of the race to the whole country where it owns a natural home can hardly be overestimated. Texas steers, he estimates, average from nine to twelve hundred pounds at four years old, grass-fed, the cows seldom exceeding the first named weight. A distinguishing feature lies in the extraordinary size of the horns, which assume various wide-spreading shapes, sometimes measuring upward of four feet from tip to tip.

Mr. Charles L. Flint, writing in the year 1882, also attributes the origin of Texas cattle to Spain, and says they were introduced into Mexico about the year 1500, when Texas was a part of that country. He also says that they are identical with the cattle kept for many centuries by the Moors and Castilians, and speaking of them he says: "The cattle thus imported into Mexico covered the vast grazing plains of Texas and California, becoming to all appearances wild cattle, feeding upon the abundant herbage the climate and soil of these regions afforded. Immense numbers of them have been killed annually until within a few years, simply for their hides and tallow; notwithstanding they had increased to the extent that within a few years their estimated number in Texas alone was over four millions, and at that time constituted about one-seventh of the cattle of the United States and Territories. They congregate in large herds, and range and propagate with little care, being known to their owners only by the marks or brands that are put upon them. They are gathered once a year for identification, when the calves are castrated and branded, while those fit for beef are selected and driven to market. They are impatient of restraint, and, having led a wild, roving life, never become really domesticated. When from five to seven years of age they average about a thousand pounds, live weight, but when fed on corn for some months they will reach an average of twelve hundred pounds, with perhaps from six hundred to seven hundred pounds of marketable beef, as weighed from the butcher's block. These cattle are of almost every color ever represented in a bovine animal; they are tall, lank and bony, with coarse heads and exceedingly long horns; flat-sided, swayed in the back, with high flanks, narrow hips and quarters, and long and coarse legs. As beef animals, they have a large amount of offal in proportion to their flesh. The cows give only sufficient milk for the nourishment of their offspring, and are nearly as large as the oxen."

Such is the very brief description of Texas cattle of ante-bellum days. In the opinion of many who have not given the subject a thought the Texas steer of to-day resembles the peculiar animal which roamed at will over the plains during the sixties and, indeed, the seventies. It is part of the mission of this work to show that this is an entirely erroneous impression. Car loads of Texas cattle, with their immense horns interlocking, are still occasionally to be seen, but these are shipped almost exclusively from extreme Southern counties. Tens of thousands of dollars have been spent in improving the breed, and the average Texas steer of to-day is worth infinitely more than the average Texas cattle which used to be looked upon as the best the State produces and as the most profitable breed to be raised and perpetuated.

General Brisbin, whose interesting work entitled "BEEF BONANZA" has had an international circulation, writes in an entertaining manner concerning the habits and customs of Southwestern cattle. After citing the fact that he visited the herds of the Plattes and made careful inquiry as to the number of cattle and the profits derived from cattle breeding, he said:

"On the Laramie plains I saw the finest cattle, and one herd in particular pleased me, a drove of fifteen hundred cows, with twenty-three hundred calves of various ages. First we came upon a few stragglers, or warders, guarding the herd, which seemed to be sentinels over the calves. Next, we found families of two, four, and six in groups, then bunches of a dozen, and lastly the great body of the herd. The cows were Texan, bred to large Durham bulls, and the calves bore strongly the impress of the male. Nearly all had thick necks, sturdy bodies, and seemed very healthy. I saw one enormous bull, and near him a cow with three calves, one a two-year old, one a yearling, and one about two weeks old. It was a grand sight this herd of fifteen hundred cows, fifty bulls, and twenty-three hundred calves. They were much scattered, covering the prairie for miles, and seemed an endless mass of beef for one man to possess; yet I was told that the gentlemen who owned this herd had three larger ones. I saw a little calf just taking his first steps on the prairie, and stopped to observe him. The cow ran away at my approach, but immediately came back and stood resolutely and defiantly by her young;

indeed, so wicked did she look, that the driver whipped up his horses and got away as soon as possible. These Texas cows are dangerous if approached too closely, and, from the fire in the beast's eyes, I am sure she was going to charge.

"It is a study to observe the habits of the prairie cattle. They run in families like buffalo, the cows keeping their calves with them sometimes until they are three or four years old. It frequently happens that the mother has under her protection sons and daughters larger than herself. The cow watches over her offspring, and when they disobey punishes them with her horns, to which they tamely submit, like well-trained children. In the middle of the day the cattle leave the high grounds and go to the river bottoms for water, and about nightfall return to the high grounds. In traveling back and forth to the water they march in single file, using the same paths as the buffalo, and, like them, wear deep ruts in the earth. The cattle frequently go four and five miles to water, but, having slaked their thirst, nearly always return to the same ground from which they started out."

It is rather more than twenty years since the first extensive importation of high-grade stock into Texas commenced. The work was retarded by fear as to the serious consequences which might result to a valuable stock from Texas fever and other disease. It is a fact that in some cases valuable stock imported for the purpose of improving the breed did suffer in the manner stated, and a great deal of unnecessary comment arose. Those who made attacks on Texas in consequence of some of the failures in the attempt to breed up to the long-horned Texas cattle, overlooked the fact that acclimation is something which has to be understood and mastered by every living creature that is suddenly moved from one climate to another. The cattle taken an immense distance to the plains of Texas were frequently exhausted after a long journey in unsuitable cars far inferior to those now used. During the journey they had frequently been poorly fed and indifferently watered; the result being that after they were driven out to pasture in their new home, they were in bad shape and succumbed easily to disease.

This is not a work on botany or agriculture, or something might be said of the difference between the grasses found in the different States. It is, however, obvious, that while the grass of Texas is eminently suited for grazing purposes and is able to withstand extremes of temperature in a most extraordinary manner, it is entirely different in substance from the blue grass of Kentucky and Missouri, and still more different to the grasses to be found in the States of Illinois, Ohio, and further East and North. The conditions of herding cattle in the North and East are even now very different, and a quarter of a century ago the difference was still more marked and important. Hence it would have been very extraordinary had the first attempts at introducing better blood into the stock of Texas cattle proved a success.

The point that ought to be made clear to all critics is, that there is no insurmountable difficulty so far as Texas is concerned in acclimating cattle from a distance. Efforts have been made to introduce into other States, both within and without the alleged infected area, breeds of cattle which have been healthy and vigorous in other States, and some of the results have been heartbreaking. Many a farmer who has been induced to change his location, has taken with him his farm stock only to find it die off on his hands with apparently no reason whatever. Sometimes it resulted from the complete change in food; at others from the even more marked change in the quality of water, and sometimes from the too sudden change in climate. On one occasion an English colony brought with them from the old country a number of well bred cattle, some Shorthorns and some Jerseys. They located in Dakota, and during the first winter lost their entire stock, with the exception of one heifer, which was the poorest and least symmetrical in the entire herd. No one has yet suspected Dakota of being a hot-bed of Texas fever, and the cause for the calamity was a very different one.

After the first efforts and a few instructive, albeit disastrous, failures, more care was taken in Texas in the matter of details of importation. A Texas cattle raiser contributed to the National Live Stock Journal some years ago a very admirable article showing how precautions could be safely taken against loss in the manner described. After suggesting that the importations should, as far as possible, be limited to the animals of six or eight months old or even younger, the writer goes on to give directions, which are such a good index of the steps finally taken to produce the important results achieved in the way of breeding up Texas cattle, that we here reproduce a portion of the article:

"The cars for transportation should be well bedded, and food for the entire trip transported with the stock. Arrangements should also be made for a through trip when starting. Food, water, and careful watching by the herdsman will land them at the place of disembarkation but little damaged by the trip. Care should be taken not to crowd too many in one car. Thirty head can be taken if they are properly cared for, yet twenty-five head would do much better. The calves designed for shipment in one car, if more than one is to be sent, should be permitted to run together for some time previous to starting. After reaching the terminus of their journey by rail, a week's rest, in dry lots, should be granted them, with the same kind of food as before shipment. When taken any distance, slow and easy travel should be given them. If either costiveness or its opposite is exhibited, simple remedies should be given to prevent the too active purging or relieve the constipation. The preparation for the reception at their Texas home should have been completed in advance of their arrival; and in addition to a supply of corn, oats, and wheat bran, pure running water and a free access to a growing oats or barley patch, which should have been sowed in early autumn for their benefit, should be allowed. Suitable protection must be provided to guard them from the cold blasts of our 'northers,' giving, also, prompt attention to any symptoms of fever, as follows: When the animal is discovered ailing, one tablespoonful of powdered charcoal, one teaspoonful of powdered ginger, and, in about one hour, one quart of marshmallow infusion—i. e., boil the mallow in hot water until you obtain a strong decoction—and one quart of camomile tea. If marshmallows are not to be had, give large doses of saltpetre; and if the animal is not relieved after eight or ten hours, repeat the above. Give plenty of green food as the appetite returns. This treatment has been quite effective; fully 95 per cent of cases thus treated have recovered. The symptoms, when taken, are restlessness, dull eyes, and moping movements, with an inclination for solitude, constant straining to make urine, and the little voided of bad odor and red in color. The bowels are either very costive or much given to scouring.

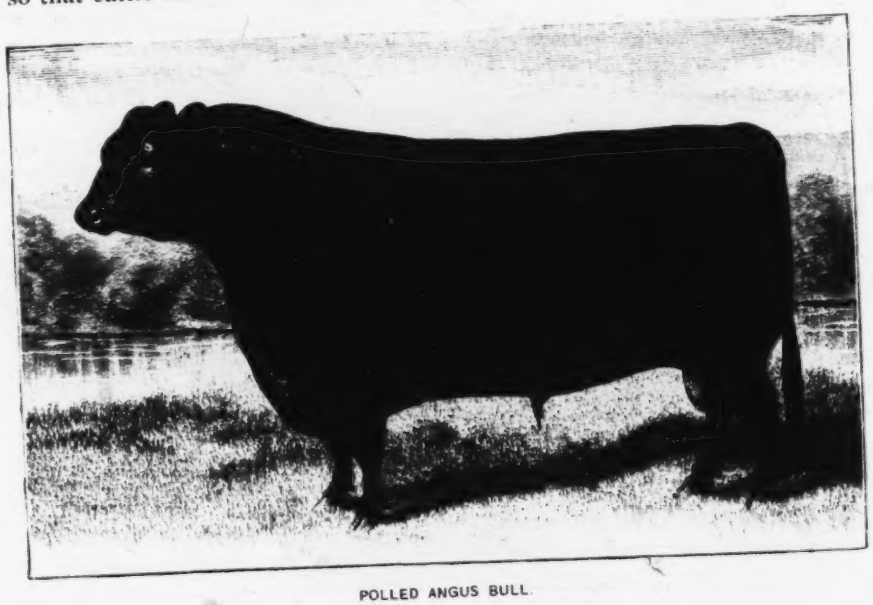
"The most important discovery I have yet made concerning the future of thoroughbred cattle in Texas is this: They can, under proper restrictions, be imported and acclimated at not exceeding a loss of ten per cent. This can be accomplished by following the course that we here lay down. If December and January are passed without fever, you can feel safe from its ravages until the rains of spring, followed by the heat of June, when the ticks and vermin menace them. Then avoid exposing them to either rain or sun, and destroy the vermin by a free use of either coal oil or lard, using two parts of the latter to one of the former. If only spring calves are brought there will be less of fever than if older animals were brought. Too many who bring young stock to Texas stint and half-starve them, thinking that to keep them in good growing condition increases the chances of disease. My observation teaches the reverse to be true. To secure a complete development of bone, flesh, growth, and early, profitable maturity, a calf must have generous treatment—plenty of nutritious food, good water and kind treatment. I have heard men complain that Texas Shorthorns were not growthy and handsome, like those exhibited at Northern fairs. The reason for the dissimilarity was readily found, on investigation, to be that the one had excellent feeding and grooming, while the other, in addition to a long winter, starvation and acclimation, with a spring and summer with rain and hot sun, had his vitality almost destroyed by ticks, lice and vermin. Cattle from the North cannot be acclimated unless generous food, comfortable quarters and kind treatment are given to them during their first year in Texas; and unless this treatment be kept up they are worthless when acclimated."

In short, science teaches and experience proves that Texas cattle of ordinary type can be crossed with high-grade cattle, and that if each succeeding generation is bred up, the cross will produce—and, indeed, has produced—in four generations, cattle equal in every respect to the original imported stock. Of course, selections were made by the pioneers in this work with a view to perpetuating, as far as possible, good qualities in native cattle, as well as introducing the far better and more conspicuous advantages of the more costly breeds. The influence of careful selection in this way can be easily appreciated, and the result of it has been that while in some cases a tendency to revert to the original or imported type has been noted, in others there has been an equally marked tendency to improve. In other words, the mere expenditure of large sums of money in importing graded sires, with high records and unequaled percentages of points of excellence, has not in itself sufficed to bring about the desired

results. Eternal vigilance has been exercised by the most successful importers, and the result has more than justified both the expenditure and trouble involved.

The difficulties in the way of introducing high-grade cattle into Texas have been further reduced by the dipping-vat just brought to a state, if not of perfection, at least of practical adaptability. By its use the mysterious "tick," which does such deadly work at times, is reduced to a condition of harmlessness, and one great danger in the matter of graded cattle importation done away with. The main vat in the contrivance referred to is about forty feet long, that being the distance from the point of entrance at the trap or spring-board to the dripping-platform. The vat is made out of cypress wood, two inches thick, with four by four studding. Provision is made for six feet depth of a carefully prepared, chemical dipping fluid, and the sides are extended four feet above the high-water mark, so as to prevent waste by splashing. The bottom or floor of the vat is two feet wide, but the sides taper outward, giving seven feet width higher up, thus preventing trouble from long horns.

Various precautions are recommended. Thus cleats should be nailed to the inclined plane at the end of the vat, so that cattle can walk out without slipping. Cleats should also be nailed on the dripping-platform, so that cattle can stand without slipping. The platform should be enclosed by a good



POLLED ANGUS BULL.

fence, to keep cattle on the platform while the dip drips off and runs back into the vat. The trap-door should be covered with sheet iron, so as to keep it from wearing rough, and it should be fastened over the end of the vat by means of an iron bar, and held under the trap-board by means of strong staples. This iron bar should rest on the end of the vat and pass through the two end studdings of the vat. It should be fastened or placed not quite in the center of the trap-door, so that the weight of the longer end of the trap-board will cause it to drop back level. The chute at the end where the trap-board enters it should be built solid, with perpendicular sides, and not more than one inch space should be left between the sides of the chute and the trap-board, so that the feet of steers can not catch in it.

The vat should be placed into the ground, say six feet, leaving only the sides to project four feet. The plan adopted is useful in separating large from small animals, dipping the grown cattle first, and then, when the dip may be lower, the smaller. Sufficient fluid should be kept in the vat to entirely submerge every animal.

The cattle are driven eight or ten at a time into a small pen, which ends in the chute leading to the vat, and then are driven one after another into the vat. As they step on the trap-door they are plunged into the vat, thus submerging them completely. This is very essential. When the dripping-platform is covered with cattle, they are kept there a sufficient time to permit the greater portion of the

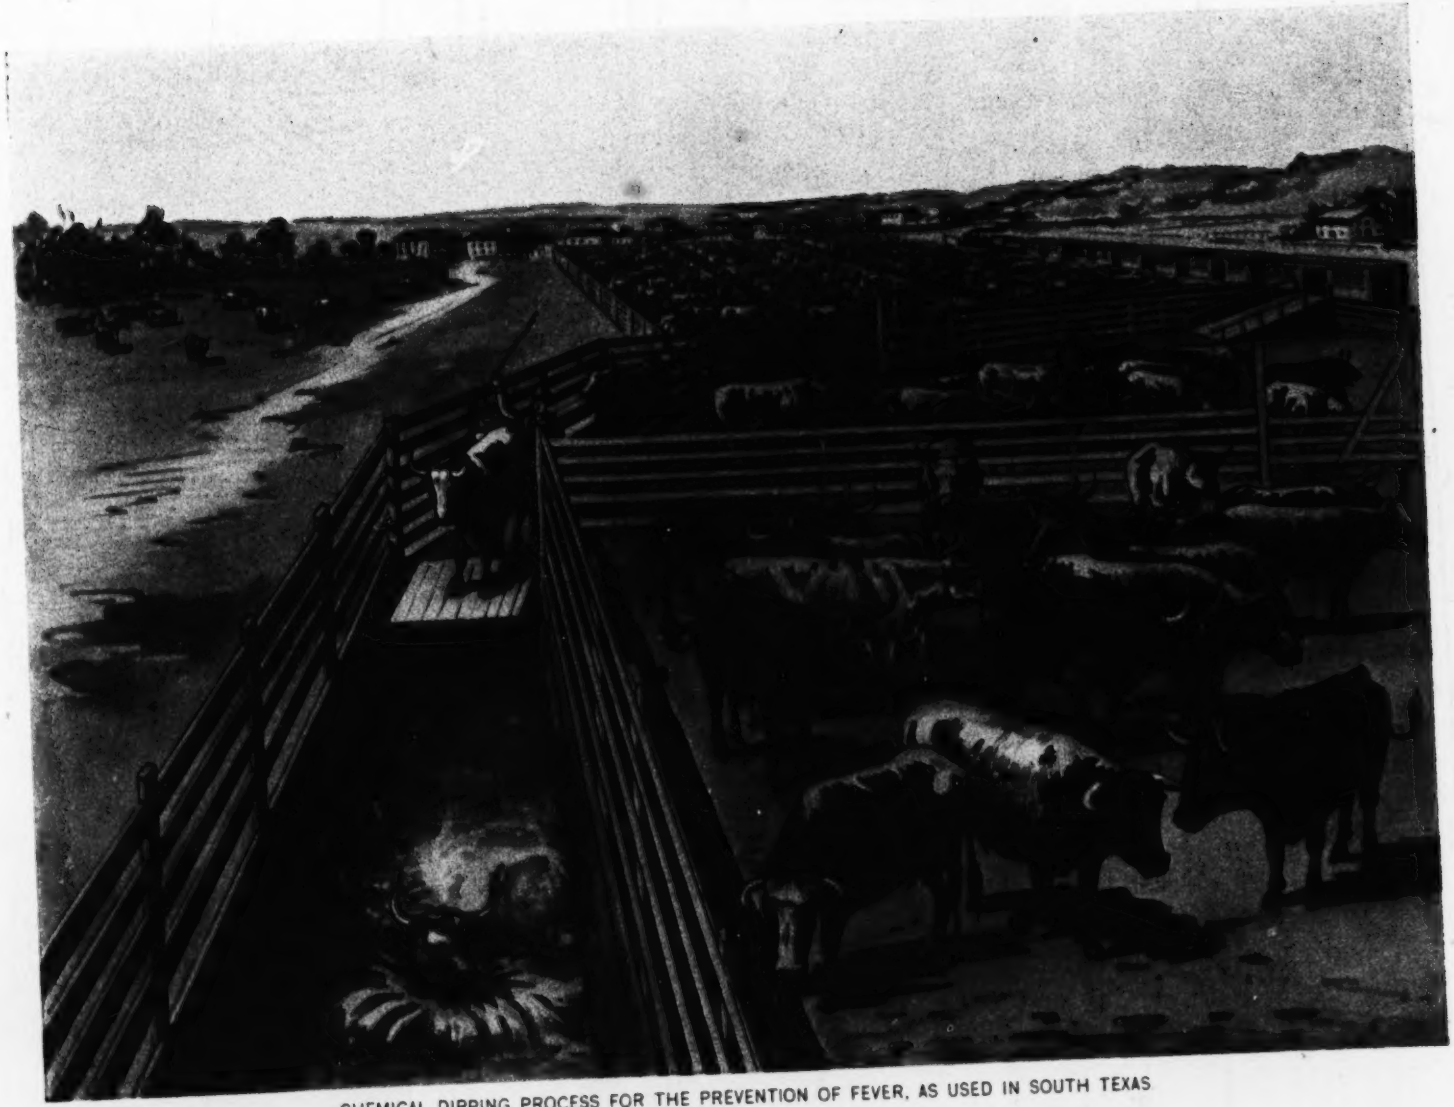
dip to run back into the vat, and then they are turned into the holding pen and another lot passed through the dip. By means of this process cattle are not only freed from lice, itch and ticks, but it is believed that by freeing cattle from ticks they are so disinfected as not to communicate or contract splenetic or Southern fever.

The Shorthorn has perhaps done more toward the improvement of Texas cattle than any other breed. This is a breed of cattle which is appreciated at its full worth in Europe, where the longhorn breeds have been one by one pushed to the wall until now they are seldom found, except in comparatively obscure districts, and occasionally on farms, the owners of which cling to old traditions and believe that an excessively long horn is no detriment. An immense majority of farmers and cattle raisers in all parts of the world regard the long horn as objectionable in a variety of ways. As a weapon it has outlived its usefulness. The wolf and other animal enemies of cattle have been driven back by the same influences which have curtailed the size of ranches and remodeled the entire system of cattle raising. The long horn, which was perhaps an advantage a generation or two ago, is now nothing but a nuisance. In the opinion of eminent authorities, it retards development and fattening, and experiments in dehorning, of which we shall speak later, generally bear out this theory. Long horns, as we shall see later, are also exceedingly objectionable when cattle are being stall fed; a large amount of space being wasted and a great tendency toward injury being the only consequences of their being retained. In shipping the same result is manifested, and short-horned cattle can be transported at less expense and with less risk than the older and now antiquated types.

The idea still prevails that in certain districts the long horned, shaggy coated steer does better than the animal of higher grade. Where doctors differ it is inexpedient to hazard an opinion, but it is sufficient to assert that in these last days of the nineteenth century, the general conditions are such that while there is little money in raising the so-called inferior grades, there is good money to be made out of better bred cattle, and that to a greater extent the shorter the horn, the larger the emolument. The cattle imported into this country during the seventeenth century were of various grades. The Pilgrim Fathers brought with them a number of South of England cows with different characteristics and qualities. The early records of New England speak of the rapid increase in the number of cattle, and in 1627 a writer gave some description of the cattle to be found in what was then the only settled region of this continent. He speaks of them as consisting of blacks, black and whites and brindles, which would seem to indicate that importation had been heavy both from England and the Netherlands. In 1625, as mentioned in a preceding chapter, the Dutch West Indian Company imported a large number of Dutch cattle from Holland, but as far as can be ascertained from existing records, these animals differed very much from the Dutch cattle of to-day, although in some respects they were evidently somewhat similar. Certain it is that they brought with them comparatively short horns and thick bodies, capable of putting on an immense quantity of flesh. Two hundred years later Dutch cattle were imported much more freely, and the influence of the more recent importations has been very freely felt. These Dutch cattle are probably the result of more careful breeding up than any other in existence, with the possible exception of the regular short horn. Prof. Hengerfeld, of Utrecht, says of this breed:

"It may be taken for granted that the Dutch cattle trace their pedigree from the time when the Friesians and Batavians settled on the banks of our great rivers, about one hundred years before our era; they are the lineal descendants of that race of cattle. These nations were engaged in fishing and attending their herds when not compelled to serve under the Roman standards. The nature of the soil at once indicated their system of agriculture, which was very plain and rude, their object being to get as much milk and beef as possible, while the hides of their cattle were used for garments. Under the Romans, who could boast of a more regular system of husbandry, they improved their farms and the feeding and management of their cattle. These improvements were entirely founded upon the Roman system. Several large farm houses remain at the present time as evidences of that ancient system. The old castle, with its various stables, was surrounded by kitchen gardens, woods, meadows, orchards, duck ponds, moats, canals and ditches, by farm houses with their cow houses and barns, while the whole was enclosed when possible with some branch of a river.

"This is a picture of an ancient Roman villa, with its surroundings. It is true, from that time up to the present, many changes have been effected and the estates are less extensive, but in the main



CHEMICAL DIPPING PROCESS FOR THE PREVENTION OF FEVER, AS USED IN SOUTH TEXAS

(For description, see page 199.)

everything shows an exact imitation of the Roman villa. Observing these things, we conclude that during many centuries the loading, management, and methods of turning cattle to good account, have undergone little, if any, change. A continual crossing of the same breed, with little importation, or mixing with foreign animals, causes the original race to remain unaffected by foreign influence. Only in the northeastern and in the southeastern borders of our country do we meet with crosses of the German and Flemish cattle."

Most of the Dutch cattle imported into this country two hundred and fifty years ago were white, or white and spotted. Their horns were generally curved upward, and were quite short, although not perhaps so short as what is considered strictly the proper thing to-day. Dutch cattle were recommended at that time chiefly because of their exceptional milking properties. Early records show that they also brought with them a high reputation for size and weight. Many of these Dutch cattle have drifted into Texas, and where this has not been the case, direct Dutch blood has found its way South in a less direct manner.

It is difficult to ascertain from authorities exactly when the Shorthorn itself was first introduced into this country. Its history goes back an immense number of years, there being records of the appreciation of this breed in Europe antedating the Norman Conquest; or in other words, prior to the commencement of the eleventh century. They are believed to have been imported into England by the Danes, and certain it is that they made their way rapidly into popular favor. The Old Dominion is mentioned as having received and raised the genuine Shorthorn prior to the commencement of this century, and quite a large number were kept in Virginia and appeared to thrive excellently on the pastures and in the climate of that State. Very early in the present century a number of Kentucky breeders sent agents to Europe and purchased the highest-grade Shorthorn bulls that could be found, and in 1840 there are records of their successful importation into Ohio. In 1850 they went still further West, and before the outbreak of the war they found their way into Texas.

Cattlemen who have given the question very careful attention name the year 1870 as the first one in which methodical importation of Shorthorns into Texas for the purpose of improving the native breed of cattle commenced. From that time forward the experiments have been continued so steadily that they are really experiments no longer. A special characteristic of the Shorthorn sire seems to be to transmit to his progeny his special characteristics, including short legs, immense bodies, and other equally valuable features. The best description of a Shorthorn yet published is the one given by Mr. Allen in his work on "AMERICAN CATTLE BREEDS," and this is reproduced to show how very rapidly the principal characteristics have been transmitted in Texas, and how the Shorthorn has improved the grade of stock kept.

"The muzzle," says Mr. Allen, "should be fine and yellowish, or drab in color, not smoky or black; the face slightly dishing or concave; the eye full and bright; the forehead broad; the horns showing no black except at the tips, and standing wide at the base, short, oval-shaped, spreading gracefully out, and then curving in with a downward inclination, or turning upward with a still further spread (as either form is taken without prejudice to purity of blood in the animal), of a waxy color, and sometimes darker at the tips; the throat clean, without dewlap; the ear sizable, thin, and quickly moving; the neck full, setting well into the shoulders and breast, with a slight pendulous hanging of the skin (not a dewlap) just at the brisket; the shoulders, nearly straight, and wide at the tops; the shoulder-points, or neck-vein, wide and full; the brisket broad, low and projecting well forward, sometimes so much as to almost appear a deformity; the arm gracefully tapering to the knee, and below that a leg of fine bone, ending with a well-rounded foot; the ribs round and full (giving full play to vigorous lungs), and running back well toward the hips; the crops full, but, as a rule, scarcely equal in fullness to the Devons; the chine and back straight from the shoulders to the tail; the hips uncommonly wide, and level with the back and loin; the loin full and level; the rumps wide; the tail set on a level with the back, small and tapering; the thigh full and heavily fleshed; the twist wide; the flank low and full; the hock, or gambrel joint, standing straight (as with the horse), or nearly so; the hind leg, like the fore one, clean and sinewy, and the foot small.

"The true colors of well-bred Shorthorns range from pure white to deep red; and between these colors, either of which frequently comprise the whole animal, their intermixtures in all variations of

roan—as light roan, with the white predominating over the red; red roan, with the red prevailing over the white, as either may over the other in different degrees; red and white flecked, or spotted in every possible way. The red may also vary in shade from light, or yellow red into the deepest mahogany. The old-fashioned Shorthorns sometimes showed a drab dun, or fawn color, mixed with white, which we have in some instances seen crop out in one of later days. We have also seen a very few instances of dark-brown roan, almost smoky in shade, among those of excellent quality and unimpeachable pedigree. But the clear white, and full red colors, either by themselves or intermixed in various beautiful and picturesque proportions, are the prevailing colors of our own time."

Shorthorns have the reputation of being the best milkers known; but it is rather as beef producers that they are popular with Texans. All authorities agree that no breed has a greater capacity for putting on flesh than the Shorthorn, and experience in Texas has proved that the first cross between Shorthorn and native cattle will weigh at least 200 pounds more than a native steer at the same age, with the same amount of food. Careful inquiry among a number of ranch owners, who have gone to the expense of importing or purchasing cattle of this variety, indicate that steers at three and a half years average in weight from thirteen to fifteen hundred pounds, according to the amount of Shorthorn blood in them, and the conditions under which they have been raised and fed. This is a gain of from twenty to twenty-five per cent: and an additional advantage in favor of this breed is found to be that it matures very early for slaughtering, and also that it thrives equally well on abundant grass as on stall feeding.

The Polled Angus was introduced into Texas shortly before the Polled Durham. The Polled Angus is a much older variety of cattle. Twenty years ago it was acclimated in Kansas by Mr. Grant, whose name is so honorably connected with the improvement of the cattle of the West and Southwest. The extraordinary success which attended his experiments resulted in a very general importation of these splendid animals, which have for many years been exceedingly popular in Great Britain and Scotland, and where they have made their influence felt in a most significant manner. Mr. George W. Curtis attributes to Mr. Hugh Watson, of Keillor, Scotland, the credit for inaugurating the movement which has resulted in the general improvement and grading up of this choice breed of cattle. Its predominating color is the blackness of the night. According to Mr. Curtis, Mr. Watson commenced his work almost with the present century. Selecting the blackest of the black, and the best of the best, he commenced to breed for points, and every generation carefully excluded every animal which showed a tendency to revert to inferior characteristics, or which did not please him in every detail. Desiring an animal which would range well, and keep in good condition on exclusive grass feed, he laid this down as one of the characteristics to be sought after, and before he had completed his work he had established a standard of excellence which it would be very difficult indeed to improve upon.

Prejudice was created against this breed about twenty years after Mr. Watson commenced his efforts, but fortunately a reaction set in and the popularity has continued to increase ever since.

The Earl of Airlie, who is an enthusiast on the question of cattle raising, has placed himself on record concerning this breed, in the following terse narrative and personal experience:

"I have at present seventeen pure Polled Angus milch cows in my dairy. The greatest number of these give from twelve to fourteen, and sometimes sixteen, Scotch pints for a considerable time after calving. The milk is admitted to be much richer than that of either the Shorthorn or the Ayrshire. As regards the length of time for which they will continue to give milk, my cow Belle of Airlie (1,959), dam of Bellus (749), as pure a Polled animal as any in the herd book, used to be milked all the year round. Last year, when I was from home, they left off milking her about a month before she calved, and she died of milk fever, induced, as I believe, by the circumstance that she had not been relieved of her superabundant milk. The cow Miss M'Pherson (1,252), of the Erica tribe, which I purchased recently of Mr. Adamson, is now giving six Scotch pints a day, more than nine and a half months after calving. The dairy cows referred to were selected by me with a view to their milking qualities; and whenever I found the produce turn out bad milkers, I drafted and fed them for the butcher, except in a few instances, when, from their shapes and blood, I thought them likely to produce a valuable tribe of cattle."

We have already spoken of the early experiences with these cattle, and it was within ten years of their establishing themselves on American soil that they became introduced to anything like a general extent into Texas. As to whether they have become popular in the great Lone Star State, the color of the cattle on the pastures and in the stalls is the best exponent. As the visitor to Texas or the Indian Territory is whirled across the country in the cars, he occasionally observes grazing near the track large coal-black cattle, absolutely hornless. The animals differ so materially in blood and appearance from the native herds that no difficulty whatever is experienced in detecting their presence, and even the first cross has such a marked effect on color, texture of the hair, length of hair and general formation, that if the good work could be left in that stage, nearly all that could be desired would have been accomplished. But it is a law of nature that there must either be advance or retrogression, and hence it is that Polled Angus Texas cattle must either be steadily bred up to the Polled Angus standard, or they will, in the natural course of events, degenerate and reproduce in more distinct fashion, in every generation, the long horned, shaggy wool characteristics of the old Spanish type.

It has been stated with considerable force and repetition that the Polled Angus does not acclimatize well in what has been described as the Southern fever belt, an expression to which the Texas cattlemen naturally take exception. It is obvious that a breed of cattle coming from the mountainous regions of Scotland requires exceptional care when introduced into a flat country; but experience has shown that with care, and by taking the precautions already referred to, the Angus can be thoroughly acclimated to Texas with but a reasonable percentage of loss in the original importations. The Galloway, which resembles the Angus in color but differs from it in other important respects, takes to Texas more readily. It is scarcely so suitable, however, for breeding up cattle of a Spanish type, because it has a natural tendency to shaggy hair, and when bred with native cattle this objectionable feature, which can be overcome in pure breeding, is apt to make itself very apparent. The Galloway, like the Angus, is pure black, but the long, shaggy hair of the former has about it a brownish tint which is entirely absent in the Angus, whose color is glossy black. The hair of the Angus is exceptionally short and lies very closely, giving to the animal a symmetrical appearance and bringing out prominently all the magnificent features of its build and frame.

The Angus attains to a large size, frequently exceeding two thousand pounds, and the result of a first cross with Texas cattle has been an average increase in weight of more than a hundred pounds at three or four years. The second and third generations show an immense improvement upon this, and where breeding up with this variety of cattle has been persevered in, the general improvement has often been much more marked. Not the least important point of excellence resulting from this cross is the rapid extermination of the horn. Neither the Galloway nor the Angus has even the suspicion of a horn, or the hard bony substance which is frequently found in animals which have been dehorned by breeding and not by aid of the saw or other tool. A number of breeders who were questioned on this subject, expressed the opinion that the Angus was by long odds the most suitable animal to use for improving native Texas cattle, and although it is difficult to state definitely why this is the case, it is safe to assert that although some of the early experiments with this breed proved very costly, the result in every case has justified the attempt. Texas cattle raisers as a rule do not breed for what may be termed "show points," but rather strive for those characteristics which tend to make cattle-raising more profitable, such as early maturing, increase in the weight without corresponding increase in feed, and general healthiness and hardiness. Hence it is that a great many experiments are tried which would not be regarded as strictly legitimate by those who make a specialty of strictly pure blood in cattle, and these experiments have been generally, if not uniformly, successful in herds where Polled Angus blood either predominates, or is present in sufficient force to make its influence plainly felt.

During the last ten or twelve years a still further advance has been made in the way of introduction of specially suitable blood for the improvement of Texas cattle, by the importation of several Polled Durhams. This is a very much younger variety of cattle, and is really a member of the short-horned variety. It is only during the last five or six years that the breed has been recognized as a distinct one, but there are now certain well-defined points in regard to it which make it even preferable to the Shorthorns for the purpose under discussion. Unlike the Shorthorn proper, it is, to a great extent, an American production. It is, in fact, the result of a cross between the best imported Shorthorn bulls

and native cows. The latter were mostly selected from herds in the central and semi-Southern States, and the work was persevered in until what may be termed an entirely new breed of cattle was established.

The Polled Durham is found at its best in Ohio and Illinois, where it is bred for points. It has climatized well in Texas, and in eight or ten different counties it has been introduced with great success. The main point in which the Polled Durham differs from the Shorthorn is in the fact that it is absolutely hornless. In general characteristics it resembles the Shorthorn, and is fully as large as the best breeds of that justly-prized variety. Several bulls have turned the scale at 2,300 and 2,350 pounds, and the cows vary in weight from 1,200 to nearly 1,700 pounds. There is no tendency whatever to the production of horns, and this increases the symmetry of the head and the rotund appearance of the neck. The legs are short, thickset and sufficiently far apart to enable the immense weight of the body to be carried steadily, and without any of the unsteady motion in walking which is so often the case in cattle of the lower grade, which are abnormally fat and heavy. The body is almost perfectly round in the matured, well-conditioned Polled Durham, and the shoulders are exceptionally powerful in both sexes. Being in themselves the result of a cross between imported and American

A MODEL HEREFORD.

cattle, they cross with great advantage with high-grade Texas cows, and indeed some of the best bred-up cattle on the Texas plains possess many of the Polled Durham points, so much so, indeed, that in one generation of interbreeding an almost perfect Polled Durham is produced.

A journey through Texas, such as was taken by the writer more than once while preparing this history and collecting information, discloses the fact that the Polled Durham, in spite of its youth, has made its influence felt to an exceptional extent in a great variety of localities, and that it is drawing attention in a most satisfactory manner to the value, and indeed necessity, of not depending entirely upon the native or Spanish grade of cattle.

Mr. Walter B. Stevens, in the course of his exceedingly interesting and instructive series of letters on Texas, contributed to the "ST. LOUIS GLOBE-DEMOCRAT," describes the herd of Galloways which he saw on the famous Sanborn ranch. Weaving an historical romance around this ranch, Mr. Stevens explains how Mr. Henry B. Sanborn, of New York, located in Texas in 1875 for the purpose of introducing barb wire of a special brand. Becoming infected with Texas fever of a different character from that described elsewhere in this work, the New York gentleman purchased a small tract of land, and kept on adding to his ranch until it exceeded ten thousand acres in extent. Not long after taking up with this new enterprise, Mr. Sanborn secured some pure bred Galloways, described by the writer

already quoted as "short legged, long hair, black as the wax soil after a wetting, hornless, shaggy headed." Supt. Shero of this ranch is quoted as saying: "The Shorthorn will get discouraged when the season is bad. He must be helped out with a little feed. The Hereford will hump up and lose flesh when the cold strikes him. But the Galloway will keep going and hunting something to eat. After the hard season the weaker of these herds will get down in the mud sometimes, and won't have ambition enough to get up again without help. You never see a Galloway get in that fix; he is always able to take care of himself. That is one of the big points in his favor for Texas." Mr. Stevens goes on to write in his usual entertaining manner. "On the Sanborn ranch black cattle are not raised for beef. The strain is too fine and expensive. Thoroughbred Galloways are grown and sold to head the herds of Shorthorns and Herefords on other ranches. The cross gives the breed which finds its way into market. It produces an animal with finer hair, longer legs and greater weight than the Galloway, but the strength of the strain shows itself in the black hide and the hornless head.

"The short legs and big bodies make the Galloway the most deceptive looking of 'cow brutes.' On the Sanborn place it is very easy to get a bet on the weight of a given Galloway, and it is easier to lose it. Once upon a time Dr. Grant, of Sherman, a man with a fund of information on Texas horses and Texas cattle, encountered the deception. He had a dispute with Mr. Sanborn about the weight of a young Galloway they had been looking at.

"'I'll bet you a hat you can't guess the weight of that brute within three hundred pounds,' said Mr. Sanborn.

"The Doctor smiled sarcastically, looked the Galloway up and down and from end to end. 'Six hundred pounds,' he said.

"That evening the bet came up for further discussion at the house. Supt. Shero, when he heard of it, said to the doctor: 'I'd like to bet a hat that it is a bad bet, Doctor.'

"Dr. Grant tapped his thinker, and with increased sarcasm, said: 'This head might be found in a penitentiary, but never in an asylum.'

"The boys were told to cut out the particular Galloway and get him on the scales. He weighed eleven hundred and thirty pounds. Dr. Grant looked at the indicator and then at the brute. 'I wouldn't have believed there could have been so much meat in that much hide,' he said.

"When the artist caught the Galloways for the illustration, they were bunched together so closely that their sides rubbed. The bunch was making the double motion of the funnel-shaped cloud. The individual brutes were moving round and round in a close circle, and the bunch itself was drifting slowly along the wire fence, all grazing.

"'You'll have to get 'em quick,' said Mr. Shero from his horse, 'or they'll be off,' and so the drifting, and at the same time revolving, bunch was caught on the double movement, with heads and bodies and tails all mixed up. 'That's the way those brutes feed; close together, just as you see 'em,' Mr. Shero explained. There is no other cow native on the broad Texas prairies quite like the Galloway. The Polled Angus are somewhat like the Galloways in appearance. They are black and hornless, but they have longer legs, finer hair and more range of body. That is where the Durham blood comes in. Mr. Sanborn says the Polled Angus is a breed made originally by crossing the Galloway and the Durham. The Galloway thus described is of very old breed, its history extending back into the early part of the sixteenth century. In the section of Scotland from which they took their name there is a legend extant that there never was a time when this characteristic breed was not found in considerable numbers in Southwest Scotland. It is interesting to know that in these descriptions, now nearly three hundred years old, the main features of the breed are described almost in the same words as used now. Although the animal has steadily improved during the last two centuries, the improvements have been steady rather than spasmodic or essential. The original color was dun or drab, and although at the present time, and indeed as far back as can be remembered, black is a prevailing color, there is an occasional tendency to lapse back into what was probably the original color."

The Galloway is essentially a hornless beast. Even the mark of a horn is regarded as a disqualification in a contest for points. The color, as already mentioned, must be black, although a brownish tinge is unavoidable in extreme winter. The head is short, with a full forehead and wide nostrils, and

the body is round and long, with the back as straight as a well-planed board, the proportion of live weight very high, and as range stock the Galloways are without superiors for hardihood and ease of handling.

So strong is the anti-horn tendency that the introduction of Galloway blood into herds of native cattle results in at least four-fifths of the calves being born without horns. The Galloway is also an exceptionally heavy animal, with weights varying from twelve hundred to two thousand pounds. The breed is exceptionally valuable in a number of ways, and it has been found that they acclimatize in Texas very easily indeed. The percentage of loss is small, and the percentage of gain from the introduction of the blood is enormous. These results make the demand for full-blooded Galloways very high, and on many ranches they are bred exclusively for stock purposes.

The Hereford is another animal which has contributed very largely towards the breeding-up of Texas cattle. It is usually of a dark red color, with a white face. So far as horns are concerned, the Hereford is less satisfactory than the Galloway, although it seldom has very long horns. It is the frame of the Hereford which popularizes it among ranch owners. It is, to use Mr. Curtis' description, "blocky, square built, with rather short legs, and all back points full rounded. The tail drops squarely, the quarters are heavy, muscular and low down on the hocks, and the head and neck are short and close fleshed; in fact, the whole make-up of the animal indicates strongly the mark characteristic of the beef-breed."

The Hereford was first introduced into this country about eighty years ago, and Kentucky was the first State in which it was located. A few years later large importations were made into Eastern States, and during the last ten or fifteen years, several hundred highly-bred Herefords have been located in the Pan Handle. Large numbers have also been placed on the irrigated lands of Arizona, and unique success has attended the efforts of importers and breeders.

In some respects the Jersey cow does not commend itself to the Texas ranchmen, because it is rather for its dairy than its beef excellency that this aborigine of the islands in the English Channel is celebrated. At one time there was practically no distinction between the Jersey, Guernsey and Alderney breeds, but during the last half century they have been absolutely divided, and now the characteristics are very different. The influence of the Jersey on softening the hard lines of the original Texas steer has been marked. Strange to say, the Jersey is a very distantly removed cousin of the long-horned animal, which used to roam wild over the plains of Mexico and Texas. The same color seems to predominate in the two breeds, and there is also distinct in both the characteristic mealy color ring mark around the nostrils. Mr. Curtis and other authorities attribute this birthmark to Spanish regions, and the short distance between Spain and Jersey makes it exceedingly probable that the Jersey originally came from that once great cattle country.

There is something essentially deer-like about the Jersey. Its neck is thin and long, and its body is deepest at the flank, representing a "V" shape, which, with milkers, very often tends to leanness and fishback form; but with fat steers this is practically done away with. The Jersey does not acclimatize so easily as some other breeds of cattle, but as soon as it is thoroughly introduced it makes its influence felt and becomes of great value. When the vast importance of the dairy interest in Texas becomes to be thoroughly appreciated, those who have gradually introduced Jersey blood into their stock will reap a rich reward for somewhat anticipating public opinion, and flying somewhat in the light of popular sentiment.

It is strange, in view of the obvious advantage of hornless cattle, and of the general tendency toward reducing the length of the horn, that of late years Devons have been more popular for improving the native stock than any other variety of cattle. Hence, the deep-red color so frequently seen in the heavier beasts sent to market. There are hornless Devons, but, as a general rule, the Devons have a longer horn than the average short horn, and this, perhaps, is the only drawback to their general use in Texas for purposes mentioned. On the wide, bleak, and often foggy flat ground of Devonshire, England, and on the wild hills of Wales, these animals have been equally at home, and have stood the variations of soil and climate with marked and remarkable success. On being introduced into Texas they acclimated quicker than any other cattle and speedily became uniquely popular. They were first introduced into this country in 1623, but the first grade Devons came over within the last eighty years.

It is only necessary to give a brief description of the Devon to show the reader how quickly it has stamped its peculiar characteristics on the cattle of Texas. The color is a rich deep red throughout, excepting the central tuft of long white hair in the brush of the tail, and a white spot on the udder in cows, and about the purse in bulls. Upper line almost perfectly straight from the head to the tail; in the bull the neck is, of course, somewhat arched above this level. The head is neat and trim, rather long in the cow, but short and massive in the bull, and well pointed to a well flesh-colored muzzle; eyes prominent, bright, wide apart, and encircled by rings of flesh-colored skin, horns rather long, slender, curving outward, forward and upward, waxy clear at base, and tapering to almost needle-like points of darker shade. The ear is sprightly; neck small at head, without dewlap, and full and broad at the shoulders; forequarters wide apart, showing good lung power, and slanting well back, a feature in strict keeping with their well-known activity. The barrel is round and close-muscled; loins even; hips square; rump smooth; tail long, slender and invariably tipped with white; flank long cut; brisket deep, and legs short, straight and clean-fleshed.

We believe the above to be a just and fair description of the breed as now known in the United States, and to show the improvement which has taken place, we quote the following from "Low's Domestic Animals of Great Britain," previously quoted, and published in 1842.

"Although the Devon ox presents a symmetry of parts which pleases the eye, yet his form is not precisely what the breeder seeks for in an animal destined to fatten quickly and arrive at great weight. His neck is too long, his chest too narrow, his sides are too flat, his limbs too long, in proportion to his body; or, in other words, his body is too small in proportion to his height. The Devon ox is a kindly enough feeder, but he requires good pasture, and a somewhat favorable climate, and could barely subsist on food which would suffice to fatten some of the hardier mountain breeds of nearly his own size."

Probably the most prominent trait of the Devon is his sprightly energy. In the early days of the present century, when the fertile prairies of the Great West held their virgin soil unbroken, the farmers of New England found abundant exercise in removing the stones, stumps and saw logs with which their land was covered. For this purpose oxen were employed almost exclusively, and the grades from those early imported Devons were eagerly sought.

As work oxen, the Devons have no superior in the world; they lack, perhaps, the weight necessary to move enormous loads, but their remarkable quickness, combined with an intelligent observance of the driver's will, make them invaluable for work of certain kinds. For beef, little recommendation is needed; the improvement of the breed has with many breeders, been almost entirely in this direction. Allen, speaking of the excellent milk qualities of the cows in a herd of Devons owned by him, says:

"It is but fair, however, to state that after we commenced crossing our cows with bulls of later importation some fifteen years after the commencement of the herd, the large milkers were not so numerous, although the cattle from these crosses were somewhat finer. The bulls we used were apparently bred from stocks highly improved with an effort more to develop their feeding properties than for the dairy."

"The Devons," concludes Mr. Curtis' description, "are probably as nearly general purpose animals as may be found among the present known breeds. In size, the medium bulls, when matured, weigh from twelve hundred to sixteen hundred pounds, and cows from nine hundred to eleven hundred pounds. One thing more we must notice—their introduction into the Southern States. In Mr. Allen's work, the author intimates that the Devon acclimates unusually well in the South. We cannot agree with him. Information from various portions of the South has shown a high proportion of mortality among Devons brought from the North, only one breed (Shorthorns) showing a greater average per cent of loss. To counterbalance this, however, it is a well-known fact that the Devons when acclimated will thrive and keep in good condition on scant pasture, where many other improved breeds would starve to death. This high per cent of mortality in acclimating Devons may be due to the unnatural forcing which the breed has undergone of late years in the hands of unskillful breeders, as it is well known among successful importers of Northern cattle that the introduction of overfed or pampered stock from the North is apt to result fatally to both profits and cattle. There are now a good number of fine herds of Devons in the South, and their certain increase, both in numbers and favor, is fast becoming an accomplished fact."

The writer's observations, backed up by the opinions of at least a score of prominent breeders, go to show that so far as acclimating is concerned, Mr. Allen is right and Mr. Curtis wrong. Of course, there have been heavy losses on certain ranches, but these have been the exception, and not the rule.

Although, as already stated, the improvement in the grade of cattle raised and fatted in Texas has been most marked during the last ten or fifteen years, it is interesting to note that a quarter of a century ago the importance of the question was realized by some breeders and raisers. In the biographical section of this work, credit is given to a number of individual cattlemen whose enterprise and foresight resulted in pecuniary benefit to themselves and a vast increase in the value of their herd. Mr. McCoy, writing more than twenty years ago, when almost every well bred beast was called a Shorthorn or a Durham in the Southwest, says:

"The Durham or short horn cattle raised and fed so extensively and profitably throughout the Northwest, are in almost every respect more valuable and profitable stock than the long horned to breed and handle. The Durham blood is sought by breeders, and of late years shrewd enterprising Texan ranchmen have been sending young graded Durham bulls to their ranches for the purpose of improving their stocks in blood and quality. They plainly see that Texas must improve her cattle in blood and quality if she would longer compete successfully and profitably in the beef markets of the Union. It is beginning to dawn upon the understanding of the Lone Star ranchman that his only hope, as well as imperative duty toward himself, lies in improving the blood of his stock, even at the expense of numbers.

"While it is a well established fact that Texan cattle can be fatted upon corn, yet it is not so easily or successfully done as with the Durham, although it is quite as well established that Texan cattle will fatten better on grass than the native or short horn. Now, inasmuch as corn-fed and corn-fatted beef invariably brings better prices than the grass-fatted, it becomes a matter worthy of note to the producer, to secure such grades of cattle as will make the most valuable beef. It is also an item worthy of consideration to the ranchman, to breed that class or grade of cattle which the corn feeder desires, and for which he will always pay good prices.

"In Colorado it is made, by statute, a punishable offense to permit a Texan, or scrub bull, to run at large, and ranchmen are authorized to shoot down such whenever and wherever they may meet them upon the commons. This law, in connection with the private enterprise of her ranchmen, is fast changing the form and appearance of Colorado native cattle. Indeed, it is astonishing, as well as highly encouraging, to note the marked improvement in color, form and weight, arising from a cross of Texan cows with Durham bulls, although the latter may be common grades only. In many instances the ordinary observer will scarcely believe, or recognize that the cross, or half-breed, has any Texan blood in it. But little trace of the mother is transmitted to her offspring, which sell upon the Eastern markets quite as well as other Durham grades of equal fatness bred in the Northwest.

"There is nothing else which holds out the hope and sure promise of so great reward for the investment to Texan ranchmen, as the crossing of their cows with grade Durham bulls. If the cattlemen of that State would import one car load of yearling bulls, of Durham blood, for each one thousand head of cattle they export annually, the lapse of time would be brief before a marked difference would be seen in the quality of their stock and the prices realized for Texan cattle. It is to be hoped that the ranchmen of that State will speedily realize the importance of improvement in blood of their herds.

"The great number of Texan cows and heifers that have been placed upon ranches throughout the West, coupled with the irrepressible desire for improvement, has given considerable impetus to the breeding of thoroughbred and grade bulls throughout the Northwest, and especially in the country adjacent to Kansas City. The interest in thoroughbred Shorthorn cattle continually increases, as is plainly indicated by the sales that have occurred during the year of 1873. The demand from Colorado and Western Kansas for superior bulls has been, and still is, large."

Mr. McCoy attributes special credit for the introduction of Shorthorn cattle into the Southwest to Mr. Andrew Wilson, of Kingsville, Kansas. At the time he wrote his "SKETCHES OF THE CATTLE TRADE," Mr. Wilson had an exceptionally large herd of graded stock. He had taken a large number of first premiums at Kansas State fairs, and as a successful breeder of pure blood cattle, he had established a high and enviable record. During the summer of 1873 Mr. Wilson's herd became so large

that a public sale was determined upon, and the amount received in two days was twenty-four thousand dollars, some animals fetching more than a thousand dollars each. "This result, says the author already quoted, "caused so great and growing a demand for blooded bulls to be placed upon cattle ranches in Texas and the Indian Territory that the business of producing full bloods and grades is becoming (1873) very large and lucrative."

Since this was written the value of blooded stock has increased enormously, and those who anticipated the demand have made an immense amount of money as a result of their enterprise. Mr. McCoy's description of the way Mr. Wilson conducted his operations twenty-two and twenty-three years ago shows, that during the winter of 1872 and 1873, he "roughed about five thousand head of Texas cattle through the winter, and fatted them the following summer on grass. Not content with the magnitude of this operation, the following fall season he formed new business alliances, bought seven thousand five hundred head of Texas cattle at panic prices and put them into winter quarters near Topeka. His chosen method of handling Texan cattle is to winter them principally upon corn-stalk fields, which he buys in great abundance at low prices, usually from twenty to fifty cents per acre, after the corn has been gathered therefrom. Upon these fields the cattle are turned in herds of one to five hundred head. As soon as one field is depastured, another is provided, so that the labor of feeding or caring for the

A TEXAS JERSEY BULL.

stock is small and light. When the approach of spring is near, it is found to be good practice to feed corn for several weeks, so as to strengthen up the stock and start it to improving in flesh and heart, so that when the new grass comes in the spring the cattle fatten rapidly and without delay, or loss from death, as is often the case when the animal is poor and weak in flesh. This style, or manner of wintering cattle, is called 'roughing,' and the feeding of corn in the spring is termed 'warming up.' It is one of the most successful and profitable methods of handling Texan cattle. Inasmuch as little or no loss by death ever occurs it is economical—especially when the corn crop of the region has been good, and, as a natural result, the stock fields abundant, good and cheap. It is claimed that by roughing through the winter, the cattle can be made fat upon grass at an earlier date, and be ready to go to an earlier and better market than by any other method of wintering. In Central Kansas by far the larger portion of the corn crops are harvested by husking, or snapping the corn from the stalk, leaving the immatured ears or nubbins on the stalks with the fodder. These make good feed for the stock-steer, upon which he thrives so nicely, so long as he is able to get sufficient thereof. When spring comes and the natural grasses become abundant, the cattle are taken from their winter quarters, and in herds of five hundred or less, are herded until fat, which requires from two to five months' time. Cows and young cattle get fat much quicker than aged steers. A great gain both in weight and value is thus secured."

Even earlier than this, isolated instances of the importation of high-grade stock are recorded. Mr. Kuykendall, from whose reminiscences we have already quoted at some length, says that during the first part of the war he received his first object lesson in the great superiority of the improved breeds over the native scrub stock. "In the adjoining stalls to which my cattle had been assigned on sale," he writes, "were placed an assignment of stall-fed high-grade Shorthorn beeves—magnificent specimens of the bovine race. I stood by during the progress of the sale, an attentive and deeply interested observer. My cattle brought from $17 to $24 per head gross, while the Shorthorns brought the handsome figures of from $80 to $125. This practical demonstration of the value of improved blood made a lasting impression on my mind, and offered an irrefutable argument against the inexcusable folly of breeding scrub stock."

Times change, we are told again and again, but the logic of high-grade cattle as against "scrub" stock remains the same to-day as the observant writer we quote noted it nearly thirty-four years ago.

We have seen, in brief, the characteristics of the principal breeds used during the last quarter of a century, and more especially during the last ten or twelve years, for the purpose of improving the breed of so-called Texas cattle. The name has not changed, but the appearance of the average beast sent to market has been almost metamorphosed. We have seen, in outline, how the results have been achieved, and how the long dangerous horn has been relegated to obscurity, its place at the worst being taken by a horn so reduced in size as to be comparatively innocuous.

To gather anything like an adequate idea of the results achieved, one must look over the ground both at the points of feeding and raising, and of selling. He must then cast his mind back a few years and contemplate the difference and the advance. Or he can spend a few hours at the stock yards of either Chicago, St. Louis or Kansas City. When a bunch of unhappy-looking animals, short in weight but long in horn, makes its appearance, he will be told by the habitue of the place that they are from the extreme South of Texas, where there has been little or no change in the grade of cattle. When, a moment later, a bunch of heavier, shorter-horned beeves make their appearance, he learns an object lesson in the effects of breeding-up, and if he cares to follow the question a step farther, he learns that the latter bunch sell quickly at about fifty per cent higher prices than those at which the long-horned rough-coated antediluvian animals go begging, perhaps for a day or more.

As a matter of fact, the advantages of breeding-up are so great that they can scarcely be reduced to the region of dollars or cents. Nor can it be said the investment of the importers is bread cast upon the waters to return after many days. The paramount importance of producing a higher grade of beef is being fully recognized, and even were the present the one time to be considered, the importance of the introduction of better blood would be easily appreciated. A contributor to one of the Eastern papers, following this subject up, says with much force: "Unfortunately, the butchers have not yet sufficiently divided their customers into two classes, and they consequently mix them. It is largely a lottery to go to a butcher and expect to get good meat. He has in stock good, bad and indifferent meat. He sometimes does not take the trouble to notice which is tender and which is tough. The buyer pays as much for one as for the other. Probably in many cases the retail butcher has done the same. There are no doubt many poor people in the cities who would buy more tough meat if it were cheaper, and many well-to-do classes who are anxious to get meat that is guaranteed at all times to be tender and juicy. The present mixed-up state of affairs does not do justice either to the consumer or to the grower of meat. The former should insist more decidedly upon good meat, and if it is not given, refuse to pay the full price for it. In this way we would soon have a class of butchers who would deal only in superior beef. Their customers would take nothing else. The poorer customers would be benefited by this, because their tough meat would be proportionately cheaper. In the wholesale markets, poor Texas cows sell as low as one dollar and twenty-five cents and two dollars per hundred pounds, and extra, well-fattened, tender steers, vary from four dollars and fifty cents to five dollars. When these separate beeves are placed upon the market, the prices at retail should be proportionately different. Too often they are just about the same, the price for the extra steers often governing the retail prices for both.

"At present there is a great impetus among farmers and stock raisers to produce extra fine beeves for market, and it is only their just due that higher prices should be paid for them. It is no attraction

for them to spend their time and labor upon the animals if they are to come in competition with poor native scrubs from Texas. During the last ten years we find a great improvement in the quality of most beeves sent to market, and it seems about time for the farmers and breeders to combine to offset the pernicious system followed by many retail dealers. The consumers lay all the blame to the raisers, but in reality their butchers are at fault. They are imposing upon their customers by selling them two dollar beeves for five dollar ones. They may not serve one customer continuously in this way, but give enough good meat along with the tough kind so as to create the impression that it is a lottery with them. They buy the meat, and if it is tough there is no remedy for it, and if it is sweet and tender so much the better for the purchaser. The animal is lucky, thus speedily rectifying this, and the day is not distant when there will be little or no sale of inferior or lean stock at all."

The writer of this section of the story of the cattle industry, was much struck while making investigations as to the introduction of high grade stock into Texas, with the decadence of the horn during the last quarter of the nineteenth century. Horns on cattle are now regarded as a nuisance, and their removal is greatly to be desired. Nature has a wonderful way of adjusting matters, and furnished the original Texas steer with long horns in order that it could fight against its natural enemies on the ranch, and even protect itself from aggressive members of its own kind. To be more accurate, it was probable that the long horn was the survival of the fittest, being indeed the one breed of cattle which could withstand the countless difficulties to be met with in pioneer days. But at the present time the horn as a weapon of offense is exceedingly objectionable, as many a sadder and sorer tenderfoot has learned, and as a weapon of defense it is absolutely unnecessary. Cattle frequently injure each other unintentionally with their horns, and, moreover, a great deal of space is wasted by these excrescences. Now that stall feeding is gaining ground in Texas, the value of space is being felt materially. It is estimated that there are nearly half a million cattle now being fattened in the Southwest on cotton-seed meal, and it is possible that the number is much larger than the one given. Hornless steers can be housed with much greater economy, and it is also found that two or three more beasts can be placed in a car with less difficulty or danger when hornless than with horns.

Dehorning at one time looked as though it was going to become quite general in Texas, but the practice is less popular than was expected. It has been found that horns can be removed with comparative ease, and various patents have been introduced from time to time for facilitating the process. It has often been argued that, when the operation has been performed on calves, the horns can be removed without involving much suffering to the animal. There is, however, a great deal to be said against as well as in favor of sawing off the horns. Statistics go to show that, with cows, dehorning causes a temporary shrinkage of milk, but that this effect is only temporary. There is a percentage of loss from the operation which is open to the objection that it has to be repeated generation after generation. The Texas cattleman has often been written up as cruel and heedless in regard to inflicting pain on his stock. It is significant, in view of these criticisms, that for every man that gets rid of the horns on his steers by means of saw and other tools, at least five or six expend hundreds if not thousands of dollars in introducing the blood of hornless varieties, and thus gradually removing the objectionable articles by a more costly but much more merciful, and, of course, permanent process.

A well-known cattle commission man says on this branch of the subject: "With the introduction of black muley cattle from Europe into this country, it has become quite a custom among feeders to dehorn their cattle, or when purchasing the same for feeding purposes in the markets, nearly all well-informed feeders will require their cattle dehorned, and will pay from one to two dollars and a half per head more for a nice lot of muley or dehorned beeves than they will pay for cattle with their horns on."

This condition of affairs has become well known to feeders, and has caused farmers to undertake to dehorn all their cattle, and this, like everything else attempted by inexperienced men, is very badly botched in the majority of instances. It is a very small matter to dehorn a calf or a yearling and to do a nice job by simply removing the small young horn from the head with a sharp knife, which can easily be done and without much difficulty. But the practice of dehorning aged cattle, cutting the horns from a distance only from a half to an inch from the head, is folly of the worst kind. It is not only barbarous and extremely painful to the animal, but it leaves an ill-shaped head and looks like a botched job from beginning to end.

With the present modes of dehorning cattle, there is no reason why even three and four-year-old animals cannot be dehorned without positive injury, by clipping the horns off right at the edge of the hair, and separating them from the bone of the head right down at the roots of the horn. Cattle may be run into a chute, their heads fastened in a socket, and their horns clipped off with a dehorning machine without any difficulty, or without much serious inconvenience to the animal, and they will go right along gaining in flesh, and will not lose a feed from this mode of operations. The way cattle are dehorned sometimes, more especially in the Southwest, where there is a stub of horn left an inch long on the head, is cruel and barbarous, and requires a month or six weeks for him to regain his appetite and get on feed, so that he will commence thriving again. There may be, and probably is, a necessity for cattle to maintain their horns when grazing on the Western prairies and ranges, where they are attacked often by wolves, and where a cow may have to fight for her calf. In such instances it is absolutely necessary for the animal to have horns, and there may be some excuse for branding, as there is done on the Northwestern ranges, with a larger brand and more plainly, and for letting them retain their horns, than there is through other sections of our country.

Thus, one way or another, the horn of the Texas steer has received imperative orders to stand not upon the order of its going, but to go at once. To say that the average length of horn has been cut in two during the last ten or fifteen years, is to understate rather than overstate the case. Four feet was at one time a possible, if not common, length from tip to tip. To-day there are thousands of Texas steers concerning whom it may be said that the horn has been actually eliminated, so as leave not a stump behind, while of tens of thousands more it can be said that all the objectionable and dangerous features have been removed. Where three feet was once not considered excessive, eighteen inches is now considered out of the way, and the tendency is still to shorten. On the few enormous ranches that remain as such, and which resist the barb-wire fence longer than others, little improvement has been effected it is true. But these will fall in line in good time, and before the century is out long-horned Texas steers of the original type will be almost as rare as the buffalo, which used to dispute its right to pasture and range, and which was only exterminated a short generation ahead of it.

MISS ELLA PAXTON, known as the "Cowgirl of the Pan Handle," recently favored an enlightened Western audience with the following original production, which, in her introductory remarks, she styled "paradox" on "Beautiful Snow." She also stated that it was "paradoxed" while sitting on her horse one day, herding on her father's ranch, in the Pan Handle, situated about three miles from Mobeetie, Texas:

Oh, the steer, the beautiful steer,
Kicking the fleas from the point of his ear,
Flapping its tail in its frolicksome glee,
Hopping about like a Snake River flea,
Bellowing!
Roaring!
Thundering along!
Filling the air with its steerical song,
Till the rumble from its lung-laden pits
Scares timid jack rabbits and wolves into fits.
To me there is nothing on earth half so dear,
As the long-horned, slim-bodied Texican steer.

How often I wish that I was a steer,
With a long, shiny horn at the butt of each ear;
With a clear, fearless eye, and a tapering tail
That would flap like a whip in the maddening gale.
How I'd beller!
And roar!
And paw up the ground!
And lope over the hills with thundering sound,
And snort like a terror, and hump up my back
When I saw the wild cowboy pursuing my track—
And I'd laugh at his oaths as he fell to the rear;
Oh, I'd be a Jo-dandy, if I was a steer.

I once roped a beautiful steer—but I fell—
Fell from my pony with ear-piercing yell!
Fell, with the lariat fast to my wrist;
Fell, to be dragged through the grass wet with mist,
Bumping!
Rolling!
Grunting, I went!
A full mile a minute, or I don't want a cent.
The gravel and grass yanked the hide from my nose;
And ruined a pair of forty cent hose;
Aye, even my bustle was thrown out of gear
By the frolicksome freaks of that beautiful steer.

CHAPTER XIII.

The Texas Cattle Raisers' Association and the Work it Has Accomplished.

EVERY one has heard of the old-world philosopher who spent several years of his life in a fruitless search for an absolutely contented man. The story has been told in a variety of forms, but the main feature of it is the fact that after hunting up every alleged contented man of whom he could hear, the philosopher was finally recommended to an aged shepherd who had tended his flocks on the hills for nearly half a century, and who had frequently stated he had never, from infancy, had a wish unfulfilled. The old man was found apparently as contented as rumor alleged, and the philosopher approached him with a confidence born of despair. Seating himself beside the shepherd, the enthusiast entered into conversation with him, and, leading gradually up to the subject, finally asked him if he was absolutely content. Raising his staff and pointing in the direction of the flock of sheep grazing in the valley beneath them, the old man replied that he would be perfectly happy were it not for yonder black sheep, which insisted on straying into his flock, no matter what precautions he took to prevent it.

The truth of this story is doubtful, but its moral is obvious. Localized, it might read that many a Texas cattleman would be approximately, if not absolutely, content, were it not for the cattle stealer, and the man who, while too proud to actually steal, is mean and dishonest enough to take advantage of accidents, and appropriate any cattle which, like the black sheep in the story, persisted in straying on to his ranch.

We have already spoken at some length of that extraordinary art or science known as "maverick-ing" or "rustling." The barb-wire fence, the abolition of free range and the general settling of Texas and the Southwest, have increased the difficulties of the professional rustler. The same influences have also taken away the excuses, often made in years gone by, that cattle were accidentally appropriated, and that it was difficult, as well as expensive, to always distinguish accurately between *meum* and *teum* on the ranch. To-day the retention of cattle belonging to other people is known by its right name, and the retainer is branded as a thief, if not with a hot iron, at least with public opprobrium and disgust.

But there is another agency which has accomplished an inestimable amount of good, if not exactly in teaching certain cattlemen to be honest, in at least increasing the difficulties of dishonesty and respectable theft, if the term may be admitted, even in sarcasm. Reference is made to the Cattle Raisers' Association of Texas, which, during the last seventeen or eighteen years, has worked nobly, and in a most disinterested manner, for the good, not only of its own members, but also of the cattle trade of Texas generally. No review of the live stock interest of Texas and the Southwest, its past history and its present greatness, could be reasonably complete without a review of the work of this organization; hence we have no excuse to offer for recording its transactions at some length. If any other excuse for this chapter of history were necessary, which it certainly is not, the interesting reflex of changed conditions, as shown by the minutes and work of the association, would provide it. When it first commenced operations, free range was general, and its work largely consisted of appointing committees to manage the great annual round-ups, and return to owners or proper ranches all stray or wandering cattle. Gradually this branch of its work came to be, in a measure, superfluous and unnecessary, and to-day the important functions of the association are conducted by means of inspectors, who are stationed at shipping and other points for the purpose of locating stray or stolen cattle, and either returning same to their owners, or selling them and forwarding the proceeds to the treasurer of the association.

It was at Graham, in Young County, Texas, in 1877, that the association now known as the Cattle Raisers' Association of Texas was first conceived. In that town a stock raisers' convention was held on February 15th and 16th of the year named. A large number of prominent cattle raisers had issued a call for a convention for the purpose of discussing common wrongs and grievances, and to either

exterminate the cattle thief, or make his occupation too hazardous and costly to be remunerative. Mr. J. N. Simpson, of Parker County, nominated Mr. C. L. Carter, of Palo Pinto County, Chairman of the Convention, and Mr. J. C. Loving was made Secretary. An interesting discussion with a most instructive interchange of views followed, and it is to be regretted that a shorthand report was not made and preserved of the speeches, as they would be most interesting contributions to Texas history.

The result of the first day's deliberations was the determination to form a permanent organization, and the appointment of a committee to draft resolutions setting forth the aims and objects in view. This committee was composed of Joseph Graham, Sam Glascon, Rowland Johnson, A. B. Medlan, C. B. Brummett, J. T. Webb, George Wright, J. H. Simpson, J. C. Loving, H. G. Bedford, Tom Merrill, John D. Smith, W. B. Slaughter, R. E. Mabry, D. B. Gardner, J. C. Lindsey and C. L. Carter.

These gentlemen met on the evening of February 15th, and, working until late into the night, drafted a series of resolutions which resulted in the formation of what was then known as the Cattle Raisers' Association of Northwestern Texas, a name which was retained until the year 1893, when the more comprehensive title by which it is now known was adopted. The committee's resolution read that the association be named the Stock Raisers' Association of Northwest Texas, and that its officers should consist of a president, vice-president, secretary and assistant secretary, each to hold office for one year. The object of the association was tersely stated in the following words:

"That the members of the association shall work together for the good and common interest of the stock raisers of Northwest Texas, and do all in their power to advance stock interests."

In order to carry on the work, it was recommended that the territory included in the title of the organization be divided into a series of districts, and that members be allotted to each district, whose duty it should be to gather all stray cattle in their districts and notify owners of the same, holding them until the owners claimed them. Although changes in habits and customs and various other details have taken place, the lines of demarkation of these districts are interesting as a matter of history, and we record briefly the boundaries mentioned, giving credit to the men who commenced the work which has since been carried on so successfully, many of whom have since joined the great majority and attended the great final round-up. The first district was defined as commencing at the mouth of Keechie Creek, at its junction with the Brazos River, and running on a line to Cement Mountain; thence south to the Brazos River near the old agency, and down the Brazos River to the point of commencement. Messrs. C. L. Carter, Slaughter Bros., Thomas Scarborough, T. J. Atkinson, Charles Dalton and D. C. Kyle were assigned to the task of looking after this district, gathering in all stray or appropriated cattle and notifying the owners of the same. Messrs. G. G. Milliken, Wilson Bros., B. R. Willett, J. C. Loving, H. G. Bedford and W. C. Hunt were appointed committee in charge of the second district, which commenced at the north corner of No. 1 and ran to the mouth of Lodge Creek in West Fork to its head; thence south to where the telegraph crosses Dry Creek, and east to the point of commencement. It is only necessary to give the line of boundary in the words used eighteen years ago to remind the reader of what vast changes have taken place, not only in the cattle interest, but also in the State of Texas during that period. The idea of describing a point as where "the telegraph crosses" a certain creek strikes the reader in 1895 very strangely, and will take back hundreds of readers in memory to the old days, when it took almost as long to describe a point as to get to it.

The third district commenced at the head of West Fork and ran in a westerly direction to J. Farrar's camp on Slippery Creek; thence up the Little Wichita and down the divide between Deep and Turkey Creeks to the Brazos River, and thence on a direct line to Fort Griffin. This district being exceptionally large and important, was placed in the hands of a very large committee, consisting of the following well-known men: Messrs. J. H. Graham, J. T. Farrar, J. W. Medlan, J. S. and D. W. Godwin, J. D. Smith, E. C. Davis, George Terrell, A. B. Medlan, N. H. Graham, McCommis & Hunt, C. C. Mills, W. B. Mills, John Stevens, T. H. Brummett, R. E. Mabry, Hardisty, Boar & Co., L. L. Clark, Carpenter & Eaton, John W. Proffitt, R. J. Johnson and Wright & Bros.

The fourth district was equally extensive and important. Its boundary commenced at the head of Lodge Creek, running north to Red River Station, up Red River to the mouth of Pease River, south to the head of Beaver Creek; thence on the point of junction between the Buffalo road and the North Fork of

the Wichita and east to Millett's hay camp. Messrs. Waggoner & Son, Harrold Bros., Ikard Bros., Halsell Bros., Curtis Bros., Millett Bros., Stephen & Worsham, Reede & Day, Flippins & Merchant, S. B. Burnett, J. J. Lang, Lute Renshaw, John Dawson, Strong, W. S. Brown, F. M. Goodwin, S. A. Belcher, A. W. Crawford, B. B. Scarborough and Joe Bryant were assigned to this district.

The fifth district was not quite so extensive, and Messrs. W. E. Stewart, Roberts Bros., A. J. and F. M. Long, J. W. Frury, Clayton & Cowen, E. Martin, John Hullum, Carter & Grounds and Couts & Simpson were given the duty of attending to the rest of it. The district comprised all of Jones County and "that portion of Baylor that lies north of the divide between Clear Fork and the Colorado River."

Stephens County comprised the sixth district, to which were assigned Messrs. J. F. Webb, John Hittson, John Millsap, George Gambell, W. S. Dyer, C. L. Wasson, Willis Benson and William Hullum.

These resolutions were adopted at the second day of the Convention at Graham, after which the body adjourned to meet again at Graham on April 10th of the same year for the purpose of completing the scheme. forming a permanent organization and proceeding with active business. At the second

ANOTHER TYPE OF EXCELLENCE.

meeting a very important resolution was adopted. This was, that before any person should drive a herd from his ranch, he be requested to give notice to three of the stockmen who should examine the herd, and if they found any animal belonging to any member of the association or any stock raiser, to be authorized to cut it out and hold it, giving the owner the earliest possible notice. General instructions were also given to watch all trails and ranches, and promptly report any cattle stealing or straying. Arrangements were also made for the publication of full reports of old brands and marks, and the distribution of pamphlets and documents containing these records among cattlemen generally.

The work of permanent organization was completed, Mr. C. L. Carter was made President; Mr. J. D. Smith, Vice-President, and Mr. J. C. Loving, of Jack County, Secretary, with Mr. L. J. Connor, as Assistant Secretary. The President proved himself to be the right man in the right place, and a better selection could hardly have been made. As the records of the association show, "he was a pioneer cattle and frontiersman, having settled in Palo Pinto County in 1855, on the place where he died. He experienced many trials and troubles with hostile Indians, in addition to the heavy loss of property at the hands of these savages; he lost his oldest son, a bright and promising young man, just as he was growing into manhood, while on a cow hunt on his range." It was the good fortune of most of the older members of the association to have known Col. Carter for many years prior to his death. They all are

of the opinion "that no better man ever lived or died; that he possessed many, if not all, of the qualities necessary to make a good man."

He was re-elected year after year, and with the exception of one year, served the association honorably and faithfully until July 1888, when his career of usefulness was brought to a termination, and he went to his account deeply mourned by thousands of men who had learned to appreciate his sterling worth and his noble character.

Mr. J. C. Loving, who was elected Secretary, has held the office continuously, having been re-elected year after year. In 1879 he was elected Treasurer as well as Secretary, and has filled both positions for the last six years. For eight years he has been manager of the protective and detective department of the association. Mr. Loving's work needs no praise. It is conceded by the members of the association that much of its success is due to his patient hard work and exceptional executive ability. He has nursed the association from infancy to maturity, and is perhaps the best posted man on brands, marks and cattle generally, to be found within five hundred miles of Fort Worth, where he makes his headquarters.

Resuming our brief history of the Cattle Raisers' Association of Northwest Texas, as it came to be called after its formal incorporation, it may be mentioned that another meeting was held in August, in 1877, which was adjourned to March 15th, 1878, when Graham was once more the place of meeting. The Chairman reported excellent results of the year's work, and he was re-elected by the association, in spite of his request that some younger man might relieve him. Mr. J. B. Matthews, of Shackleford County, was elected First Vice-President, and Mr. J. R. Stephens, of Clay County, Second Vice-President; Mr. George Wright, of Young County, became Assistant Secretary, and to Mr. J. A. McLaran, of Palo Pinto County, was entrusted the care of the funds of the association.

From the minutes of the meeting, it would appear as though the most important business transacted was the revision of the round-up districts, and also the appointment of superintendents. Four additional districts were added. Number seven included all the country west of Sandy Creek and south of the Griffin and Breckenridge road; up that road to Fort Griffin; thence to the head of Foyle Creek, south to Hazel Wood and Carter's ranch; thence to Belle Plain; thence east to the head of Sandy Creek, with the round-up at Lynch's.

District eight joined numbers five and seven on the west. Its north line included the Matthews and Reed ranch; thence south to Sweetwater Creek, and along that creek to Kyle and Buntings', south to Mountain Pass, and east to Belle Plain, with the round-up at Matthews'.

The ninth district included all of Jack County not embraced in the preceding districts, and that portion of Palo Pinto County, north of the Brazos, not included in district number one.

At about this time Eastern papers were amusing themselves with exceptionally exaggerated statements about the bad men of Texas, about the blood-thirsty cowboys, and about the unruly scenes which took place at the round-ups. The members of the association, while knowing that the majority of these descriptions were overdrawn and regardless of fact, yet realized that there were occasionally grounds for criticism, and accordingly they passed the following resolution, copies of which were extensively circulated:

"WHEREAS, There has heretofore existed much confusion at the different round-ups, brought about by disagreements between outfits sent there.

"*Resolved*, That each owner of cattle send an outfit to a round-up placed in charge of a stockman fully competent to guard the men and to avoid disturbances, and that each outfit carry with it ample provisions in the way of cooking utensils and bedding, or funds with which to purchase the same."

Thus in the early days of the association was influence brought to bear in the direction of law and order. It reads a little out of joint to-day to advise or instruct ranchmen to send cooking utensils and bedding to any place, and the wording of the resolution again indicates somewhat the great difference between conditions as they existed in the seventies and as they are found in the nineties.

In August of 1878 the association met at Fort Griffin, the special business transacted being the fixing of dates for round-ups, and the issuing of general instructions.

On March 10th, 1879, the association was called to order by Chairman Carter, at Henrietta, in Clay County. An immense number of new members were admitted, and the association would appear

to have been established on a much stronger footing than formerly. A great variety of questions were brought before it for discussion. There was debate concerning prairie fires, and on the great losses resulting from the continual burning of grass. Resolutions were adopted calling for the exercising of the greatest possible care, and also for legislation providing for the punishment of any person wilfully or negligently setting fire to grass.

From prairie fires to horse thieves the distance was not great, and the Convention found itself exchanging condolences on the loss of good horses and valuable ranges. A committee was appointed to arrange for the special protection of members against horse thieves. This committee reported recommendations to make each member of the association place its range or horse brand on every horse, and record the brand with the Secretary. It also recommended the offering of a reward of two hundred dollars for the conviction of a horse thief. The recommendations were adopted, and very satisfactory results followed. In this, as in other matters, the association acted promptly, and hence the success obtained.

That the maverick was not entirely a thing of the past in 1879, is proved by the fact that this Convention passed special resolutions concerning the illegal marking and branding of cattle with the intention of depriving the rightful owner of the same. It was decided to offer a reward of fifty dollars for information leading to the conviction of any person guilty of this offense.

Another resolution condemned, in strong language, the practice of driving cattle on established ranges to the injury of owners. In this latter connection it was resolved that if any person opened a farm within the range of any member of the association he be required to erect and maintain a fence around the same. Failing to do this, it was laid down that he must bear the responsibility individually for any loss or damage accruing to him, and that owners of the cattle creating the damage could not be held liable.

The very lengthy and important session came to a termination by the adoption of a memorial to the State Legislature, begging for more stringent laws on the subject of burning prairie grass and hay. An amendment to the law of 1856 was asked, with the infliction of more severe penalties.

The Convention of 1880 was held in March, at Jacksboro. The officers were re-elected with slight exceptions, Mr. C. C. Slaughter becoming Second Vice-President, and Mr. Ikard Assistant Secretary. Communications of importance were read and the large number of round-up instructions issued.

Fort Griffin was the town selected for the Convention in 1881. All the officers were re-elected and a very large batch of members were admitted. A committee was appointed to consider the advisability of incorporating the association under the laws of the State. It was decided to pay a reward of four hundred dollars for the conviction of horse stealers, and a special assessment was ordered to cover the expenses incurred by hunting out the thieves.

A protest was made against the passage of any law for the leasing of the public school grounds of the State, and steps were taken to secure the proper handling of the protest by members of the Legislature. It was further resolved that a large number of cattle belonging to the association being further South than usual, the round-ups should be postponed to a later date than was usually the case. Arrangements were made accordingly and the Convention adjourned.

On March 20, 1882, the association met at Gainesville, and remained in session for three days. The business transacted was exceptionally important and lengthy in character, and the debates were very earnest and at times vigorous. The officers for the preceding year were re-elected by acclamation, and long lists of prominent stockmen were handed in by the membership committee. This was a busy year for the stockmen, and it was decided to increase the number of districts by subdividing some of the original ones. An immense amount of work was reported as having been transacted at the round-ups, and much satisfaction was expressed at the results.

Resolutions were passed making it imperative that a competent boss should attend the round-up and prevent unnecessary roughness, and especially the firing of pistols and general cussedness while cutting out cattle. It was also resolved that each boss must be given absolute power to discharge any man infringing orders as to this matter.

The lease law introduced into the Seventeenth Legislature was discussed, and was very roundly denounced by several orators in the ranks of the members. Resolutions were passed to the effect that

no more legislation was wanted by the cattlemen of Northwest Texas, and that any further changes in the stock laws would be regarded as strictly inimical to their interests. It was further resolved that the sale of the lands of the State in large bodies or tracts to any individual or firm, and especially to alien investors was contrary to the spirit of American free institutions, and was further calculated to establish huge monopolies to the detriment of the best interest of the State of Texas. A committee was appointed to attend the special session of the Legislature at Austin, to impress these views on the members and to protect the interest of stockmen generally.

A large number of claims for rewards for the detection of horse and cattle thieves were considered and allowed, and an assessment per head of cattle owned by the members was determined upon in order that the reward fund should be maintained. The rewards in some instances were largely increased, and a memorial to the sheriffs of the State was adopted, urging those officials to co-operate with the agents of the association in suppressing thefts on the plains and ranches of the State.

A resolution introduced by Mr. Harrold was carried. It dealt with several very important legislative points, and recorded the fact that the association looked with disfavor upon attempted legislation, having for its object in the remotest degree the dictation to any person, whatsoever his avocation might be, in any portion of Texas, and most emphatically protesting against the idea of creating any line of demarkation, imaginary or otherwise, looking to the separation or division geographically of the stock interest of the State. The association further recorded its protest against such legislation, denounced it as uncalled for, unnecessary and unjust, of a character that could not be enforced, and hence calculated to create contempt for the law and its authority.

In the following year, 1883, the association met at Fort Worth, being called to order on March 6th. A committee was appointed to amend the by-laws and to effect such reorganization as was necessary to check the stealing and illegal handling of cattle. Very few changes were made however, and the greater portion of the meeting was devoted to the adopting of additional measures to prevent stealing, and the listening to a most important paper read by Hon. Norman J. Colman, of St. Louis, on the necessity for increasing beef production. Mr. Colman gave a number of statistics on this point, and his speech was listened to with great interest, interrupted by very enthusiastic applauses.

On November 12, 1883, a called meeting was held at Gainesville for the purpose of considering what steps should be taken in view of the changed cattle conditions brought about by the fencing in of large pastures. At this meeting the changed condition of affairs was first thoroughly recognized, and a landmark may be said to have been established in the history of the cattlemen of Texas. It was pointed out that the fencing in of pastures in all parts of the State, and more especially in the Northwestern counties, made a change in the free range system inevitable, and that these changes must be accepted with good grace, and without murmuring. A large number of suggestions and speeches were made, and finally the following resolutions were adopted:

"*Resolved*, That it is the sense of this meeting that a law ought to be passed by the Legislature that will protect all property rights, either in fences, grasses or houses, with a penalty attached to protect such property rights from wanton and malicious destruction.

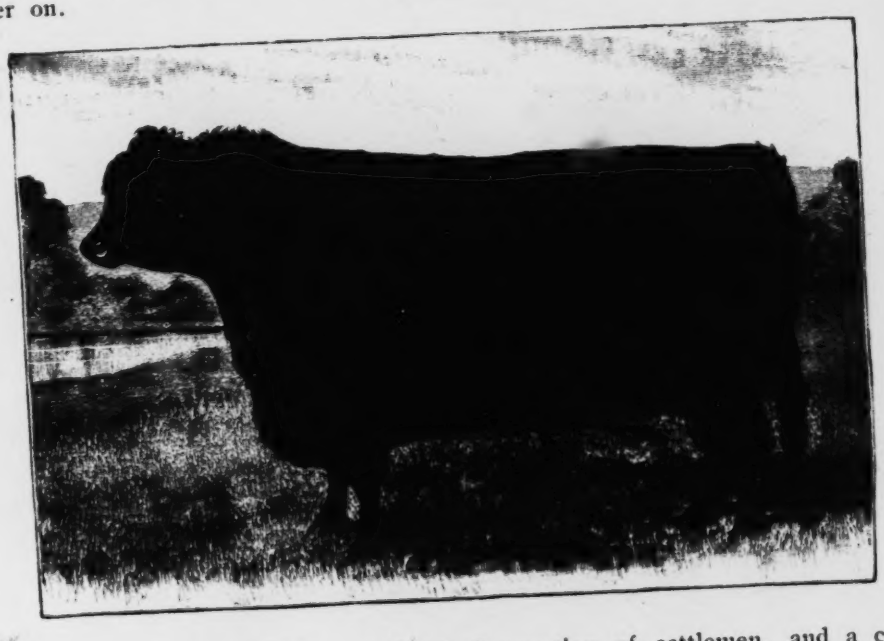
"That all property taxed by the Government is entitled to the same protection, no matter to whom belonging, and whether the property be used for agricultural or grazing purposes.

"That it is the desire of this Convention that the people be provided with all necessary public highways or thoroughfares for first, second or third-class roads, and that each member of the association be required to establish gates at all places and points where the neighborhood roads pass through his pasture; and that any member of this association refusing to comply with this resolution be subject to suspension."

The adoption of these resolutions, eleven years ago, is perhaps the most conclusive answer that can be given to charges that have been made from time to time as to the aggressive and overbearing attitude of cattle feeders and raisers, and their stubborn determination to stand in the way of the inevitable and the impossible. Again and again the public have been told of the monopolies established by so-called cattle barons, of small farmers and ranch owners being crowded out of existence, and of the way in which the rights of the poor have been invaded by the strong arm of the rich. History shows us that in many respects it is the cattlemen who have been encroached upon year after year, and that at

least the better element in the trade have invariably opposed monopoly and labored for the common good of the State as well as for the interest of cattle people. If this history serves no other purpose than to make these facts obvious, it will receive ample justification and accomplish a great and good work.

During the winter of 1883, there was a distinct boom in the cattle stealing business, and when the members of the association met to hold their eighth annual meeting at Dallas, on March 11th, 1884, there was blood in the eyes of a good many of them. The officers were re-elected, and Messrs. F. R. Sherwood and L. P. Cunningham were appointed Assistant Secretaries. After precautions had been taken in regard to keeping diseased cattle out of the State, the cattle-stealing question came up again. Not only was it decided to increase the reward for the conviction of cattle stealers to one thousand dollars, but a distinct departure was made in the policy of the association, by the appointing of detectives and inspectors, and assigning them to various duties, chiefly of a protective character. At this time the general round-up had been abolished, owing to the gradual fencing up of the country, and the necessity for this change in the mode of conducting the association's operations became obvious. That the change has been a very successful and prosperous one, we shall see later on.



A resolution was passed favoring a National Convention of cattlemen, and a committee was appointed to report as to trails for cattle from the Indian Territory. Mr. E. R. Stiff, of Collin County, talked at length on the value of Shorthorns, and the importance of introducing their blood into native herds. A large number of members endorsed the necessity of improving the breed of cattle kept, and it may be said that the general improvement in Texas cattle, as distinguished from prior individual, but unaccountable, effort, dated from this Convention.

A petition to the Legislature was adopted, calling for a law appointing a Sanitary Commissioner and a State Veterinarian, to investigate all statements and charges as to the so-called splenic fever, which, by exaggeration, was injuring the Texas cattle business materially. It was also resolved that all laws as to quarantine, and the driving of cattle from one State into another, should be uniform, and should be impartially enforced by the general government of the United States, which should enact all laws necessary for either the promotion or prohibition of trade, and the handling of live stock between the different States and Territories.

The Concho and Colorado Association concurred in these resolutions, which were placed before the proper authorities, with more or less satisfactory results.

In 1885, Mr. Carter, who had repeatedly asked to resign the Presidency, insisted on his resignation being accepted, in order that he might secure rest from the very arduous duties connected with the office. His resignation was accepted with deep regret. Mr. J. R. Stevens was called to the chair pro tem., and Mr. J. N. Simpson took the floor, and, in a speech of deep feeling, eulogized the retiring President, calling attention to his invaluable services to Texas and the cattlemen, and moved that Mr. Carter be made a life member of the association. Mr. C. C. Slaughter seconded this motion, which was carried by a rising vote. Mr. Slaughter was then elected President, and Mr. Stevens, resigning the First Vice-Presidency, was also made a life member. Mr. J. M. Lindsay was appointed in his place, and Mr. J. F. Evans was made Second Vice-President. Three delegates were nominated to represent the association at the National Convention of Cattlemen to be held at St. Louis the following November.

The Executive Committee appointed at the last meeting reported the best possible results from the change in the policy of the association. A million head of cattle had been inspected; at the different markets 344 stolen or stray cattle had been recovered; 166 had been located and cut out at shipping points; 343 had been found on ranges and trails. The total number of cattle recovered and restored to owners was 853, and the valuation placed upon the steers was twenty thousand dollars.

The tenth annual meeting of the association was held at Weatherford, in March, 1886. At this meeting, Mr. Carter was persuaded to once more occupy the highest office within the gift of the members. Mr. W. S. Ikard became First Vice-President, and Mr. S. B. Burnett, Second Vice-President. Further pressure was determined upon for the proper inspection of cattle, and it was decided to co-operate with the International Range Association in every possible manner.

The eleventh meeting was held at Fort Worth in March, 1887. The Executive Committee presented a lengthy report, showing the result of the work done during the preceding year. From this it appeared that the following number of cattle stolen or strayed had been recovered and returned to members and owners during the year:

At markets	191
At shipping points	79
On trails	646
Recovered by range detectives	100
Total	1,016

The expenses of the Executive Committee for four years were reported as fifty-four thousand dollars, or twenty thousand dollars less than the value of the cattle cut out and returned to owners.

It was reported with much regret that the crime of cattle stealing of a certain character was on the increase, and that additional steps were necessary to check it. The detective service was strengthened, and it was determined to take additional precautions as to brands, and especially as to preventing duplicates.

The year 1888 was marked by the death of Mr. Carter, the original President. He was succeeded by Mr. A. P. Bush, Jr., of Colorado, Texas, the gentleman who is still presiding over the association. At the twelfth annual meeting at Gainesville, on March 13th of this year, a committee was appointed to combine with the Bureau of Animal Industry in gathering information and facilitating the removal of cattle from alleged infected districts. Resolutions were passed opposing the bill throwing Oklahoma open for settlement, and also the amended Palmer bill to place the control of Southern cattle in the hands of men whose interest it was to keep Texas cattle out of the market, "such a course being calculated to involve the loss of several millions of dollars to the cattle interest of Texas." A delegation was appointed to attend the Convention of the International Range Association at Denver, and a hearty co-operation with that body was promised.

The number of cattle reported as having been recovered by detectives of the association during the year was eight hundred and thirty-three, and it was determined to push this line of work to the utmost.

The practice of the Indian police charging a dollar a head for all stock straying across the Red River and returned to owners was condemned, and arrangements made to get rid of the tax. Resolutions in favor of opening necessary trails and for better made shipping cars were also adopted.

The thirteenth annual meeting of the association was held at Fort Worth, March 12, 1889. The number of cattle recovered during the year were reported as being worth ten thousand dollars. Resolutions were adopted endorsing the project of establishing stock yards at Fort Worth, and also slaughter works. Special attention was paid to the growing practice of horse and cattle thieves in Greer and other border counties, and driving stolen stock into the Indian Territory. A memorial was adopted in favor of uniform rates for shipping live stock to Chicago, St. Louis and Kansas City.

Fort Worth was again the place of meeting in 1890, and the value of cattle saved during the preceding year was reported at thirteen thousand dollars. A considerable increase in the practice of cattle thieving in certain quarters was again reported, and it was resolved that one or two inspectors be appointed by the President to inspect all shipments of live stock going East or North to market, and that the same be authorized to pay railroad agents to wire inspectors so that they could go to shipping points or places of destination to inspect the cattle in all shipments.

In 1891 the association held its fifteenth annual meeting at Dallas, and some necessary amendments in the by-laws were made. The amended by-laws contain much matter of special interest, and it is important that some of the most stringent of them should be recorded here as an index of the class of work done by the association. It is recorded in these official papers that whenever any cattle are cut by an inspector of the association, the shipper shall lose the freight, unless he satisfies the inspector at the time that he has an understanding with the owner; or unless the shipper has reported the animal to the inspector or commission firm selling the same.

Whenever there is any dispute between members of the association as to the ownership of any animal held by an inspector of the association, they may submit such dispute to the Executive Committee at a regular meeting of the same, upon the agreement of those in dispute to abide by the decision of said committee.

No member of the association shall have the right to claim any animal through the association, unless the same bears his brand, and the brand of the party from whom he claims to have purchased said animal shall not be considered his, unless he has written transfer of such brand. The preamble states that the cattle interest of Texas can be better guarded and promoted by a perfect understanding and thorough organization among the parties interested. The Executive Committee is called upon to hold regular meetings on the last Mondays in May, August and November, with called meetings whenever called by its chairman. This committee shall have the entire control of all of the business of the association excepting the time when in session. It shall have the power to appoint inspectors, agents and representatives, and an assistant secretary, if, in their discretion, such an officer be required; shall offer rewards and do any and all things which the association could do if in session, and its action shall be binding on the association. It shall audit all the accounts of the association, at each annual meeting make a report covering all matters requiring the attention of the association, and recommend such measures as it shall deem of importance for the action of the association. Any five members of the committee shall constitute a quorum.

Any person of the age of eighteen years or over, owning or controlling cattle, is eligible for membership, and one of the first duties of a member is to make and file with the Secretary a list of his brands and marks accompanying such brands, as nearly as possible, of all the cattle for which he asks protection; the number of said cattle for which he asks protection; the number of cattle to be not less than the number rendered by him for taxation, and to include all other cattle owned or controlled by him, with the number of his cattle, his post office address, location of ranch, etc., all of which shall be recorded by the Secretary in a book kept for that purpose, and shall be open at all times for the inspection of the members of this association.

Article twenty of the association enacts that, "Any member of this association who shall mark, brand, kill or sell, or in any way appropriate for his own use or benefit, any stock not his own, and without proper authority from the owner, shall be deemed guilty of an offense, and upon conviction, as hereinafter provided, shall be expelled from the association." Article twenty-one states that,

"Any person who shall drive other cattle than his own from their accustomed range, thereby damaging the owner, will be guilty of violating the good intentions of the association, and on conviction, as hereinafter provided, shall be subject to expulsion, suspension or reprehension, as the association or Executive Committee, by majority vote, may see proper to inflict."

It is made the duty of every member to report the violation of by-laws, and careful precautions are taken for the impartial trial of every member against whom charges should have been made. It is made the duty of the Executive Committee to consider said charges, and, if it deem a trial necessary, the said committee shall cause the Secretary to summon the accused to appear, with any witnesses or other evidence he may have, at the next meeting of the association, there to stand trial upon such charges. But if, upon consideration, the Executive Committee shall not deem a trial necessary, the accuser shall have a right to present his charges, together with such evidence as he may wish, before the association, at its next ensuing meeting, for its action upon the same; and, if it be deemed that a prosecution be necessary, the Secretary shall summon the accused for trial at the next ensuing meeting of the association, in the manner hereinbefore stated.

Whenever the Executive Committee shall be reliably informed by any member of the misconduct of any other member, and said information shall have been presented in writing, it shall be the duty of said Executive Committee to cause an investigation into the truth of such charges; and if, in the opinion of the committee, the facts warrant it, the committee shall cause the accused to be brought before the association for trial. The highest, or first degree of punishment, is expulsion; the second, suspension, and the third, reprehension; and a majority vote of the members present will be necessary to inflict punishment to any degree. After a member is expelled, he cannot apply for new membership within twelve months; and it is further enacted, that it is the duty of every member of the association knowing of a case of branding, killing, driving, milking, or in any way using or appropriating any cattle without proper authority from the owner, to report the same to the association, which binds and obligates itself to prosecute all such offenders to the full extent of the law.

These by-laws and rules have been acted upon with the best results, and may be taken as model articles for an association of this character.

Fort Worth was made the headquarters of the association, and an office provided for the Secretary there. The detective presented a most valuable report, showing the recovery of 265 appropriated cattle at Chicago, 274 at Kansas City, 106 at St. Louis, 91 on the Fort Worth & Denver Railroad, 78 in the Indian Territory, and 30 elsewhere. The total value of cattle thus recovered was $14,149. In addition to this, 577 head of cattle had been cut out of trail herds, and the aggregate value of cattle recovered was $21,073. The report was received with much approval, and the detective department was continued.

In March, 1892, the association convened at Fort Worth, Mr. Bush in the chair. In the course of his remarks, the chairman called attention to the fact that there were at that time eight million head of cattle on the Texas prairies, worth, at a low estimate, seventy-two million dollars. In prime condition, these cattle would realize, at the great cattle markets of the country, an enormous sum. He strongly urged the establishment of local packing houses and yards, and also the necessity of harbor and shipping facilities. The detective department made a lengthy report of its work, from which the following results appeared:

Recovered at Chicago	280	head.
Recovered at St. Louis	155	"
Recovered at Kansas City	386	"
In Oklahoma Territory	60	"
At Darlington, I. T.	63	"
At Washita	37	"
At Fort Sill	9	"
At Amarillo	29	"
At Colorado	5	"
On the Cherokee Strip	15	"

The total value of cattle recovered and returned to owners during the year was estimated at thirty thousand dollars, and a very general improvement in conditions reported.

A resolution was introduced and adopted whereby the prevailing system of docking broken-ribbed cattle five dollars per head by the purchaser, after they had been sold on the markets, was entirely done away with, and such cattle are now sold on their merits, being condemned before they are weighed, and sold separately as bruised cattle, etc.

In 1893 the association met again at Fort Worth, where it was heartily welcomed by the Mayor of the city. In his speech in reply, Mr. Bush said that although a few years ago the association had been on its decline, it was now at the zenith of its prosperity, with a record of a million and a quarter of cattle on its books, as well as the names of over four hundred prominent stockmen.

The Executive Committee reported at length, stating that during the preceding twelve months 2,540 head of stolen cattle had been recovered in the interests of members. Of these, 791 had been returned to their owners, and the remainder had been sold for $25,452, the proceeds being remitted to the owners.

The 791 head of cattle not sold would, at the same price the others sold for, be worth $11,509, which, added to the sales of the 1,749 head, would make the sum total of $37,963.50 as the value of the cattle caught by the inspectors for the past year. These cattle were caught by the following inspectors:

T. J. Moughon, at Chicago	193 head.
B. F. Denison, at St. Louis	705 "
Thos. W. Snow, at St. Louis	157 "
G. B. Grissum, on Fort Worth & Denver Railway	107 "
J. R. Kennedy, on Fort Worth & Denver Railway	137 "
W. H. Keen, on Fort Worth & Denver Railway	269 "
W. L. Lyons, on Southern Kansas Railway	165 "
V. W. Allen, on Texas & Pacific Railway	316 "
J. W. Holt, on Texas & Pacific Railway	6 "
Henry Hoover, on trail	35 "
W. G. Crump, in Indian Territory	91 "
B. P. Wade, in Indian Territory	61 "
William Smith, in Indian Territory	152 "
J. J. Stewart, in Indian Territory	47 "
Eugene Logan, in North Texas	59 "
Total	2,540 head.

At the second day's session the name of the association was changed to the Cattle Raisers' Association of Texas, and Fort Worth was finally made the permanent headquarters. The proposition of Mr. G. W. Simpson, of Boston, for the purchase of the Fort Worth Union Stock Yards was considered, and hearty co-operation was promised that gentleman in his proposed enterprise.

Before the meeting adjourned, its excellent work and great success was recognized by the receipt of the following applications for membership from prominent cattle owners.

Applications for membership were received from

	Head of Cattle.
J. W. Weaver, Indian Territory	600
Jules Washington, Indian Territory	2,000
Jones & Robinson, Indian Territory	400
A. J. West, Live Oak	700
Garrett & Collier, Hall County	
R. M. Bourland, Indian Territory	1,000
Live Oak Ranch Company	5,000
Hume Bros., of Austin	5,000
Jackson & Aldwell, of Sherwood, Coke County	2,500
Barnett & Gibbs, of Dallas	

	Head of Cattle.
W. T. Ward, of Knox County	500
L. H. Pruett, of Scurry	500
R. B. Masterson, of Mobeetie, Hemphill County	1,200
John R. Lewis, of Nolan County	1,000
M. T. & E. J. Johnson, of New Mexico, Indian Territory	5,000
John Dennis, of Eastland County	150
J. M. Campbell, Indian Territory	100
H. Windom, of Callahan County	400
G. H. Ray, of Texas	500
T. J. Ciegg, Eastland County	400
Jas. Funk, of Tom Green County	2,500
Wm. Powell, of Rome, Wise County	
H. P. Reed, of Lowell	300
Louis Runge, of Menard County	2,000
W. W. Watts, of Crosby County	3,000
J. V. Stokes, of Midland and Ector Counties	1,000

W. A. Blackburn, of Castro County	800
Cresswell Ranch & Castle Company (Limited), Canadian	20,000
Jas. McLemont, Kinney County	7,000
J. G. Rice, of Sterling County	1,000

The immense area covered by these applications shows how thoroughly the association had outlived its original title.

Last year the eighteenth annual Convention of the association was held, and Fort Worth was again the meeting place, and a most interesting address was made by a gentleman who reviewed the history of the cattle raisers of Texas. "From the Red River to the Rio Grande, from the ocean to the plains," he said, "the live stock interest of Texas has been one of the foremost within the broad commonwealth. It has been reserved though, for the Western stockman, irrespective of State or section, not only to develop the Western plains, but to carry in his bosom the heart of a lion, the intrepidity of a soldier, yet with that enduring patience which has paved the way of civilization through all ages. It has been said that he who makes two blades of grass grow where one has grown before is a benefactor of the human race. Likewise should it be said that he who can produce a bullock that will fatten two pounds on the same feed required to fatten one before, should be called a benefactor of the human race. We say that the wisest statesmen of our time have given close attention to the development of our herds. Noted among these men was the great Clay, of Kentucky, who was one of the first importers of blooded stock from the old world, and for many years Kentucky was considered the home of the shorthorn that is now so prevalent in all the Western country. The time was when the Texas steer was looked upon as a measly, unprofitable animal, commanding no respect in the markets of the world. That day is passing rapidly away. New conditions have obtained. The improvement of your herds has gone on. The increased weight of your cattle shows the diligent attention that they have received. In this great State we find that the people are interested in new methods, having in view the successful feeding and marketing of their stock, and one of the most noteworthy instances with which I am acquainted occurred not more than two weeks ago, when Mr. Burnett, a member of the Executive Committee of this association, having sold to the Ardmore Oil Mill Company, of Ardmore, Indian Territory, some of the cattle that he had raised, they were bought by the king of exporters of the United States, the Eastman

Company, and shipped direct to New York, and they weighed over 1,400 pounds average at the Ardmore pen. And to-day, I am told, Mr. Burnett has brought to this city two car loads of cattle which merit your closest attention and inspection. They weighed over 1,500 pounds average on the scales at Fort Worth Union Stock Yards. These are notable instances, but they are not the only ones.

"Eight or ten years ago it was an almost unheard-of thing that any number of Texas steers should average in weight as much as 1,200 pounds on the market. Fifteen years ago 1,050 to 1100 pounds was about the highest that we could possibly expect from four or five months' feeding of our best cattle. So you see that from 1,050, in fifteen years, we have advanced to 1,500 and 1,600 pounds; that it has become a common occurrence for us to have cattle that will weigh as much as 1,300 to 1,400 pounds. This has not been accomplished by the extra amount of feed given to our stock, but it has been accomplished by the improvement of our herds. About the same amount of feed was given then that is given now. About a year ago, a bunch of the '6666' brand of cattle was sold to Mr. Moore, and fed at Denton, that averaged 1,046 pounds when they went into the feed lots, and weighed in the market at Chicago 1,349 pounds, after being on feed 110 days. These are facts that are worthy of your serious consideration. You must change your old methods of doing business. Instead of running thousands of cattle in the West upon lands that may be affected by the drought, where the grass may be destroyed at times and herds moved about, you have got to commence raising fewer cattle and better cattle, until your herds are reduced to that number where they can be successfully taken care of and well matured for market. I might say that there has been an innovation in the cattle business. This shipment of cattle direct to New York has had an encouraging effect among Texas stockmen. They feel that there is another door open for their cattle. In the shipment of cattle to the East in the past years our prime cattle, coming from the State of Texas, have been known as native cattle. Texas cattle have not received that degree of attention and recognition which they have merited, but gentlemen in the East who are butchering and exporting to European markets are beginning to learn that as good an animal can be produced in Texas as can be produced in any other country on the face of the earth."*

The expenditure of the association for the year was reported as heavy, but results were excellent. The Secretary reported the number of cattle taken or cut out by the inspectors at 3,509 head; of that number there was sold, 2,105 head, aggregating in cash amount, $34,278.94; the balance of the cattle, 1,404 head, at the same value, amounts to $22,857.32, making total value of cattle taken, $57,135.26. Besides this there were still held for investigation seventy-five head, valued at $1,221, making a total number of cattle actually cut by our inspectors, 3,584 head, valued at $58,357.26. These cattle were caught at an expense to the association of $35,488.04, which shows a saving to the members in money of $22,869.22.

Following is a list of inspectors, locations and the numbers of cattle cut by them:

B. F. Denison, Kansas City	720	Henry Hoover, Mangum, Tex.	40
Thos. W. Snow, National Stock Yards, Ill.	381	T. E. Baxter, Ponca, I. T.	35
V. W. Allen, Chicago and Colorado, Tex.	380	J. J. Stewart, Fort Sill, I. T.	25
W. L. Calahan, Midland	325	John Graham, South Omaha, Neb.	16
W. H. Keen, Wichita Falls, Tex.	329	C. E. Martin, Victoria, Tex.	15
W. L. Lyons, Canadian, Tex.	317	Perry Griffin, Tex.	12
G. W. Waddell, Chicago, Ill.	198	J. O. Taylor, Beeville, Tex.	7
J. R. Kennedy, Amarillo, Tex.	142	W. N. Huff, New Orleans, La.	7
S. H. McCabe, Elgin, Kan.	118	W. F. Smith, Ponca, I. T.	5
J. W. Smith, Colorado, Tex.	82	Geo. Montgomery, Union Stock Yards, St. Louis	3
Eugene Logan, on the range	78	D. G. Franks, Del Rio, Tex.	5
W. G. Twyman, Lamar, Colo.	66	P. S. Roberts, Higgins, Tex.	2
Eli Moore, Wichita, Kan.	58	T. J. Moughon, Chicago, Ill.	2
H. C. Babb, Rock Island Railroad	57	J. N. Hewett, San Angelo, Tex.	1
W. G. Crump, Darlington, O. T.	42	Total head	3,509

* The experimental purchase of Texas cattle for the East has not been repeated in the manner anticipated or hoped, the reason given by a gentleman well qualified to know being "that the purchase of cattle in the feed lots of Texas and their movement to the East was not attended with sufficient enthusiasm to justify the adoption of this method of securing supplies for either domestic or foreign consumption."

One thousand four hundred and four head of this number were turned over to owners, or returned to their range. The balance, 2,105 head, were sold for the benefit of owners, and brought an aggregate of $34,278.94.

To give an idea of the immense work done by the association during the preceding ten years, a report was presented of the number and value of cattle secured and returned to members during that period.

Some idea of how the extraordinary results have been attained, may be gleaned from the instructions issued to the inspectors. Each of these is required to make use of the brand book furnished him, and to "closely, honestly and impartially" inspect the marks and brands of cattle, whether being shipped to market or driven or shipped from one range country to another. All such cattle found in the possession of any person not having legal authority to hold or handle the same, must be taken possession of for the owner, as his agent.

When parties refuse to give up cattle, and have no authority to handle them, the inspector must proceed as the law directs, to get possession of the cattle, by sequestrating them in the name of the owner, as his agent. If necessary, in such cases, he is authorized to employ a lawyer to conduct the cases. When an inspector finds persons in possession of cattle under such circumstances and conditions that they are guilty of theft of such cattle, he must at once make a complaint against, or report such parties to the grand jury, always taking the quickest plan of bringing them to justice, and seeing that all necessary witnesses are properly summoned to appear and testify in such cases. After indictments are found, the General Manager of the association will take charge of the cases and have them prosecuted.

An inspector must not allow anyone not a member of the association to examine his brand book, or look at any mark or brand in the same, keeping it secure from cattle thieves, who often try to steal them. He must not tell anyone not a member of the association who the owner is of any particular mark or brand. In many instances thieves locate stray cattle, and if they can find out that the brands of such stray cattle are not on the association books, they have no fears about stealing them, and as the object, or at least one of the objects, of the association is to prevent stealing, the inspectors are warned not to furnish such thieves with the information as to whether they can steal these located strays with impunity or not.

The inspectors may not handle any cattle outside of those belonging to members under the penalty of being discharged for the first offense. When parties are guilty of stealing members' cattle or horses within the scope of his work, or under his knowledge or observation, the inspector is required to diligently look into and work up the matter, and do all and everything in his power honorably to bring such parties to justice for such violation of the law. All stock taken must be cared for to the best advantage. Inspectors at shipping points and on the range secure pasture for all cattle recovered by them at best possible rates, to be paid by the association; and in his report of such cattle, states what pasture he put them in and what the cost is per month per head. The Secretary reports to the owner where his cattle are, what pasture they are in, etc., and if within reach of the owner, and he so desires, he can send and get the cattle.

If the owner does not take his cattle from the pasture within a reasonable time, and they are fat and ready to market, the inspector may ship them to market by and with the consent of the manager, shipping to such commission house as the manager may direct. The proceeds of all cattle shipped in this way, with account of sales, must be sent to the Secretary, and a duplicate account of sales may be sent to the inspector shipping the cattle.

When an inspector at a shipping point ships any cattle to market he must make a tally of them, describing the marks and all the brands of each animal, and who he claims same for, and any other information that the inspector may think necessary, and forward the same to the inspector at the market to which he is sending the cattle, so that it may reach the inspector in the market before the cattle arrives. Also, when an inspector at shipping points wishes to have any cattle in a shipment passed by the inspector at the market, he must do as above directed in shipping cattle; also report to the Secretary all cattle so passed and why they were passed. Inspectors at the markets are governed by these instructions as to legal authority for handling cattle; also as to the manner of procedure where

shippers refuse to give up our cattle; also as to reporting to the Secretary all cattle the proceeds which they have caused to be held up.

Under the late regulation of the association, inspectors are required to collect the gross proceeds of cattle caught by them under certain circumstances, which are as follows: Parties who ship members' cattle without authority, and the circumstances surrounding the shipments indicate that they did so with a view of getting the proceeds for their own use and benefit, and to deprive the owner of the same, then in such cases they are required to collect the gross proceeds of all such cattle, except what is allowed the commission men for selling, but nothing more.

They must also weigh all cattle caught separately, so that they can get just what the cattle bring in the market. It is sometimes the case that shippers will ship one or more steers that don't belong to them with a lot of their small cattle, and, when found by the inspectors, give him an average of the lot. "We don't want any more of that kind of business," says the President, "so don't fail to weigh separately the cattle caught."

Inspectors must be men of good moral character, industrious, and capable of filling the position; must be practical cowmen, good and quick on marks and brands, and must be strictly temperate and sober. No habitual drinkers need apply for a position on the force. If any inspector drinks to excess while working for this association, it will subject him to being discharged from the service.

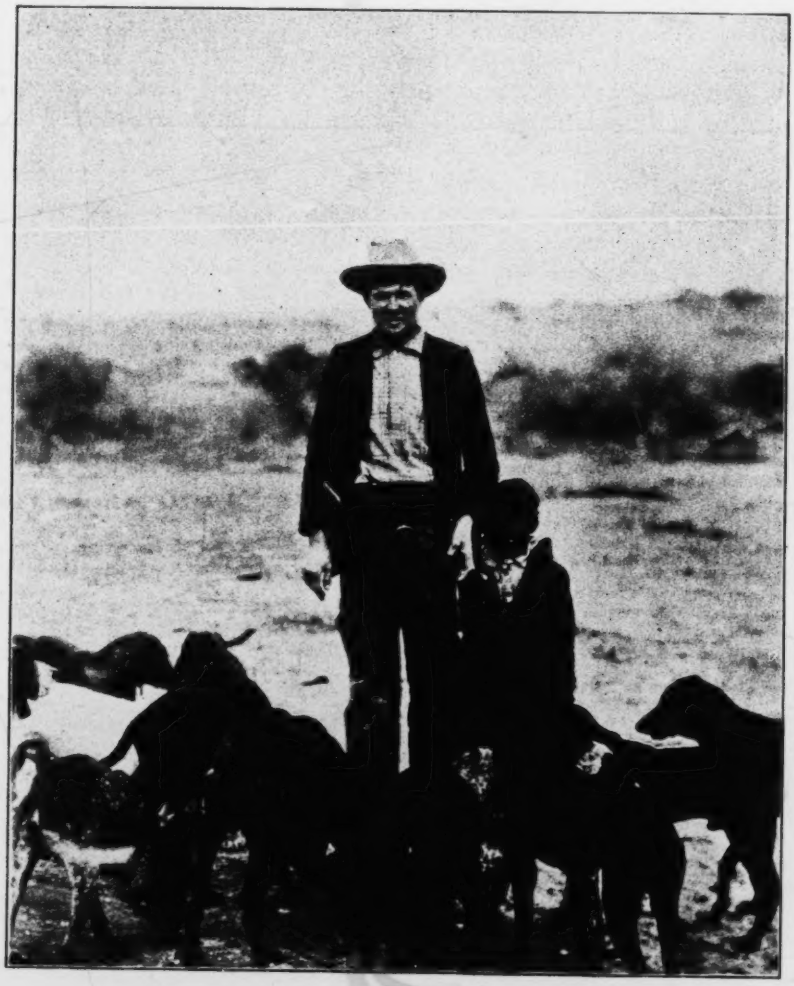
Inspectors are requested to give their entire time and attention to the work required of them, and at all times and under all circumstances to work and exert their best energies for the promotion and general good of the association and its individual members.

The increased resources of the association enabled it to maintain during the whole of the year 1893 permanent agents at Chicago, St. Louis, Omaha, Kansas City, New Orleans and Wichita, as well as to keep agents at all shipping points in Texas and the Indian Territory. These agents discovered that cattle were being driven from Texas and the Neutral Strip into Southern Kansas, and being shipped to the Northwest. One large shipment of cattle had been traced to Denver, the thieves having been convicted and the cattle returned to the owners. At the time local or railroad inspectors were placed in Southern Texas there was every indication that an extensive and well-organized system of cattle stealing was about to be inaugurated in that territory. As a proof of this, in one instance two or more car loads of stolen cattle were found abandoned close to a shipping point, where, the day before, an inspector had been placed. Upon investigation, some two or three hundred head of stolen cattle were caught. "This seems," says the report, "to have paralyzed all thieving in that part of the State for the time being, though we well know from past experience that it is only by constant watchfulness that we can keep this lawless element under control. Therefore, it should continue to be the policy of the association to catch and prosecute thieves, regardless of cost."

The dressed-beef question was discussed at great length. "The class of cattle, as a whole, produced in Texas and the Indian Territory, is more desirable for all markets than that of any other locality. The Eastern slaughterers are becoming familiar with the Texas bullock, and intend to adopt the same tactics as the packers in other great centers, which is to make their purchases nearer the source of supply, which not only affords them a better selection, but gives them an opportunity of making and saving by shipping direct. Texas produces one-seventh of all the cattle raised in this land, and this alone is sufficient reason for the establishment of a home market, and with the experience of the past, it is reasonable to suppose that the market nearest the source of supply would continue to develop and increase.

"There are now seven live stock markets in the West, including Chicago, Kansas City, St. Louis, Omaha, Sioux City, St. Joseph, and last, but not least, Fort Worth, which offers greater advantages to the Texas stock-grower than any other of the great markets. The Chicago packers have been of great advantage in distributing the Texas product, and through their influence have created a demand all over this broad land. They have been paid for all the service rendered, and the time has now come, in the progress of events, when the grower, who is the party most interested, should adopt such methods as will give him the greater return for his investment, and as all the waste, shrinkage, additional freight and yardage charges must be borne by the producer, it behooves him to figure as closely as possible to the minimum.

"The exporting of live cattle now seems to be a prominent industry, and with the proper steamship facilities, there seems to be no reason why the Texas animal should not be shipped direct to Liverpool from New Orleans and Galveston, and if the cattle feeders will arrange to have fat cattle ready for market at all seasons of the year, and feed them in such a manner that they will not be obliged to dispose of them within a limited time, the home market will be assured, and buyers from all parts of the country will be seeking their supplies from the Fort Worth stock yards. The attention of slaughterers throughout the country is turned toward this great center, and besides this, the railroad and steamship managers are now soliciting through business, which they never before enjoyed, and are willing to make concessions in order to secure it. Resolutions on this important subject were adopted."



A RANCH "PACK."

On the third day of the Convention, Col. Black called attention to a matter which the writer of these historical chapters has felt very often while preparing them. This is the need of a National Bureau of Statistics, and his remarks were heartily endorsed.

The 1895 Convention was held in March, at Fort Worth, and the attendance was very large. Mayor Paddock turned over the keys of the city to President Bush, and Mr. George Loving made a characteristic address, in the course of which he said:

"It would be difficult in any State, in any country, in any clime, to collect together a body of men whose personnel would compare even favorably with the Convention here assembled to-day, while for intelligence, cultivation, integrity, high manhood and loyal citizenship, it is doubtful if a superior body of men could be chosen and congregated from any class or industry in the land. I mean no fulsome praise in thus speaking, but plain, simple truths, known of all men who have mingled with the cattlemen of Texas as I have, and known them as I know them. It is not singular, therefore, that Fort Worth should open wide her gates, and bid you welcome to her hospitality, or that the local live stock men should feel a pardonable pride in having their brethren as guests on this occasion.

"In this association is closely linked the past, the present and the future of the cattle interest in Texas. I see before me many of the pioneers and early settlers, who, more than a third of a century ago, moved beyond the lines of civilization, and with daring intrepidity planted their banners far out in the wilderness. I see descendants of others who fell in the struggle with the savage, and I see the new comers from all States and Territories, and the new beginners from all parts of our magnificent State,

all united in the common brotherhood, engaged in a common industry, loyal to the common good, and pledged to stand by each other's interests, promote each other's welfare, and guard each other's rights. It is a grand association, potential for good to all classes and all interests, and splendidly equipped and supremely endowed for the mission of making Texas the leading live stock State on the earth.

"It has been my privilege from youth up (having been cradled on a frontier ranch), to be associated with the cattlemen, and a close observer of the live stock interests of Texas, and am therefore in position to know whereof I speak, when I say this association may justly be congratulated as embracing the best, the bravest, the most solid and the most progressive men engaged in the industry.

"It was a wise step you took two years ago, in so changing your constitution as to encompass in your organization the cattle raisers of the entire State, and you are to be congratulated on the results, as indicated by the large attendance at this meeting, and the character of the men who have come up from all parts of the State and the adjoining Territories to take part in your deliberations.

"You have many reasons for being satisfied with the achievements of your organization. You have brought system and safety out of chaos and confusion. You have improved the breeds of your herds, you have educated all classes concerned in stock raising, and mavericking is no longer a profitable vocation in Texas. You have recovered many thousands of dollars worth of stolen stock and in many instances punished the thieves, and your detective system is now so complete and so extensive, that it is nearly impossible for a depredator to get away with his plunder or escape punishment. You have been instrumental in securing valuable legislation for the protection of the live stock interests, and you have paid into the treasury of the State several hundred thousand dollars for the privilege of grazing your herds on the wasting grasses of the unpatented prairies. You have planted wealth, culture, the church and the school house throughout a vast empire of territory that but a little while ago was the home of the buffalo and dominated by the savage. You have placed the cattle industry of Texas in the foremost front and made it worth the while of the largest dealers on the continent to make your acquaintance, and the largest capitalists engaged in the business to establish packing houses at your door.

"By your conservatism, forbearance, manly magnanimity and high appreciation of justice, you have preserved kindly relations with the man with the hoe, and you are at this very hour the prime factor in harmonizing the three great controlling industries of the State, agriculture, live stock and railroads, and bringing them to a proper understanding of their mutual dependence and to foresee a period of prosperity unparalleled in the history of the nation in the unity of the policies, interests and rights of all, recognized in legislation, respected by the people and enforced by the courts. What promotes the interests of agriculture advances the prosperity of the railroads, and what benefits these two great industries can but conserve the stock-raising interest, and vice versa, the policy and the legislation that enhance the stock raisers' profits must redound to the benefit of other kindred industries.

"It is probable that the auspices under which you meet this year are brighter and more encouraging than at any previous meeting within your history. You have had a long period of losses, discouragement and despondency, but the night is passed and the bright sun of the morning bids the cattle industry of Texas be of good cheer and go forward with renewed energy, strengthened confidence and courageous venture. The heavy losses sustained during the protracted drouth of the past few years may not have been unmixed evil. Good sometimes comes of the direst disasters; and the traditional 'silver lining' may in this case, to the cattlemen of Texas, become veritable gold. The pastures were overstocked, grass was exhausted, cattle were not improving as rapidly as could be wished, and prices had fallen too low for profit. The mortality and the annual transfer of more than half a million head for several years to the grazing fields beyond the limits of the State, was to a great extent a providential cutting down of the herds, thus leaving room and sufficient grazing for those that were left and affording opportunity and incentive to improve the breeds.

"The grazing grounds of Texas were thus given a rest to some extent, while you have very wisely taken advantage of the opportunity to improve your herds; consequently they have brought a better price in the markets, and many shipments of Texas steers, under the improved methods of feeding and breeding, have been rated as 'tops' and command prices equal to the best Western product. You have

but to keep up this system of improvement and intelligent management to place Texas, at no distant day, first in the quality of her beef, as she is first in numbers. This, Mr. President, is not the only reason why I say that the cattle situation in Texas is most favorable, and that those who contemplate embarking in the business, or who wish to increase their herds, are not likely to find lower prices for investment for many years to come. Texas cattle are going to be in great demand in the future, and new markets are soon to be opened to her enterprising citizens. She is the gateway to the West India Isles, Mexico, Central and South American States, and the Asiatics through the Panama canal; and deep water at her ports being now assured, the commerce of the interior is already preparing to find shipment over Texas roads through Texas ports to foreign markets. Let no man doubt that at an early day we shall have deep water navigation at one or more Texas ports, and that capital, enterprise and shipping will come to control the heavy freights and all rapid transit commerce for all that vast region of country lying between the Mississippi and the Rocky Mountains. In this new era of prosperity, the cattle industry of Texas will be more interested and will reap greater profits than industries further from the point of water shipment, and she will take her position as the leading cattle-producing and meat-packing State of the continent. The trains of commerce that we now see rolling northward from our very coast, carrying the products of our soil and our ranches a thousand miles to market, and another thousand miles to deep water for shipment, will continue to roll with increased speed and enlarged tonnage, but in the opposite direction, bearing the grain of the West to deep bottoms in our gulf ports, and our fat steers of the Territory, Kansas, Nebraska, Iowa, Colorado, Wyoming and New Mexico to the stock yards and packing houses of the Southwest for shipment through Texas deep-water ports.

"It were well, therefore, that the Cattle Raisers' Association of Texas should prepare to accommodate the new order of things, and it were wise to take early action looking to increased packing facilities; for, though we have here at Fort Worth a magnificent plant with large capacity and ample capital, the time is near at hand when not only the entire Texas product, but the product of a wide extent of grazing country beyond her Northern and Western lines will seek packing facilities on the cheapest lines of transportation and in proximity to the waterways that float the largest bottoms. Our stock yards and packing houses will have to be multiplied enormously to meet the emergency. Let it once be understood that the cattle raisers of Texas have made up their minds to patronize the home packeries to the fullest extent of their capacity, and we shall have the Armours and other mammoth packing millionaires in our midst, seeking for plants, and the great capitalists who handle the product will also be here and afford you a market at your own door that will enable you to at least retain a fair proportion of the profits of the industry.

"When these changes come and the cattlemen of Texas begin to realize the magnificence of their princely estate, and the grand possibilities of organized power and intelligent management, your association will number many thousands in its membership, and aggregate a volume of wealth, intelligence and physical forces that will give you control of the business of the Southwest, if not of that entire empire west of the Mississippi River, and enable you to select your own markets, domestic and foreign, and name your own prices."

The report of the Executive Committee showed a healthy financial condition. It also showed that 2,221 head of cattle had been taken up or otherwise recovered, sold, and the proceeds handed to their owners. Also, that 1,792 head had been returned to owners, with an additional 146 held pending investigation, making a total for the year of 4,159.

The 2,221 head of cattle sold realized the sum of $36,394.57, being an average per head of $17.28. The remaining 1,938 cut, at the same price per head, would realize $33,488.64, making a total value of cattle caught by the association of $71,883.21, against a total value of cattle caught for the year previous of $58,357.26, showing an actual increase of saving to members of this association, of $13,525.95. This work was accomplished at an expense of $37,074.13, against an expense for the year previous of $35,488.04, or an increase in expense of only $1,586.09. In other words, the increased savings of $13,525.95 has cost the association only $1,586.09. Again, we find that the total cattle caught this past year, amounting in value to $71,883.21, only cost an expense of $37,074.13, thus showing an actual saving, in dollars and cents, of $34,809.08.

Following is the list of inspectors, with the number of cattle cut by them:

T. J. Poston, Chicago	397	Price Dockery, Lamar, Colo.	11
V. W. Allen, Colorado	246	J. N. Hewitt, San Angelo	4
G. W. Waddell, Chicago	6	George Montgomery, St. Louis	17
B. F. Denison, Kansas City	722	W. S. Moore, National Stock Yards	188
J. J. Stewart, Fort Sill, Okla.	33	W. N. Huff, New Orleans	3
T. W. Snow, National Stock Yards	17	Perry Griffen, Oklahoma, Okla.	4
W. L. Calahan, Midland	670	J. M. Barkley, Chickasha, I. T.	215
S. V. Edwards, Cotulla	49	M. H. Beetham, South Omaha, Neb.	7
D. G. Franks, Eagle Pass	24	J. C. Loving, Secretary	3
J. O. Taylor, Beeville	8	Eugene Logan, Clayton, N. M.	240
C. E. Martin, Victoria	26	W. G. Crump, Calumet, Okla.	39
W. L. Lyons, Canadian	380	L. M. Barkley, Wichita Falls	90
W. F. Sims, Cotulla	1	Eli Moore, Wichita, Kan.	8
John Graham, Woodward, Okla.	119	J. B. Franklin, Beeville	6
H. E. Siders, Amarillo	292	A. L. Chesher, Seymour	37
W. H. Keen, Wichita Falls	129	B. W. Stewart, Clayton, N. M.	42
J. W. Holt, Eddy, N. M.	143	F. A. Gallagher, National Stock Yards	29

In this connection the attention of the association was again called to the work that has been accomplished by the association since the establishment of the protective and detective system, and there was added the table giving the number of cattle caught during the past twelve years, their value per head, and their total value:

DATE.	Cattle rendered.	Market.	Trail and shipment.	Total Cattle cut.	Value per Head.	Total Value.
1883-84	730,000	. .	500	500	$35 00	$18,500
1884-85	766,000	344	500	853	25 00	21,325
1885-86	744,000	325	819	1,144	20 00	22,880
1886-87	520,000	191	625	1,016	16 00	16,266
1887-88	469,000	275	556	333	14 53	12,026
1888-89	500,000	. .	. .	691	15 00	10,365
1889-90	600,000	490	333	823	15 30	12,600
1890-91	650,000	844	577	1,421	14 83	21,073
1891-92	750,000	941	906	1,847	16 20	21,941
1892-93	1,100,000	1,749	791	2,540	14 94	37,963
1893-94	1,381,873	2,180	1,404	3,584	16 28	58,357
1894-95	1,385,303	2,221	1,938	4,159	17 28	71,883
Total number caught			19,411	Total value		$319,249

"In the face of bad times in the cattle business," the report went on to say, "the association has to congratulate itself on an increased membership again this year. The total membership now stands at six hundred and ninety-five, or an increase of over one hundred members during the year; and it is a noteworthy fact, evidencing the good work that has been done, and the confidence stockmen have in the efficiency of the association, that while some names have been taken from our lists, with the exception of perhaps half a dozen, this has only occurred where the old members had retired from business. As an evidence of the interest taken in the association by its members, we would specially call attention to the fact that out of a total assessment and dues for the past year, amounting to $35,340.88, our books show only a delinquency of $797.08, and of this amount we are confident the greater part will be collected during this meeting. We do not believe that any other association of the magnitude of this one, composed of any class of people, can make a better showing than this.

"With the slightly increased funds in the hands of the association, it has been enabled during the past year to reach further out into territories where hitherto, for the want of sufficient funds, we were not able to reach; the result being, as can easily be seen from the foregoing, that a greater number of cattle have been caught than in any other previous year during the existence of the association, and we

are satisfied that if all members would make a proper rendition of cattle owned by them, thereby increasing our revenue, that the association could still extend the good work it has been doing.

"The principal field of operation by the thieves, we find to be along the border lines of the State and in the Indian Territory and Kansas. On the ranges in Texas, New Mexico and the Territory, we have been compelled, during the past year, to send out regular outfits to round-up and cut burnt and stolen cattle. In one work alone in the Territory, extending to about fifteen days, we cut about one hundred and seventy-five head of burnt cattle, every one of which, except one head, was identified by the owner. We further find that since the feeding industry has developed in Texas and the Territory, that we are compelled to inspect the feed lots. Only quite recently we found in one pen, in Sherman, Grayson County, sixteen head of cattle belonging to members of the association, sold to feeders without the authority of the owners. We recite these facts to impress upon the members the magnitude of the work that this association feels called upon to do, and to bring to their minds more forcibly the necessity of increased revenue.

"Our prosecutions have been as vigorous as it was possible to make them, and, as an evidence of the fact, we have sent during the year twelve thieves to the pen, a greater number than in any previous year, and now have pending in various parts of this State, and in Kansas and Indian Territory, thirty-four cases. These prosecutions and convictions have been had at an expense of $1,287.02, less than our expense for attorneys' fees and litigation in the previous year.

"We would like to impress upon our members the importance of reporting to the Secretary all sales of cattle, when sold, to be held on the range or in feed lots anywhere, giving number and class sold, to whom sold, on what range they will be kept, and what brands the purchaser places on them. This information, made promptly at the time of sale, will save much trouble and confusion between our inspectors and the owners, and the original owners of the cattle.

"Your committee has pleasure in reporting that after the consultation it had last year with a committee of the commission merchants, regarding the handling of cattle cut in the markets, there has been some improvement, at least by some commission firms, in more speedy settlements of our claims. Your committee feel, however, that a still greater improvement could be made in this direction, and it would recommend that a committee be again appointed at your meeting to confer with the commission merchants, now attending this meeting, and see what further improvement can be attained.

"We recommend that Article 12 of our by-laws be amended by adding the following:

"'Article 12a.—It shall be the duty of the Secretary to collect from the owner all pasturage paid by this association, or for which it has become liable, upon cattle belonging to members of this association, and caught by inspectors of this association, and held by such inspectors on pasturage.'

"That Article 14 be amended by adding thereto Article 14a, as follows:

"'Article 14a.—No member of this association shall render any brand to this association unless he owns or controls all the cattle in said brand.'

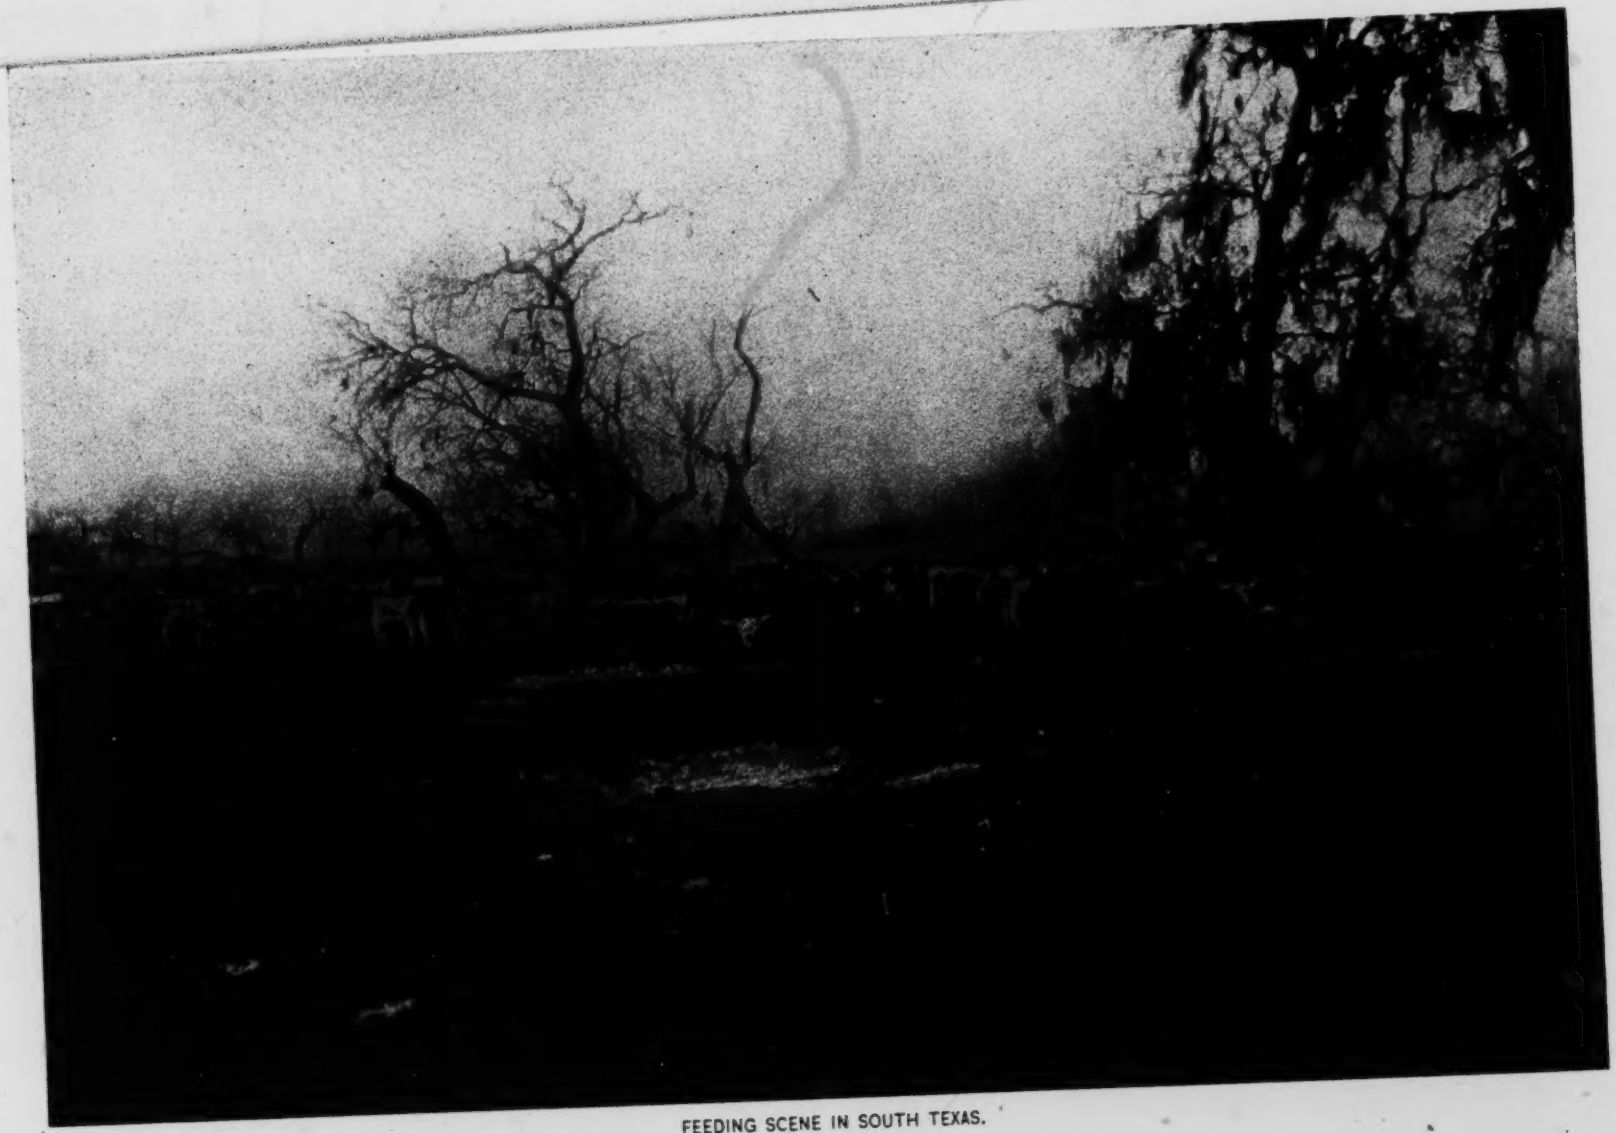
"That Article 18 be amended by adding thereto Article 18a, as follows:

"'Article 18a.—When a member of this association wishes to discontinue his membership in the same, he must notify the Secretary of such intention, and pay his indebtedness to the association up to the date of his withdrawal; on payment of such indebtedness, the Secretary shall furnish the member so withdrawing with an honorable discharge from the membership of said association, provided there are no charges against such member for violations of the by-laws, rules and regulations of the association.'

"We recommend that the resolutions now appearing as an appendix to our by-laws Nos. A, B and C, be made a part of our by-laws, and appear in our by-laws as Nos. 28, 29 and 30, and that the article now appearing as No. 28 appear in future as Article No. 31.

"We recommend that Article 21 of the by-laws, rules and regulations be amended by adding thereto Article 21a, as follows:

"'Article 21a.—Any member of this association under indictment, or other legal accusations of theft, may be suspended from the association at the discretion of the Executive Committee, during the pendency of such accusation, and in the event of the conviction of any member of the association of the crime of theft, the Executive Committee may, at its discretion, expel such member from the associ-



FEEDING SCENE IN SOUTH TEXAS.

THE
JOHN CRE
LIBRARY

ation, provided that all such cases of suspension or expulsion by the committee shall be subject to review, on appeal to the association, at its first annual meeting thereafter.' "

The report was received and adopted, and the various recommendations agreed to.

Mr. Sanson, of Alvarado, read an important paper on cattle feeding, saying that the "history of Texas feeding up to the present is of little interest except as an object lesson, guiding us in our future course and enabling us to engage in the business with the intelligence that leads to profitable results. That cattle feeding in Texas has, in many instances, been carried on in a manner almost reckless, will probably be conceded by all who have had occasion to investigate the subject. It seems to be a well-established fact that the feeder of Texas cattle will stay in the business, regardless of the cost of cattle or feed, as compared with the often low prices in the markets on which he must depend to dispose of his cattle. The feeder, as is often the case, often paying more for his cattle than they would bring on the Eastern markets at the time of purchase, must work with intelligence and skill if he looks forward to even a low rate of profit.

Tree in Graham, Tex., under which Kit Carter, J. C. Loving, C. C. Slaughter and others first discussed the organization of the Texas Cattle Raisers' Association.

"Hereafter, the raisers of cattle must largely depend on the feeders of Texas for a market, or do their own feeding, for there are few localities in the State in which the grass will finish the cattle ready for market at anything like remunerative prices. Viewing the cattle feeding of the future from this point, it will be found necessary to inquire into every detail, both as to the quality of the cattle and the kinds of feed that will secure the best results. This brings us to what I regard as the most important factor in developing the greatest and the grandest feeding country on the American continent. It is impossible for a feeder, however skillful, to make a good quality of beef without the proper material to begin with. Hence the future of cattle feeding in Texas depends more on the raiser than on the feeder. If the Texas feeder is furnished with good, well-bred cattle, he will pay remunerative prices for them, and on his part will make a quality of beef that will compare favorably with any produced in the United States. We produce in abundance every kind of feed that can be grown in other States; and have the further advantage of making one-third of all the cotton seed grown in the Union, a feed not produced at all by any other cattle-raising State.

"I hope to be excused if I seem to lay too much stress on the quality of cattle necessary to make cattle feeding a success in this State. Let the raiser of cattle furnish well-bred steers of good style and quality, and Texas can be depended on to furnish the best kinds of feed, and in abundance sufficient to feed every steer raised in the State. Then it will be left with the feeder to adopt the best methods of feeding and maturing beef of the very best class and quality. I feel confident that every feeder will then be forced to do his best or go out of the business.

"I have heard the statement made by experienced feeders that in no instance has a strictly cold-blooded Spanish steer ever made a feeder one dollar of profit, and my own experience in handling blooded cattle will not incline me to take issue with the above assertion.

"As evidence that the feeder will pay a good price for good cattle, I cite you to several feeders in Texas who have paid as high as thirty to thirty-five dollars for their cattle this season, while many common cattle have gone into feed lots at from fifteen to seventeen dollars. Much more might be said of the necessity for well-bred cattle to make future feeding in Texas the success it should be. I do not wish to be understood as saying that Texas produces no good feeders. There are many such raised here, and the sales of Texas cattle, properly fed, when compared with natives, show their standing and merit in the Eastern markets.

"Much may be said on the subject of feeding—the best kinds of feed, the manner in which given, the quantities and proportions to produce the best results most economically. It would take a long article to go into all these details. Besides I am to say something on the subject of cotton seed and cotton-seed meal and hulls, as to the relative merit of cotton-seed meal and hulls. The most reliable figures obtainable place the number of cattle fed on meal and hulls the present season at about two hundred thousand, and on cotton seed, thirty-five thousand. This fact of itself would seem to settle the question in favor of meal and hulls.

"Yet we must admit that seed when properly fed on grass will make as good beef as any other we have used in Texas. That the feeders of Texas in the past have made more money out of seed than any other feed I do not question. Yet the future use of raw cotton seed in Texas I do not think of importance enough to discuss at length. For many reasons it is going out of use. Chief among these reasons is the fact that seed can only be fed successfully on good pasture, and good pasture land in the cotton-raising districts of Texas is now too high priced to admit of its use as pasture alone. Another, and perhaps the main, reason for abandoning the use of raw seed was the sharp competition between mill men for the last two years, putting seed practically out of the reach of feeders. Yet, should the present low prices of seed continue, it will, doubtless, cause many feeders to return to the use of raw cotton seed; especially will this be so where pasture lands are cheap and in reach of the seed. There are many feeders who will never abandon seed for any other feed so long as they can get them laid down in the pasture at six to seven dollars per ton, and, judging from past experience, such feeders' chances for staying in business are quite as good, or perhaps better, than those of his neighbor, who uses any other kind of feed.

"As to meal and hulls, in order that you may realize to what immense proportions the industry has grown in so short a time, I give a short history of the enterprise. In 1834 the first mill was built at Natchez and was a failure. In 1847 Frederick Good, of New Orleans, made another venture at a heavy loss. In 1857 Mr. Paul Aldridge, of New Orleans, went to Marseilles and watched the manufacturing of the Egyptian seed and the machinery used, came back to New Orleans and established a mill, but found it difficult to induce the farmers to load up their seed and take them to his mill and the various shipping points, they thinking only of the cotton and considering the seed of too small a business to bother with. So with eighteen months' hard labor, with men traveling over the country horseback, he secured only 1,764 tons. Later the mills found the hulls accumulating, and it was with considerable expense that they were carried off and dumped into low places, that being the easiest way to dispose of them. During the war feedstuff became scarce in Mississippi, and the farmers were compelled to allow their cattle to graze off the hulls that had been thus disposed of, and to their surprise the cattle thrived.

"In 1866 there were only seven mills in the United States; in 1872 there were 26; in 1880 there were 45, and now we have 205, of which Texas has 84. The crush of the United States is about 1,500,000 tons, Texas crushing about 700,000 tons, this making an average of 500,000 tons of meal and cakes annually in the United States, and 250,000 tons for Texas alone. Previous to the '80s, our meal and cake were sent principally to Europe. About 1881-2 New England began to take our meal as a feed-stuff for cattle, and by 1887 it was being largely used there, and its value was becoming generally known throughout New England. About 1880–5, the dairy people of Memphis and a few cattle feeders were using meal and hulls extensively.

"The feeding of meal and hulls began in earnest in Texas about 1890, and now we make in Texas alone enough hulls to feed 185,000 to 200,000 head of cattle, and meal enough to feed 600,000 cattle. Thus it will be seen that by supplementing the hulls with sorghum, straw and ensilage—to say nothing of feeding the meal on grass, which is now done successfully—it is possible for Texas alone to feed 600,000 cattle on the products of cotton seed. All this comes under the head of the possibilities of the future feeding of cattle in Texas."

Col. C. C. Slaughter, of Dallas, proprietor of the "Long-S" ranches in Texas and Montana, and who owns in the neighborhood of fifty thousand head of cattle, had this to say: "Meal is said to be the finest feed in the world, because it gets cattle ready for market in from eighty to ninety days. I have tried it only once, and that was last year, at Greenville. Stock fed on from five to seven pounds of meal and from thirty-five to forty pounds of hull per day, will fatten faster than cattle on any other feed in the world. I do not think there is any doubt about that. The reason is that there is so much more oil in the meal than there is in the grass. No matter what process is used, all of the oil in the seed is never extracted. You can take a handful of hulls after they come from the mill and grease your hands with them. When it comes to condition of meat, meal-fed cattle are as tender as any beef you ever tasted. And my experience is that they are just as healthy. I had some cattle fed on meal and hulls to go blind and get sick after having been fed too long, but the disease was due more to an excess of fat than to any other cause. I do not believe it was caused by anything in the meal. A man has the gout from eating and drinking fine things, but that does not prove that what he ate was poisonous; on the contrary, it may be very wholesome. Feeding on meal does away with the necessity for winter grass. A raiser can get meal just as soon as the mills open for business in the fall, and by the new year he has his cattle ready for market. One objection to the feeding on meal and hulls exclusively is that all of the cattle fatten about the same time, and get to market about the same time. It seems to me if we could feed them lightly on meal during the winter and turn them out on the grass in the spring, it might be well. I do not know how that plan would work, because I have never tried it, but I have had a notion of experimenting with it. I believe that after they got fat on the meal and hulls, they could keep their fat on the grass, and then the market would not be periodically glutted and relaxed. There may be found many ways in which meal and hulls may be merged into a combination feed to the great benefit of the business. All that will come later on, because the use of meal and hulls and cake in any shape is largely a novel one, and we will have to have more experience before we discover all of its uses."

Mr. Winfield Scott, of Fort Worth, is feeding twenty-one hundred steers this year. Asked for his experience, he said: "I have been feeding cattle on meal and hulls for three years, and there are no better cattle on the face of the earth. I have tried it in the pens and in the pasture, and I believe the best way to feed is for a man to put his meal and hull troughs right in his pasture, so that cattle can get some grass once in awhile if they want it. From five to seven pounds of meal a day will get a steer in fine shape in from ninety to one hundred days; whereas, if he is left on the range all winter to hustle for grass, he will not be ready for market before July or August. If there is any difference in the quality of meat it is in favor of the meal steer, because there cannot be any better meat than that. It is as tender and juicy as a bird, and always as salable as grass-fed stock. The feeding business is growing wonderfully in Texas. Oil mills are going up all over the State, and the supply of meal and hulls has quadrupled in the last four or five years, and still the demand keeps on, outgrowing the capacity of the mills. I have no way of telling how many cattle are fed on meal in Texas, but it must be close to two hundred and fifty thousand, if not more than that."

Mr. W. T. Waggoner, of Decatur, whose father, Mr. Dan Waggoner, is one of the pioneers, as well as one of the most successful cattle raisers in Texas, said: "We put two thousand on meal last year, and they were the finest lot of steers my eye ever rested on. We fed them ninety to one hundred days, and then sold them. When they got to market every one of them averaged over thirteen hundred pounds, and we got $4.25 and $4.50 for them, too. We fed them on meal and hulls. The meal was for a fattener and the hulls for a distender. It would have taken us at least one hundred and twenty days to have got those cattle ready for market on grass. I don't exactly remember the proportion, but I think it was one pound of meal to seven of hulls. They had a big jollification at Decatur, and father

gave the boys a meal-fed steer to barbecue. Farmers for ten miles around came to the house to know what we had been feeding that steer on. They said they had never tasted such beef before in their lives. We killed one at home and the beef was so tender it just melted in our mouths. I always thought it was mighty hard to beat chicken, but when I tasted that meat I was convinced. Meal-fed cattle are even better in my opinion than slop-fed cattle, and they have always stood at the top of the list. I have tried it, and I know that meal-fed steers furnish just as good and as healthy meat as any class of cattle that ever walked on four feet."

Mr. Burk Burnett said he was not feeding any cattle himself, but twenty-six hundred in which he was interested are being fed at the Ardmore mill by Mr. W. R. Moore. Mr. Burnett added, however: "So far as I have learned results are very satisfactory. Cattle fatten rapidly and that is what we want. We can get meal-fed steers to market in from ninety to one hundred days, while it takes more than one hundred and twenty days to get grass-fed stock in shape. I cannot speak as to the details of the feeding, because it is being done by others. I can tell you, though, that there is a world of cattle in Texas being fed on meal and the number is always increasing."

Hon. T. T. D. Andrews, of Fort Worth, said he was feeding some meal, but he preferred not to be interviewed about it at this time.

Mr. J. W. Hawkins, of Midlothian, said: "I am feeding over two thousand this year. I have found a combination of meal and grass to be better than any other feed. It may take just a trifle longer to get the steers in condition, but they are mighty good when they get to market. Grass is an uncertain quantity, dependent largely upon weather conditions. Besides, it costs something in Central Texas to rent or lease a large pasture. You can always depend on meal and hulls. As soon as the mills open in the fall the supply commences, and from that time till the end of the cotton season in the spring we have a steady supply. It is doubtful if cattle fed on grass can be disposed of at remunerative prices, while those fed on meal and hulls always can be sold to advantage. Feeders lost money last year from a number of causes, but I believe every one of them is coming out all right this season. There can be no question that meal and hulls will fatten a steer quicker than any other food you can give him. As far as the meat is concerned, it is just as good as a man ever put in his mouth. They sell just as readily as grass-fed cattle, and that is the highest and best test. So far as the future of meal feeding is concerned, I believe it has come to stay, and you will see it coming into general use more and more every year."

Robert J. Kleberg offered several resolutions that had been submitted to and approved by the Executive Committee first.

"*Resolved*, That the Cattlemen's Association thoroughly, heartily and unevasively, without any reservation, commend and support the present rigid method of cattle and meat inspection, which we believe is thoroughly enforced by the agents of the Bureau of Animal Industry of the United States Department of Agriculture.

"*Resolved*, That we insist upon the continuation of the said governmental inspection, tagging and certification of all domestic animals for the interstate or export trade, to the end that the whole world may be guaranteed that the domestic animals of the United States are free from all infectious or communicable diseases.

"*Resolved*, That we demand of our Representatives in Congress that they enact laws requiring as rigid inspection and certification by foreign governments of edible commodities exported by them (wines, liquors, etc., inclusive) to the United States, as they require from the Government of this Republic, as to the wholesomeness and healthfulness of American cattle, swine and other products, in whatsoever shape they may be exported.

"*Resolved*, That in the event that Congress be not convened in extra session, that we most respectfully but earnestly ask the President that he take such action as may give the desired relief, as authorized by the fifth section of the act of 1890, relating to the inspection of meats for exports.

"*Resolved, further*, That it is the sentiment of this association which passes these resolutions that these demands are non-partisan, and are made with the request that there will be a general concurrence of expression on the part of all the producers and dealers in live stock throughout the country.

"*Resolved*, That the President and Secretary of this meeting be and are hereby requested to furnish these resolutions to the papers, and also send a certified copy of the same to the President of the United States, and to the United States Department of Agriculture.

"*Resolved*, That the Texas Cattle Raisers' Association most heartily appreciate the action of the Department of Agriculture in its experiments, now being carried on at King's ranch, in this State, in investigating the most effective method of disinfecting Southern cattle so as to prevent their communicating Southern or splenic fever, and that we respectfully ask the Department to continue said experiments and investigations until a thorough test of said methods of disinfection has been made, and that a copy of this resolution be forwarded to the Hon. J. Sterling Morton, Secretary of Agriculture.

"WHEREAS, Believing that the opening of the Nicaragua Canal would redound not only to the great material benefit of the live stock industry of this State, but to the agricultural and commercial interests as well, therefore be it

"*Resolved*, That we request our Legislature now in session to urge our Senators and Representatives in the Congress of the United States to give their active and vigorous support of all proper Federal legislation which will further and promote the speedy opening of said canal.

"WHEREAS, It being most urgent to have the present law, creating a Live Stock Sanitary Commission, revised and perfected, so that it may be made more efficient to effectually accomplish the purpose for which it was created; and

"WHEREAS, There is now pending a bill before the Legislature covering the desired and necessary legislation; and whereas, there is imminent danger of a general quarantine against Texas cattle by the United States government and the other States,

"*Resolved*, That the Legislature be earnestly urged to take up and pass said bill at the earliest possible moment, and that a copy of this resolution be sent by the Secretary immediately to the President of the Senate and to the Speaker of the House of Representatives."

The various resolutions were agreed to.

The election of officers was then in order, and G. W. Fulton nominated A. P. Bush, Jr., for re-election. After several other seconds, T. A. Thompson seconded the nomination, and put the motion that it be unanimously approved, and this was done with a whoop.

President Bush felt the pressure of the oft-repeated compliment too much to attempt an expression of his thanks, but he made a very effective effort, anyway.

C. R. Breedlove had been sitting as quiet as an old mouse in a cheese trap, but he could stand it no longer, though he had intended to keep still. He thought a bachelor was, at best, a disjointed fragment, but the association had found the best specimen of the animal he had ever seen in its President. The speaker had found another good man for First Vice-President — one who was broad-gauged — not one of those little narrow fellows, so narrow between the eyes that if you struck between them with the forefinger you would hit both eyes, but a liberal, energetic man, from South Texas, who had done more good hard work trying to find what splenic, or so-called Texas, fever was, than any man in the State, and that was Robert J. Kleberg, the gentleman from the land of ticks. Mr. Kleberg was elected without opposition.

S. B. Burnett was re-elected Second Vice-President; J. C. Loving, for the nineteenth time, re-elected Secretary; E. B. Harrold was re-elected Treasurer, and the work of the election was done.

At the second day's session, Mr. G. W. Simpson, of the Fort Worth Packing Company, made a speech containing several historical references, which we reproduce. "Thirty years ago Chicago started in with three hundred and ninety thousand cattle annually. There were then no railroads, no steamship lines for taking this product to different parts of the world, and Fort Worth has to-day more than five hundred thousand cattle passing here annually. She can produce the beef at about one-half what Illinois can. Fort Worth is the only great live stock centre from which it is practicable to ship to all of the other great markets in this country and on the other side of the water. In starting from here you can ship to Kansas City, St. Louis and Chicago. It is not practicable to ship from St. Louis to Kansas City, but it is practicable to take Fort Worth and ship to any other spot on the face of the earth, and ship direct.

"The time has come when this product has got to be shipped direct to market in order to make it profitable. The experience of England in the matter of wheat is an example of this. Parliament, after much discussion, decided that they were paying too much for wheat, and asked: 'Why shouldn't we keep some of this money at home?" The result was that they began to experiment, and to-day the price of wheat is at the very bottom, simply because England is not a buyer. She has transferred her custom to Australia and others of her colonies.

"I was speaking to a gentleman from Chicago, and he stated to me a day or two ago that the people would go down further into their pockets during a panic to buy meat, than for any other thing that there was known in the world that he knew of. That was demonstrated last summer. The banks would lend money to move meat products when they would not lend it out for any other purpose. Now, it seems to me that the thing for Texas to do is to utilize what she has got. She has got at her own door deep water. I don't know which is the most practicable point to ship from. That is for you to decide. There is room for New Orleans, Galveston, Aransas Pass and one or two more. There was two hundred and thirty-five thousand cattle fed in Texas this last year. I think I will be justified in saying that fifty thousand of those cattle were good enough for export. I hope I can say more than that. Six hundred thousand cattle could be fed in Texas on the cotton-seed oil meal. She should export two hundred thousand cattle, and will certainly do it if the present rate of increase is kept up. Whoever lives to see 1900 will see more cattle fed in Texas than in any other country in the world. Texas can produce more meat than any two States in the Union, and produce it very much more cheaply.

"I think these are facts. When you see successful business men start and come down to Texas every year to attend this Convention you are very sure they are not here for their health. You are pretty sure you have got something here they want. They buy your stock cattle for those Northern markets and you turn everything loose and let them go up there. There is a gentleman who has some very fine cattle in Ardmore. They are handled as well as any cattle in the State. I think that he was going to ship some of them to Chicago. They were left over one day in Kansas City. On account of their poor condition there was just one buyer that bid on them. They found their way through to New York and were slaughtered. It is a shame to allow property to be so treated. He might have got a less rate in four days direct by Memphis and Cincinnati to New York. They would not be exposed to any cold until they got to Cincinnati. I simply say that this product that you have got should go direct to the market where it is to be consumed. This would be accomplished if you would offer the cattle here. We need your co-operation in making this the third largest market in this country within five years. You can produce the cattle. There was never a time in the history or the business when every condition was so favorable for the shipment to the home market as it is right now. Although the demand for beef is light on account of the dull business, there has been an advance of more than twenty-five per cent within the last thirty days. There is now a great shortage in cattle. Every market has been sending out circulars trying to get people to ship to them, but they cannot ship the cattle unless they have got them. Instead of sending them to one market and letting them send them to another, they should be sent direct. Chicago is a good market. It is well established and is not going to be affected by anything we do. But what we want is a closer one, from which the product can be sent direct to the consumer. Do not let them be tossed around like a football from one market to another."

After a very enthusiastic conclusion of regular business, it was decided to meet again in Fort Worth next year, although both Dallas and San Antonio were competitors for the honor.

Second only in importance and influence to the Texas Cattle Raisers' Association is the Texas Live Stock Association, which was organized in the city of Austin about four years ago, with a very small membership. Its growth since that time has been rapid, until now it includes within its membership very nearly all the men engaged in the live stock industry in Southern and Southwestern Texas, together with a large number from the northern portion of the State.

The members met in annual Convention in February, at San Antonio, when some very valuable papers were read. Mr. Thomas H. Franklin, in his address of welcome, was strictly practical. He said:

"Mr. President and Gentlemen of the Convention: I bring to you the greetings and hearty welcome of the people of this city. We have taken our front door from its hinges, and the house stands open to receive you. Come in, sit down in our best rocker, put your feet on the jamb of our fireplace, spit tobacco juice on our coals and make yourselves 'to hum.'

"It seems superfluous to welcome a 'cowman' to our city. San Antonio is your natural headquarters. Your interests are its interests, and its interests yours. A large portion of the country tributary to it is only fit for grazing purposes, and must be used by the stock raiser or lie idle. We must look to the ranchman to make such lands productive. Every calf raised on them adds somewhat

A HEADQUARTER RANCH.

to our wealth. Even the hide from the starved steer has for us a value. Your cows never get so old or poor that our butchers will not buy them, and as a market for tough stags San Antonio has no equal in the world.

"In the utilization of these grazing lands the cowman struggles with drought, fights with the summer's heat and contends with the winter's cold, and he is entitled to our sympathy, and to him is due our aid and encouragement. The cowboy and the shepherd are the advance guards of civilization. All new countries are pastoral before they become agricultural, and agricultural resources are developed before manufactories appear. The man with the rope always precedes the man with the hoe. The cowpony beats a path across the prairies before the sod feels the point of the plow. This is as true to-day as it was in the days of the patriarchs. The farmer follows ever at the heels of the stockman, and wherever new land is found fit for cultivation, the tiller of the soil soon seizes hold and turns pasture into farm.

"The history of the cattle industry in this State demonstrates the truth of the preceding assertion. Not many years ago your herds covered the plains and valleys, but the farmer found that beneath the waving grass there was a soil that would raise wheat, corn, oats and cotton, and he came with his plow, and you moved further on with your cattle. Whatever he asked of the State, in the way of restricting your right to acquire land and enlarging his privilege to obtain it, he got. The twelve acres necessary to raise a cow, if fit for cultivation, will produce more wealth for the country if utilized for agricultural purposes than if used for grazing land. A wise public policy demands, therefore, the use of agricultural lands for agricultural purposes. The farmer is in the majority, and majorities rule. In a contest for occupancy of tillable land the cowman must succumb to the farmer. Victory to the cattleman in such a contest would be barren of good results, for it would not pay him to raise one cow on twelve acres of land when he could turn farmer and grow at least four bales of cotton or two hundred bushels of wheat on the same land. In the future, cattle raising as an industry must be carried on upon the uncultivable lands of the State. We must look to the cattlemen to make those lands wealth-producing, and there is no city more interested in the successful utilization by you of such lands than San Antonio. The farmer is likewise directly interested in the use by you of those untillable lands for grazing purposes. In connection with his farm he can raise a few calves. It will not pay him, however, to hold and feed them until they are marketable as beeves. Our cities are not large enough to constitute veal markets, and he cannot afford to ship his veal to the larger cities of the North in competition with the small farmers of that section. He needs, therefore, a home market for his calves. This the cattlemen can give him if the bodies of grazing lands heretofore referred to can be successfully utilized by him.

"How to accommodate the cattle industry to this new condition is a question before you for solution, and we are all interested in its successful solution by you. I believe in your capacity to successfully solve the problem. A cowman generally meets any emergency that presents itself. When Laban attended the first 'round-up,' after he had traded with Jacob, he found that most of the spring calves belonged to Jacob. Let me suggest one matter for your consideration, however. These barren lands must be used in large bodies in order to prove profitable, and it will take large capital to so use them. Individuals will hesitate before they will risk all their capital in any large undertaking. The tendency of the times is to push such enterprises by combined effort and capital. No one man would undertake in this day to build a railroad, establish a factory or engage in a mining enterprise. This tendency is recognized in the legislation of this State, and the creation of corporations permitted to construct roads, build bridges, run ferries, maintain stage lines, supply water and gas, to manufacture and mine, to sell merchandise, to establish hotels, to grow and sell seeds, trees and other articles for agricultural and horticultural purposes, and to hold lands for such purposes, and to do many other things, including even the burying of the dead. The cowman, however, is not permitted to incorporate for cattle-raising or pasturing purposes. In view of this condition, can individual enterprise successfully utilize the untillable lands of Texas for cattle-raising purposes? If not, these lands must cease to produce wealth, or the State must permit the creation of corporations for their utilization.

"I am aware that to many the word 'corporation' causes more terror than did Banquo's gory locks to Macbeth, but we are living in a material age and in an era of close competition, and beautiful theories must go down before sturdy facts. The modern Mohammed no longer calls to the mountain; he goes to it, burrows through it or marches over it. When the rushing river dashes away the bridge of solid masonry that spans it, we do not rebuild the bridge on the same plan, but swing high above the reach of the waters a structure of steel, seemingly as frail as the web of a spider, but in reality so strong that it easily withstands the pounding of the wheels of many loaded trains of cars daily.

"If, therefore, the choice lies between the death of a great industry and a new life being given to it by changing the methods by which it may be conducted, should we hesitate in our choice? When the nose is cut off to spite the face, neither nose or face is benefited by the operation.

"You will better understand than I do whatever of value there is in my suggestion, and I submit it without further argument."

A. P. Bush, Jr., of Dallas, President of the Texas Cattle Raisers' Association, responded to the address of welcome. He spoke of the kindly feeling entertained by stockmen toward San Antonio, and said they all felt at home in the Alamo City.

In the course of his address Mr. Bush furnished the following figures relative to the cattle industry in Texas:

The total acreage of the cattle district in one hundred and thirty-five counties, including the coast counties, is 112,249,600 acres. Total cattle rendered in same in 1890, 4,451,760. Total cattle rendered in same in 1894, 3,149,550. Total number of acres owned by State August 31, 1894, 21,688,622. Total number of acres leased and in good standing August 31, 1894, 4,757,179.

Average number of acres for each head of cattle in the range or cattle district of Texas, Comptroller's report for 1890, was 24.25. Average number of acres for each head of cattle in the range or cattle district of Texas, Comptroller's report for 1894, was 35.65. Decrease in number of cattle in above district from 1890 to 1894, was 1,302,330, showing 41.34 per cent more in 1890 than in 1894.

These renditions were made in the spring of 1894, before stockmen realized the extent of the losses during the winter and spring of 1893-94.

The above counties contain sixty-five per cent of the area of the State. In 1894 above counties contained seventy-one per cent of the cattle of the State.

In 1892 it was estimated that Western Texas contributed to the support of the State Government in taxes $300,000 more annually than she received back in the distribution for current expenses. Since the report of the Commissioner of the General Land Office, August 31, 1894, from which the statement of lands leased and owned by the State was taken, there have expired, been canceled and subject to cancellation of leases up to February 5, 1895, 1,438,907 acres, which would reduce the lease above to 3,318,372, as the bulk of these cancellations is in the counties named above.

Added to lands owned by State August 31, 1894, 21,688,622, are forfeitures for non-payment of interest for 1893, under the act of 1887, reported February 1, 1895, 2,278,400. Total now owned by the several funds, 23,967,022, of which there are now leased and in good standing, 3,536,818, leaving non-revenue producing, 20,430,204.

Total school lands, 23,967,022 acres, at two cents per acre would produce an annual income of $479,340.44. Now producing under present laws, $187,978.76. Annual loss, were all the lands leased at two cents, $371,361.68.

Secretary George B. Loving, brother of the Secretary of the Texas Cattle Raisers' Association, read the annual address of the President as follows:

"I congratulate you upon the improved condition of the live stock industry of our State since our last Convention. At our last annual meeting it was estimated that Texas had two hundred thousand head of cattle on cotton-seed meal, and that these cattle would lose to their owners an average of ten dollars a head, or two million dollars. This season it is estimated that another two hundred thousand Texas steers are being fed on cotton-seed meal, and that the average net profit on these cattle will be ten dollars a head, or a total of two million dollars. The difference between the loss of two million dollars one year ago and a profit of two million dollars for the present feeding season makes a difference of four millions dollars—quite a little sum when we consider that the cattle-feeding business represents only one department and one special feature of the great live stock industry of the State. Not only are the cattle feeders in a prosperous financial condition, but the ranchman, the speculator, the shipper, dealer and all others connected directly or indirectly with the cattle business have, with few exceptions, had a prosperous year and are well satisfied with the results. The cattle business has probably been the most profitable branch of our live stock industry for the past year; yet with splendid seasons, an abundance of grass and all other conditions reasonably favorable, the sheepmen, the horse raisers and the hog growers have been reasonably prosperous, in fact remarkably so, as compared with other branches of agriculture.

"I also congratulate you on this our fourth annual Convention, on the growth and prosperity of our organization. Three years ago our association was organized in the city of Austin, with a small membership indeed. The few who then put their shoulders to the wheel have worked faithfully and industriously to further the objects and promote the welfare of this organization until, notwithstanding

serious droughts and financial panics through which it has passed, our association is to-day in a flourishing and prosperous condition, and has been instrumental in doing much good for the industry it represents. The good work of our association, however, has just begun. It will become more useful and of greater value to the live stock interest with each succeeding year, provided the stockmen will give it their moral and financial support.

"Looking back over the year just closed, and anticipating the one that has just begun, I can see naught but cause for congratulation. In the throes of a nation's, aye, a world's, financial struggle, the live stock interest, in company with every other industry, has suffered; but, I am glad to say, that by actual comparison not in the same marked degree as other and less stable industries. Throughout the great financial crisis there has never been a time when the owner of live stock was in danger of wreck and starvation, and during 1894 the cattle values, and swine values especially, were higher in comparison with other industrial products than gold was over silver. The Texas stockman, more than his fellows of other States, has peculiar cause for congratulation. The many changes which the live stock business has undergone during the year gone by has in each and every instance been to the advantage of the Texas stock raiser, and what has been the loss of the stockmen of other and less favored sections of this great country has been the Texan's gain. The last half of 1893 and the first half of 1894 held forth but little promise to the Texas stockman. A general drought, a paralyzed money market, extended labor troubles, high prices of feed and the losses of years before, caused him to grow sick at heart when he contemplated the future. A change, however, the past summer, brought abundant rains to the greater part of the State. In an incredibly short time we had excellent grass and crops in abundance that the farmers have not even to this hour been able to finish harvesting. Labor troubles were suspended, the laborer resumed work, and as working people must have meat, a demand was created for Texas' supply of this commodity. The banks opened wide their coffers of hoarded wealth, and invited the business of the stockmen. The country has been scoured from one end to the other for cattle, for hogs and for sheep to eat the great surplus of stock feed the State produced; and on account of the great quantity and the resultant reasonable prices asked by the feed raisers, feeding has been done at a profit, and, as above stated, the net profit on all cattle fed this season will probably average ten dollars a head, as against a loss of that amount a year ago. The development of cattle feeding in Texas has been one of the most wonderful and happy transformations that ever befell an industry. You are all familiar how, ten years ago, cotton seed was considered a waste product. It was a problem in the minds of the cotton raisers how easiest to get rid of the seed that piled up around the gins. Angered by his customers' refusal to haul them away, the ginner made fuel of the seed for his boiler furnace. Now the seed is of more value than the staple. The cotton seed crop of this State in 1894 would, if properly applied in that direction, fatten one million five hundred thousand cattle in ninety days' time. A few years back fed Texas cattle were a rarity; now, under the sway of cotton seed product, the people of the corn-growing States complain that the fed Texans have ruined the native market. Where Texas in former years furnished only grass cattle, fit only for canners, and shipped them all out in a few certain months of the year, she now ships each month in the year, and seven hundred and fifty pound longhorns have been replaced by the twelve hundred to fourteen hundred pound grades. Five years ago Texas raised feed for twenty-five thousand head of cattle; now she can fatten each year one million five hundred thousand head.

"But, as in all good things, the Texan will not be allowed to enjoy a monopoly of cotton-seed meal for cattle feeding. The feeders of other States have, I am credibly informed, used more than two hundred car loads of cotton-seed meal for feed from Texas alone, and from all reports they are enthusiastic over its success, and when another cotton season comes around these Northern feeders will be in the field as sharp competitors for the purchase of cotton-seed meal.

"Above all the benefits of cheapened feed and its use by the stockmen of Texas in preparing their stock for market, the lesson that they have learned and which will in the end bring them more and better returns than any other feature, is that of improving their stock. The greatest disadvantage that the Texas stockmen of every class have had to labor under in their competition in the markets of the world has been the inferiority of their stock. In days gone by the word Texan, as applied to live stock, was synonymous to scrub, and the longhorn cow, the scraggy, straight-wooled sheep, the

razor-back hog and the wiry, broom-tail broncho had each their natural habitat in Texas. Now, by force of the lessons learned by coming in competition with the thoroughbred and improved stock of other States, the Texas stock raiser has realized the importance of good blood, and is continually improving his stock by the infusion of better blood, until in a few years it will require a label to distinguish a Texas shipment of live stock from the boasted natives of other States.

"I will not trespass much longer on your time. I might tell you something of the better things that are in store for the Texas stock raisers through the establishment of packing houses in different parts of the State. The tendency of the great cotton manufacturers of the country is to move to and locate where the supply is produced. So it will be with the packeries, and when with deep water on the Gulf Coast, ships of heavy tonnage will steam for foreign points laden to the water's edge with meats from Texas slaughter houses, we will have but attained what is now in sight. My attention was early directed to the beef packing business. In 1867 William Gifford & Co., of Chicago, started a beef packery at Columbus, Tex., my brother and myself furnishing the greater part of the beef slaughtered. This, one of the earliest experiments of the kind for our State, was made by Messrs. Gifford & Co. under great disadvantages. There were no ice factories in the South and the refrigerator methods of to-day were unknown. Transportation was insufficient and likely at any time to become blocked, and the methods for feeding and handling stock were not perfected as they are to-day. The consequence was that the first year the enterprise was not a success and the second year wound up the business.

"Many experiments have been made since, and with few exceptions the same results have followed. Our attention being closely directed to this first venture caused us to study the succeeding enterprises closely, and they failed in our judgment mainly for the following reasons:

"First. A want of sufficient capital.

"Second. A want of sufficiency in the quality of beef to meet the demands of the business through the winter and spring months, when our Texas cattle that are not fed are too poor to slaughter.

"Third. A want of proper facilities in the way of transportation, rates, etc.

"There have been several efforts made to get sufficient capital on the co-operation plan by inducing cattlemen to take stock in the enterprise. All of these methods have failed, and in my judgment they must fail, for few stockmen are in condition financially to take stock to any great extent in such enterprises, besides enterprises of this character are very distinct from the line of business the producer follows and must be directed by methods with which the producer is unfamiliar. There must be a good business head, combined with experience and a sufficiency of ready and unhampered capital to meet any demand or exigency that might arise.

"With additional beef packeries, similar to the one now in operation at Fort Worth, located where refrigerated beef could be transferred to the cooling apartments of the steamers and shipped direct to foreign ports, Texas would begin to solve the problem of marketing her cattle without the heavy freight and expenses of dumping them in Chicago. I believe the opportunity to be now at hand and that it is the only relief within our reach for marketing our cattle at a reasonable price. To accomplish this we must induce capital to take hold with sufficient means and capacity to use the home supply and in some measure meet the demand and influence the business in foreign markets.

"Before closing, I want to impress the members of this association and the stockmen generally of Texas, with an idea, upon the fulfillment of which depends much of the future greatness of the live stock industry of the State, and it is in the strengthening and perpetuation of this association. The universal law of self-preservation finds its safest method in the organization of classes, and the Texas stockmen have been slow in coming together in an organization such as this is, because, that until within the past few years, the range and feeding live stock interests had but little in common. Now they are a part and parcel of each other—the range stockman looking to the farmer to raise feed for his stock, and the farmer looking to the range stockman to purchase his surplus feed. There is not a man present who will live to see the time when one of the leading industries of Texas is not stock raising, not only as an adjunct to farming, but as a range industry. But the interests of the stockman and farmer are, and ever will be, identical, and these same interests can best be conserved and promoted by organization. I would respectfully urge on every member present the necessity of securing members,

not only among exclusive stockmen, but stock farmers as well. The work of organization should be pushed with vigor."

The following report from the Executive Committee was read and referred to the proper committee:

"To the Officers and Members Texas Live Stock Association: In accordance with established usage, your Executive Committee submits the report of its acts for the past year, and also certain recommendations which we submit for your consideration.

"The committee has had but two official meetings. November 30, 1894, upon call of the chairman, we assembled in the city of Waco, and, after due deliberation, we adopted the programme of exercises to be observed at the annual meeting of the Convention.

"At the meeting our lease committee submitted the proposition whether or not it would be advisable to join a like committee from our sister association, the Cattle Raisers' Association of Texas, and make a united effort to accomplish the work assigned it. We approved the suggestion, and directed the lease committee to act accordingly.

"We submit the following recommendations:

"First. We recommend that this Convention consider the advisability of creating a number of standing committees, to whom may be referred many of the special questions affecting our interests, and whose solution would prove of value to our membership.

"Second. We recommend that the association so change its laws that some one city in Texas may be selected as its permanent home.

"Third. We further recommend that the annual dues hereafter be fixed at five dollars, and that the membership fee be abolished."

The committee appointed to recommend officers for the current year reported in favor of Ike J. Pryor, of Columbus, for President; N. Sanson, of Alvarado, Vice-President; George B. Loving, of Fort Worth, Secretary and Treasurer, and V. P. Brown, of San Antonio, Assistant Secretary; and to compose the Executive Committee the following names were recommended: N. T. Wilson, San Antonio; S. B. Moore, Flatonia; A. S. Reed, Fort Worth; J. B. Baker, Houston; J. M. Daugherty, Abilene.

Another organization which has done excellent work in a very unassuming manner is the Southeastern Texas Cattle Raisers' Protective Association. Of this organization Mr. W. J. Moore, of Galveston, is President; Mr. John Warren, of Hockley, Vice-President; Mr. F. A. Helbig, of Houston, Secretary, and Mr. J. Willeford, Treasurer. This is a comparatively young association which has just got thoroughly into working order, and is now in the second year of its work. It was established for the purpose of mutual protection of those interested in the cattle business in the Southeastern counties of Texas, to put a stop to depredations which were formerly so frequent, and to prosecute offenders when caught. The immense area over which the industry has spread makes it impossible to repress crime except by a very general organized effort. The association also takes cognizance of all matters of general interest to cattlemen, such as the best kind of grass to grow, the grades of cattle which yield most profit to raisers, the securing of reasonable freight rates and the enactment of laws to meet injustices as they arise.

The association started on a very modest scale with some twenty members. At the present time its membership is very much larger, and all the immense territory covered by its title is carefully watched. The Executive Committee consists of such well-known men as John W. Greer, Pattison; J. R. Fenn, Duke; S. E. Allen, Harrisburg; C. A. Menke, Hempstead, and H. B. English, Sealy. The Finance Committee consists of Messrs. George Pattison, Pattison; Ed. Weygand, Cypress; G. W. Davis, Webster; J. M. Frost, Houston, and J. O. Petty, Hempstead. The Hide and Skinning Committee, to which duties of great importance are assigned, is composed of the following: W. J. Magee, Houston; J. O. Petty, Hempstead; H. B. English, Sealy; J. Badke, Buckshire; G. W. Davis, Webster; J. R. Fenn, Duke; F. Hager, Jr., Hockley; P. Mischke, Westfield; N. Brookshire, Brookshire; C. A. Menke, Hempstead, and B. A. Kelly, Chenanga.

It is not suggested that all the associations of importance have been mentioned in this chapter. As stated upon an earlier page communications were addressed by the Editor to some officer of every association of which any tidings could be obtained. Where any reply was received the matter has been

taken up, but in a majority of instances references were given which did not yield results. The importance of consolidation in cattle raisers' associations has been thoroughly appreciated in recent years. It is the general opinion of all interested that the plan of establishing an organization in every township or range district is of doubtful benefit, with returns not up to the expectation of those responsible for the work. A perusal of the preceding chapters will have given some idea of the good done by the larger organizations and of the influence they have exerted from time to time upon the cattle industry.

Before concluding the subject, it seems only just to both author and readers, we mention the fact that while these papers have been in the press events of great importance to the cattle industry of Texas and the Southwest have transpired. Notably among these should be mentioned the great increase in the price of meat to retailers. So marked has been this advance during the spring of 1895 that a great deal has been heard of a possible famine in cattle and of dire results to follow. Some dissatisfaction has been caused among cattle raisers by the action of the United States Government in condemning what it has styled a combine to put up prices. As has always been the case when the price of meat has gone up, the cattlemen have not received their share of the benefit. In other words, while there has been a sensational increase in the price of meat, there has been nothing sensational in the increase in the marketable value of cattle on the hoof. Prices are very much better than they have been, and, as this history goes to press the prospects of renewed prosperity for the cattlemen of America are brighter than they have been for at least nine years. If prices for cattle had gone up during the last few weeks in the same proportions as the prices for meat, there would have been almost a repetition of the bonanza period of twelve and thirteen years ago, and even as it is, there is much cause for congratulation.

If a perusal of this history and of the events which have invariably resulted in a period of great depression following a period of activity and better prices, should lead to a steering clear of the errors into which it has been so easy but so disastrous to fall, the object of the writer and publishers will have been more than attained. There are certain laws to which all trades and professions are subject, and it is impossible to break any one of these laws without paying the inevitable penalty. In the cattle industry the error has generally been an absolute ignoring of the fact that supplies cannot for any length of time exceed demand without a rapid fall in prices. To what extent combinations, which have just kept within the letter of the law, are responsible for the periodical fall in prices for cattle in the past, this deponent sayeth not. A committee of the United States Senate solved the problem a few years ago to its own satisfaction. No particular result followed, however, and opinions are divided as to the wisdom of the appointment of the committee in the first place, and whether the good or the evil that it did has the more outlived it.

As stated in the introduction, both sides—in some cases, a great many sides—have been given prominence in the historical chapters. With a subject so broad, an interest so prodigious, and a difference of opinion so marked and conspicuous, this was the only possible course open to the writer. A comparison of the different opinions may not convince even the majority of the readers as to which is right and which is wrong, but it will at least show them what has been attempted in the past and the measure of success which has attended various efforts. It is a notorious fact that only the careful student of history can be even approximately successful as a statesman or a diplomatist. In our opinion it is only the cattleman who studies the history of the cattle industry, and thinks out for himself both cau seand effect, that can hope to rise above the level of mediocrity, and to continue prosperous in bad times as well as good.

THE COWBOYS' CHRISTMAS BALL.

BY

LARRY CHITTENDEN, POET RANCHMAN.

TO THE RANCHMEN OF TEXAS.

'WAY out in Western Texas, where the Clear Fork's waters flow,
Where the cattle are "a-browsin'," an' the Spanish ponies grow;
Where the Northers "come a-whistlin'" from beyond the Neutral strip;
And the prairie dogs are sneezin', as if they had "The Grip";
Where the coyotes come a-howlin' 'round the ranches after dark,
And the mocking-birds are singin' to the lovely "medder lark";
Where the 'possum and the badger and rattlesnakes abound,
And the monstrous stars are winkin' o'er a wilderness profound;
Where lonesome, tawny prairies melt into airy streams,
While the Double Mountains slumber, in heavenly kinds of dreams;
Where the antelope is grazin' and the lonely plovers call—
It was there that I attended "The Cowboys' Christmas Ball."

The town was Anson City, old Jones's county seat,
Where they raise Polled Angus cattle and waving whiskered wheat;
Where the air is soft and "bammy," an' dry an' full of health,
And the prairies is explodin' with agricultural wealth;
Where they print the *Texas Western*, that Hec. McCann supplies
With news and yarns and stories uv most amazin' size;
Where Frank Smith "pulls the badger" on knowin' tenderfeet,
And Democracy's triumphant, and mighty hard to beat;
Where lives that good old hunter, John Milsap, from Lamar,
Who "used to be the Sheriff, back East, in Paris, sah!"
'Twas there, I say, at Anson, with the lively "Widder Wall,"
That I went to that reception, "The Cowboys' Christmas Ball."

The boys had left the ranches and come to town in piles;
The ladies—"kinder scatterin'"—had gathered in for miles.
And yet the place was crowded, as I remember well,
'Twas got for the occasion at "The Morning Star Hotel."
The music was a fiddle an' a lively tambourine,
And a "viol come imported" by the stage from Abilene.
The room was togged out gorgeous—with mistletoe and shawls,
And candles flickered frescoes around the airy walls.
The "wimmin folks" looked lovely—the boys looked kinder treed,
Till their leader commenced yellin': "Whoa! fellers, let's stampede!"
And the music started sighin' an' a-wailin' through the hall,
As a kind of introduction to "The Cowboys' Christmas Ball."

The leader was a feller that came from Swenson's Ranch,
They called him "Windy Billy," from "Little Deadman's Branch."
His rig was "kinder keerless," big spurs and high-heeled boots;
He had a reputation that comes when "fellers shoots."
His voice was like a bugle upon the mountain's height;
His feet were animated, an' a *mighty, movin' sight.*
When he commenced to holler, "Neow, fellers, stake yer pen!
"Lock horns ter all them heifers, an' russle 'em like men.
"Saloot yer lovely critters; neow swing an' let 'em go,
"Climb the grapevine 'round 'em—all hands do-ce-do!
"You Mavericks, jine the round-up—Jest skip her waterfall!"
Huh! hit wuz gettin' happy, "The Cowboys' Christmas Ball!"

The boys were tolerable skittish, the ladies powerful neat,
That old bass viol's music *just got there with both feet!*
That wailin', frisky fiddle, I never shall forget;
And Windy kept a-singin'—I think I hear him yet—
"O Xes, chase your squirrels, an' cut 'em to one side,
"Spur Treadwell to the center, with Cross P Charley's bride;
"Doc. Hollis down the middle, an' twine the ladies' chain,
"Varn Andrews pen the fillies in big T Diamond's train.
"All pull yer freight together, neow swallow fork an' change,
"'Big Boston' lead the trail herd, through little Pitchfork's range.
"Purr 'round yer gentle pussies, neow rope 'em! Balance all!"
Huh! hit wuz gettin' active—"The Cowboys' Christmas Ball!"

The dust rlz fast an' furious, we all just galloped 'round,
Till the scenery got so giddy that Z Bar Dick was downed.
We buckled to our partners, an' told 'em to hold on,
Then shook our hoofs like lightning until the early dawn.
Don't tell me 'bout cotillions or germans. No, sir 'ee!
That whirl at Anson City just takes the cake with me.
I'm sick of lazy shufflin's, of them I've had my fill;
Give me a frontier break-down, backed up by Windy Bill.
McAllister ain't nowhar! when Windy leads the show;
I've seen 'em both in harness, and so I sorter know—
Oh, Bill, I sha'n't forget yer, and I'll oftentimes recall
That lively gaited sworray—"The Cowboys' Christmas Ball!"

[From "RANCH VERSES," by permission of the Publishers. G. P. Putnam's Sons, 27 W. 23d street, N. Y.]

INDIAN DEPREDATIONS.

NOTE.—The following chapter on Indian Depredations was compiled largely from the many incidents which were related to the representatives who traveled through Texas gathering biographical sketches for this volume, while the works of Yoakum, Wilbarger, Ford and other Texas historians have been drawn upon for a more complete presentation of facts and details. It very appropriately follows the history of the Cattle Industry, and was prepared by Mr. S. D. Barnes, the editor of a majority of the biographies which appear in the subsequent pages.

LESS fortunate than the pioneers of other portions of the West, the early cattlemen of Texas were forced to contend not alone with the wild tribes which originally inhabited the lands they coveted, but from time to time their homes and herds were raided by the remnants of the warlike nations of the Eastern forests, held by the United States Government, under a pretense of restraint, on the borders of the Lone Star State. Historians agree that few depredations were committed by Indians upon the persons and property of the first American colonists introduced by Moses and Stephen Austin, under the Spanish and Mexican *regimes*, while practically the last raids made upon Texan soil were by bands from the reservations north of the Red River. With a foe that they could follow and chastise in his own retreat the Texan cattlemen knew how to deal; but they were powerless when annoyed by bands that could evade pursuit and find safety amid the peaceful (?) surroundings of a Government Agency. The Texas Indians were practically disposed of at an early day, but in the Northwestern counties, within striking distance of the Indian Territory, depredations were of frequent occurrence until late in the '70s.

As far back as 1690, missions had been established by the Franciscan monks, under the auspices of the Spanish Government, among the Indian tribes of Eastern Texas and at points along the Rio Grande, and during the next forty years others were founded near the Gulf Coast and as far in the interior as San Antonio. To the good offices of the Franciscan fathers, or, perhaps, to the prowess of the military forces by which each mission or presidio was guarded, may be attributed the immunity from danger experienced by the American settlers who afterward established themselves in the vicinity of the points mentioned. The Eastern Indians, the Aas, Adaes, Orquisacos and Nacogdoches, and other subdivisions of the great Caddo family, occasioned the early settlers but little trouble, while they were often of great assistance against marauding bands from the hostile tribes of the Western plains. The Caranchuas, who roamed on the gulf prairies and inhabited the islands between the mouths of the Brazos and Nueces Rivers, were more warlike than the Caddos, and were held in great dread by the Spaniards, who believed them to be cannibals, and consequently took good care to keep out of their clutches. Latterly, the tribe was nearly exterminated by the Lipans, and the few survivors confined themselves for safety to the islands along the coast, subsisting principally upon fish and oysters, and relinquishing the pursuit of game almost altogether.

The Lipans, a tribe of more consequence than either of those previously mentioned, always professed to be friendly to the whites, but this was merely a subterfuge to gain an ally against their common enemies, the Comanches. In reality they were ever ready to steal a horse or take the scalp of a white man if it could be done without danger of detection, but their professed friendship was preferable to open hostility, and, like the Caddos, the Lipans were often of service as trailers and scouts in expeditions against other tribes. As a distinct people, the Lipans have been extinct for many years. Their alliance with the whites was of no avail in the end, for, though it delayed, it could not avert their final doom.

Even the Comanches, whose hatred of the Spaniards and Mexicans dates back to the first Spanish occupancy of the country, were willing to extend the hand of friendship to the Americans during the

early days of colonization. An experience showing the existence of this friendly spirit occurred to Stephen Austin in 1822, when en route from San Antonio to the City of Mexico to conclude arrangements for his land grant. Incautiously building a fire one morning, against the advice of his guides, the smoke was observed by a band of fifty or more Comanches, and he was surrounded, captured and robbed of his entire belongings. With great presence of mind, Austin approached the chief of the party, declared himself an American, and reproached the Comanche for his act of treachery to a friend of his people. The plea proved effective, every missing article was restored, and Austin was allowed to pursue his journey in safety and peace. Eleven years after this event, in 1833, Mary Austin Holley, a resident of Texas, wrote of the Comanches as follows: "Though fierce in war they are civil in peace, and they are remarkable for their sense of justice. They call the people of the United States their friends, and give them protection, while they hate the Mexicans, and murder them without mercy." However, as early as the date last mentioned, the Comanches had began to view with jealousy and disfavor the increasing settlements in the midst of their hunting grounds, and their friendship for the Americans was soon lost in bitter and lasting hatred.

From a general knowledge of the Indian character it is safe to assume that there was always danger to be dreaded by the colonists, even when the tribes were avowedly friendly. An Indian who chanced to covet the horse or arms of a "white brother" would hardly hesitate at committing a murder to secure it, providing the risk of discovery and punishment was not too imminent. The first immigrants of the Austin Colony settled in Texas in the early part of 1821, and in the summer of 1823 the first murders by Indians of which we have a record occurred. The Caranchuas (or "Cronks," as the old Texans invariably called them) were the guilty parties in this instance. Three young men, Loy, Alley and Clark, had been down the Colorado River in a canoe to purchase corn, and the Caranchuas, who were encamped at the mouth of Skull Creek, fired upon them as they returned, killing Loy and Alley, and wounding Clark in seven places. The latter escaped by swimming to the opposite bank and managed to reach the settlement. That same evening the Caranchuas fired upon another colonist, a Mr. Brotherton, but he eluded them by dismounting and hiding in the bushes, though his horse and gun fell into their hands. A party of fourteen whites was immediately gotten together, and at daybreak the following morning they surprised the Indians in their camp, killing nineteen out of the band of twenty-one warriors. In 1824 other murders were committed by the Caranchuas, the victims being emigrants, passing from the mouth of the Brazos to the settlements on the Colorado, and Captain Randall Jones, with a company of twenty-three men, was ordered to visit the Caranchuas' camps on the Brazos, and to attack them if they exhibited signs of hostility. As he passed down the river in boats, several small parties of Indians visited him, but professed friendship, and he learned from them that about thirty of the tribe were encamped near at hand, and that ten or twelve more had gone to the settlements to purchase ammunition. Captain Jones at once sent a message to the settlements for reinforcements and to notify the settlers of their danger, but the colonists had already taken the alarm, and his messengers arrived among them in good time to take part in an attack on the visiting redskins, in which several Caranchuas were killed and the others driven from the vicinity. Meanwhile Captain Jones had, by a good deal of trouble and risk, located the main camp of the Indians, and had approached it so closely that he heard the warwhoops and howlings that welcomed the return of the defeated party, bringing with them their dead and wounded. When the whites made their attack next morning they found themselves outmatched in numbers and position, the Indians taking shelter in the tall grass from which they could return their assailants' fire with very little risk to themselves. The whites were at last forced to retreat with a loss of three men killed, the Indians' loss being about fifteen. During the course of that same year the Caranchuas received another drubbing, and growing tired of warfare, they voluntarily proposed to make a treaty, and to their honor, be it said, they held strictly to its provisions as long as the tribe could claim existence as such.

It was also in 1824 that the Wacos killed Captain Tumlinson, who resided on the Colorado, near the present town of Columbus. He had started to San Antonio with a companion and was attacked close to where Seguin now stands. Newman, his companion, escaped, and upon carrying the news of the murder to the settlements he led a search for the body, but it was never recovered. Later on, Captain J. J. Tumlinson, a brother of the murdered man, led a party of eleven Texan youths against a

LIBRARY

band of Wacos, encamped some fifteen miles from Columbus, and of the thirteen Indians twelve were killed before they could raise a hand in defense. Such was the punishment commonly meted out by the Texans to Indian murderers, and in a majority of cases it was prompt as well as effective.

One of the first encounters with the Comanches came about, in 1827, through a mistake in judgment of an over-suspicious Texan. A war party on its way down the Brazos to steal horses from the Lipans, stopped at the house of Captain Sims, in Burleson County, and asked him to give them a letter stating that they were "good Injuns" and had behaved as such so far as the writer knew. At Captain Sims' request, a Mr. Tate, who was living with him at the time, wrote the letter as directed, but added: "From all appearances I am induced to think these Indians are going down the Colorado to steal from the settlers." The Indians continued East, to the Brazos, where they showed their "letter of recommendation" to Colonel Ross, who, upon the strength of the postscript, collected a company of men at once, and attacked and killed the entire party with the exception of two, who escaped through the speed of their horses. These survivors returned to their people, and a war party was at once sent out to seek revenge for this act of treachery on the part of the whites. Going directly to Captain Sims' home, they laid in wait for the man, Tate, who they rightly judged had caused them all their trouble, and upon his appearance, all fired upon him at once, breaking an arm and one of his legs. The horse he was riding at the time carried him into the thick undergrowth of the river bottom, and he was not pursued; the Indians doubtless thinking his wounds must prove fatal. He recovered, however, and shortly afterward returned to the Eastern States. This was the wisest course he could have pursued, for the Indians never forget an enemy, and the losses they suffered through this man's act rankled in their memories for years.

The Wacos and Tehuacanas committed a good many minor depredations during the years 1828-'9, being especially troublesome on the lower Brazos and Colorado. Several murders in the vicinity of Gonzales convinced the whites of the necessity of doing something in the way of reprisal, and three companies of fifty men each were formed, and placed under the command of Colonel Abner Kuykendall. An attempt was made to surprise an Indian camp at the mouth of the San Saba, but the approach of the command was discovered and the camp was deserted before their arrival. The troops were out thirty-two days and suffered many privations, and only one Indian was killed. At about this period the Wacos came in conflict with the Cherokees, who had crossed the Red River from the Cherokee Nation and made a temporary lodgment in Texas. The Wacos stole their horses, and in revenge they attacked their village, located near where Waco now stands. A fierce battle followed, and while the Cherokees were the fewer in numbers, they were armed with rifles while the Wacos had only bows and arrows. The Tehuacanas reinforced the Wacos in time to prevent their total defeat and the Cherokees had to withdraw, losing three of their number, but carrying away the scalps of fifty-five of their enemy—this being just the number of Cherokees who were engaged in the battle. They cherished an enmity against the Tehuacanas for their interference on this occasion, and the following year 120 Cherokee braves attacked the principal village of the rival tribe, situated in what is now Limestone County, and literally swept the village and its inmates from the face of the earth. The Tehuacanas had built a rude stone fortress for their protection, and taking shelter within this, they resisted the first onslaught of their foes; but the Cherokees were not to be frustrated in this manner. Collecting dry grass, they thrust it, burning, through the openings in the walls, and many of the Indians within were suffocated, while the rest were slaughtered as they sought to reach the open air. This massacre freed the settlements on the Brazos from the annoyances the Tehuacanas had before inflicted upon them, and the signal victory won by the Cherokees over a force which must have been many times larger than their own speaks volumes for the superiority of the rifle as a weapon over the powerful bows and keen lances in the use of which the Southwestern Indians were so expert.

The possession of firearms, and a readiness to use them if occasion required, was the settler's only protection at the period of which we write. The Indians were quick to place a just estimate upon the propulsive force of gunpowder and the range of leaden pellets, and the bravest of them would shrink from facing a leveled weapon. Besides, they seemed to hold an exaggerated idea of the bravery of the whites, based upon occasional deeds of desperate heroism, reports of which had rapidly spread through the tribes. Of this description was the following incident, which occurred in 1830: Jesse Burnam, one of

Austin's original "Three Hundred," had located on the Colorado, in Fayette County, in a point so remote from other settlements that he could hardly hope for other protection than that afforded by his own hardihood and knowledge of Indian nature. On the occasion referred to, Burnam was suffering with a malarious fever which confined him to his bed, and was alone, the presence of his wife and little children excepted. His horses, of which he owned a good number, were grazing in a pasture near the house, and attracted the attention of a passing band of Indians, who leisurely let down the fence and drove them forth. One of the children witnessed the theft and reported it to Burnam, who, already half crazed with fever, determined to recover the jeopardized property at the risk of his life. One horse was left him, a fine saddle animal which he had tied, as usual, in the yard, and mounting this, with his double barreled shotgun across the saddle before him, he hastened on in pursuit of the thieves. After a long chase he came in sight of his horses, hurried along in front of a dozen jubilant warriors, and in his mad desperation he determined to attack the party at once and stampede the horses, believing that the frightened *caballada* would in that case scatter, and make their way back to their home. The first intimation that the Indians received of Burnam's presence was when he fired both barrels of his heavily loaded arm in their midst, and before they could recover from their consternation he had dashed through them, with loud yells, and right among the stolen horses. The effect of this demonstration on the latter was instantaneous. They had all along objected to leaving their rightful range, and it is possible that they recognized Burnam and his horse as part of what a Texan might call their own "outfit." But be that as it may, they followed the lead their owner set them, and were soon out of arrow shot. The Indians followed for some distance, but eventually gave up the chase in disgust, and Burnam carried his recovered *caballada* home in triumph without the loss of a single animal. The Indians could never understand how a single man could show so much hardihood under the circumstances, and it is probable that Burnam himself hardly appreciated what he had done until later on. Wilbarger, who mentions this incident in his work on "INDIAN DEPREDATIONS IN TEXAS," comments on the fevered and angered condition which prompted this terrible risk, and remarks: "We can understand this, as we have been very sick frequently as well as angry, and no doubt if we had been in Burnam's place we would have done some desperate charging too—but it would have been in the opposite direction from the Indians."

The home of Charles Cavina, on Caney Creek, in Matagorda County, was attacked by seventy Indians in 1830, his wife and three daughters killed and a fourth daughter wounded. Mrs. Flowers, the wife of a neighbor who was visiting at the house at the time, was killed, while a daughter who had accompanied her was wounded. The two girls who were yet alive were thrown in a brush heap, and left for dead, but both recovered and lived for many years. Cavina returned while the Indians were still in possession of his home, and made haste to give the alarm to the other settlers in the neighborhood. A company of sixty men was raised under the command of Captain Buckner, and they came up with the Indians camped beneath a bluff on the Colorado River, where the town of Matagorda is now situated. A Mr. Morrison, sent to spy out their position, approached too close to the verge of the bluff, and tumbled down in their midst, but managed to secure shelter in a cave, and fought off the enemy until his companions came to his relief, killing five Indians with his rifle and pistols. Hemmed in, with the river on one side, and the avenging Texans on all others, the redskins could only escape by swimming, and over forty of them were left dead on the battlefield or beneath the waters of the Colorado. Later in the year the presence of another band of Indians—Wacos and Keechis—was discovered by the settlers on Caney Creek, their camp was surrounded and a bloody fight followed, one Texan and four Indians being killed. Quite a number of depredations were committed on Little River at about this same time; and the following year a party of silver seekers, who started from San Antonio to the San Saba River, narrowly escaped extermination at the hands of the Tehuacanas, Wacos and Caddos.

This party was led by Rezin P. Bowie, one of the most noted fighters of his day, and his companions were his brother, James Bowie, James Coryell, Robert Armstrong, David Buchanan, Jesse Wallace, Matthew Doyle, Cephas Hamm, Tom McCaslin and two servants. The object of the expedition was to discover the old silver mines formerly worked by the Spanish founders of the San Saba mission. The country to be penetrated was counted among the most dangerous within the limits of Texas, and on the nineteenth day out from San Antonio they encountered two Comanches and a Mexican, belonging to a

party of sixteen under the leadership of Isaonie, a noted Comanche chief, who were camped some miles away. Presents were given the Indians and their companion, who then returned to their camp, but the next morning the Mexican rejoined Bowie's party, bringing from his chief tidings that the whites were followed by one hundred and twenty Tehuacanas and Wacos and forty Caddos, and would be attacked as soon as overtaken. Isaonie urged the whites to come to his camp, and promised the assistance of his own band in case a conflict with their pursuers could not be avoided. Bowie, however, concluded to proceed on his way, hoping to reach the old fort on the San Saba, some thirty miles away. Failing in this, he chose his camp in the midst of a cluster of live oaks, further protected by a dense thicket of some size, and surrounded by comparatively open country through which an enemy could not approach without a certainty of detection. They were undisturbed during the night, but as they were preparing to set out next morning, they discovered the Indians approaching on their trail. Rezin Bowie and Buchanan went out to have a peace talk with them, but were fired upon and the latter's leg broken. Bowie returned the fire, and, shouldering his helpless companion, started back to shelter, which he succeeded in reaching, though on the way Buchanan received two more wounds. Eight Indians rushed in on foot to intercept them, but were met by the whites, and four of their number killed. Firing then became general and several Indians fell, but the assailants were kept back at such a distance that their arrows did no damage. At length fifteen or twenty Caddos, the professed friends of the whites, secured lodgment under the bank of a stream, some forty yards in the rear of the Texans, and as they were armed with rifles, their fire was at once effective. Doyle was shot through the breast; McCaslin hastened to his side, and fell dead with a bullet in his body. The Caddos were at length driven from their point of vantage, and then the white men, concealed from view in the thicket, had a great advantage over the enemy who must necessarily approach them across the open ground. After two hours hot firing, during which Coryell was wounded in the arm and side, the Indians grew tired of this course of procedure, and attempted to dislodge the whites by setting fire to the dry grass around them. The first attempt was ineffectual, for they started the fire in the wrong quarter, and the wind carried it around the thicket leaving it untouched. Warned by this, Bowie directed his men to clear the dry grass and leaves from around the baggage and the wounded men, for fear that fire might be started in the little scope that still remained untouched, and it chanced this precaution was taken just in time. An Indian crept near and fired the grass the second time, but was killed by Armstrong before he could regain his party. It was a terrible moment for the besieged men, for a wall of fire ten feet high was approaching them, and a perfect shower of arrows and bullets were falling among them as they crouched in their slight shelter. If the Indians had charged under cover of the smoke the battle would have soon ended, but from some cause they failed to do this, and as the fire reached the green foliage of the thicket, it became less fierce and was smothered out with the blankets before it got to the wounded men or the baggage among which they lay. The thicket, however, had been so badly scorched that it was almost useless as a shelter, and the whites began throwing up a rude circular breastwork around their baggage, building it of dirt and loose rocks dug out with their hunting knives and sharpened sticks. At sundown the Indians withdrew from the fight, and camped some two or three hundred yards away; the next morning leaving the locality altogether, carrying their dead and wounded with them. The whites, however, continued work on their little fort, and made preparations to sustain a siege. Late in the day a party of thirteen Indians reconnoitered their position, but finding them still able and ready to fight, hastily took their departure, and they were seen no more. Bowie's party remained eight days in the shelter of their fortification, and finally made their way back to San Antonio, their loss in the fight being one man killed and three wounded. They estimated the loss of the Indians at forty-eight or fifty.

As settlements became more numerous in the country, conflicts with Indians naturally increased in frequency. The redskins had come to look upon the colonists as their worst foes, and at the same time regarded their herds as a certain source of support when game was scarce or they were too lazy to hunt for it. Their descents upon the settlements were principally to secure plunder, and they would appropriate anything that struck them as a novelty, regardless of its value to them or its owner. Horses were what they principally desired, and if they could manage to secure a scalp while stealing a pony, why, so much the better. The settlers, in their turn, accepted the situation with true American spirit,

and adopted the motto which General Sheridan is generally credited with putting in words: "There is no good Indians except dead ones." A redskin found in the vicinity of a settlement was usually compelled to give a good reason for his presence or pay the penalty of his rashness. With such a state of affairs in existence, encounters were of almost weekly occurrence.

In the summer of 1833, a party of five young men, Josiah Wilbarger, Christian, Strother, Standifer and Haynie, left Hornsby's place on the Colorado, nine miles below Austin, intending to make a general survey of the country for several miles to the Northwest. On Walnut Creek they sighted an Indian and gave chase, but he eluded them in the hills and they turned back, halting near Pecan Spring to eat a lunch. Wilbarger, Christian and Strother unsaddled and hobbled their horses, but the others, for some reason, did not follow their example. While they were eating they were surprised by a party of Indians. Strother was mortally wounded at the first fire, and shortly after Christian received a bullet which broke his thigh, while Wilbarger had a flesh wound in his neck and was pierced through both legs with arrows. They sustained the fight for a time, partially sheltered by some small trees, when, seeing that there was no chance for them, Standifer and Haynie mounted their horses for flight. Wilbarger begged to be taken with them and had left his tree in an attempt to reach them, when a bullet pierced his neck and he fell, apparently lifeless. The Indians crowded around the fallen men and scalped all three, cutting the throats of Strother and Christian, but omitted to do this in Wilbarger's case. After they had left he regained consciousness, and managed to crawl about six hundred yards from the scene of the fight, when his strength again failed him. He was found there the next day by a party sent out to recover the bodies of the slain, and, in spite of his terrible injuries, lived for eleven years afterward, eventually dying from a disease of the skull and brain resulting from the loss of his scalp. Other cases have been known wherein persons have been scalped and recovered, but Wilbarger's recovery was particularly notable since he sustained other wounds apparently sufficient in themselves to cause death.

What is known as the "Madden Massacre" also occurred in 1833. Quite a settlement had been formed in Houston County, and on the night when the Indian attack came, several of the families were collected in a double log house. Three or four men were in one of the rooms moulding bullets, and the women and children were in the other. The only light in either apartment was that afforded by the fires that were burning on the hearths. In some way the Indians discovered that the party were divided and took possession of the hall between the rooms, some of their number guarding the door through which the men must pass to reach the outside, while the rest murdered the women and children. Seven victims fell beneath the deadly blows of hatchets and knives. Mrs. Madden was wounded several times, and as she fell, accidentally rolled beneath a bed and one of her little sons crept after. A moment later, when the fire had been extinguished by the blood of one of the murdered women, Mrs. Madden and her son crept among the Indians in the darkness and made their escape. The men in the adjoining room were unarmed and made no attempt to go to the aid of their wives and children, but fled at the first opportunity—the most disgraceful exhibition of cowardice that has ever blotted the annals of frontier warfare.

Outrages similar to that described above now became so common that in the space of the present article they can only be mentioned in a general way. The settlements were pressing North along the principal rivers, mainly confining themselves to the timbered bottoms and the Cross Timber regions, and nearly all the depredations were committed by skulking bands, which took advantage of the cover thus afforded them, and were perpetually stealing horses and harrassing the colonists in every way possible. Judge Gabriel Martin, a prominent citizen, was attacked by the Pawnees while on a buffalo hunt, and was killed, with his negro servant, while a son who accompanied him was captured but was afterward recovered by a party of United States Dragoons. The McLellan family, who had removed from Robertson's Colony to what is now Williamson County, were attacked before they had unloaded their wagon, and robbed of everything they possessed. McLellan was away from the camp with a little son, hunting, when the attack occurred. His wife and the other children were stripped of their clothing and tied, but, while the Indians were pillaging the wagon, the mother managed to loosen the cords and, with her infant in her arms and followed by her little boy, slipped away unnoticed, and took refuge in the San Gabriel bottom. Luckily she escaped the search the Indians made for her, and they finally abandoned the quest and took their departure. McLellan, returning to his camp, found his wagon

robbed and his family gone, and thinking they had been carried into captivity, turned back to the settlements, making the entire distance on foot, a terrible journey for the little boy who accompanied him. Thus deserted, the mother and her two children remained in the neighborhood of the wagon, living, as best she could, on some shattered corn found in the dust where the horses were fed, and when, several days later, her husband returned with a party to take the trail of her supposed captors, she had become so crazed with privations and mental agony that she fled from her friends and had to be run down and captured like a wild beast.

The Comanches again showed the falsity of their pretended friendship, in 1835, by killing a Mr. Lyons, in Lavaca County, and carrying his little son into captivity. The boy was returned to his friends many years later. That year also witnessed the murder of the Kitchen family, in Fanning County, of Ridgeway, near the falls of the Brazos, and of Hibbens, on the Colorado, in De Witt's Colony. The latter was just returning home with his wife and family who had been on a visit in the East. The family was attacked when just on the threshold of safety, Hibbens and his wife's mother killed, and Mrs. Hibbens and her two children lashed to a horse and forced to accompany the Indians. The youngest child, an infant, annoyed the Indians by crying, and was taken from its mother and killed. The other, being old enough to respect its mother's admonitions to silence, was spared, but mother and child were closely guarded until several days after the capture, when the Indians had crossed the Colorado and believed themselves beyond reach of pursuit. At last, one night, when her captors and the child slept, Mrs. Hibbens saw her opportunity to escape, and gently arose and slipped away in the darkness. She attempted to conceal her trail by wading down a running stream, but its windings confused her, and when she thought herself far away from the camp, she was apprised of its nearness by hearing her child piteously calling her. It was the most trying position in which a mother could be placed, but the safety of her child as well as herself depended on her reaching the settlement and giving the alarm, and she turned resolutely away, and late the next day found shelter and safety at the house of a settler. Colonel Tumlinson, with a company of rangers, chanced to be in the neighborhood, and he at once went in pursuit of the marauders, killed two of them and captured all their horses, arms and camp equipage, and also recovered Mrs. Hibbens' child.

RANCHMAN AND THOROUGHBRED PONY.

The trouble which was then brewing between the colonists and the Mexican Government attracted the attention of the authorities to such an extent that many Indian atrocities were allowed to pass without prompt punishment. Still, several organized companies of men were in the field to protect the settlements, and when they struck the trail of an Indian band they were tireless in the pursuit and unrelenting when the chase came to an end. A score of murders were committed in the district between the Brazos and Colorado Rivers, in 1836, and though the immediate perpetrators of the crimes were not always punished, it is believed that for each white man's scalp taken a half dozen Indians yielded up their lives. A complete and exhaustive history of the border warfare of that period can never be written. The green prairies of Texas had become the theatre of a drama upon which the eyes of nations rested with interest, and, compared with the wholesale butcheries of the Alamo and Goliad,

the atrocities committed by the Indians upon the defenseless families of the outlying settlements were of little importance, while such an event as the killing of a few Indians was hardly worth relating as a matter of news. Inured before to the continual presence of danger, the Texans had been transformed by the stirring scenes of their war for Independence into a veritable nation of soldiers, and, when freed from the oppressive yoke of the Mexican Government, they devoted their energies toward clearing their territory of hostile redskins. The McCullochs and Rosses, men who later distinguished themselves as Indian fighters and leaders in border warfare, were not then residents of the Republic, but there were others as brave, and as noted in their day, and as relentless in their hatred of Indians. But Texas was too great in expanse of territory, and her borders too extended, to admit of being thoroughly patrolled by a few small bands of rangers, however tireless, and the men who were in the field were kept continually moving, and in receipt of tidings of fresh depredations before they had overtaken and punished the perpetrators of the last. On one occasion a party of fifteen rangers, led by Captain Erath, attacked one hundred well-armed Indians from the north of Red River, who had penetrated as far South as Elm Creek, in Milam County, and though he was forced to leave the field through the fears of some of his men, who overrated the "staying qualities" of their opponents, the Indians had tried the temper of the Texans to their satisfaction and turned back northward with all speed as soon as the field was clear. Erath lost two men, the Indians, at least ten. Other encounters of a similar nature, preceding and following the one just mentioned, showed quite conclusively what the rangers could accomplish if occasion offered, but they were always pursuing an unwilling enemy who dared not make a stand in open ground, but confined themselves to assassinating helpless women and children, or waylaying an unarmed man as he tended his herds or cultivated the crops which was his family's only means of subsistence. Unfortunately, too, the term of enlistment of nearly all the rangers expired in 1836-'7, and through some negligence no others were enrolled until the expiration of President Houston's term in 1838. During this period the frontier settlements were, in many cases, abandoned, and not a family remained on the Little River or at the falls of the Brazos.

The Parker Fort massacre, in 1836, has been given an unusual degree of prominence in all published works on Texas, partly because of the number of people who were killed or wounded at that place, but principally on account of the romance attached to the after-life of one of the actors in this frontier tragedy. Parker's Fort had been constructed by a colony of Illinoians on the Navasota, its site being near the present town of Groesbeck, in Limestone County. It consisted of a stockade about fifteen feet high, of split cedar timbers, set deep in the ground and fastened together by other timbers at the tops. Two log cabins at diagonal corners constituted part of the enclosure while they added to its strength. The cabins were built with projecting upper stories in true block-house fashion, and were provided with port holes commanding every approach. There were also port holes in the stockade at convenient intervals. Everything had been done to make this little fort practically impregnable, for, as Fort Houston, in Anderson County, was the nearest military post, the Parker colony had to depend principally upon themselves for protection. The colony, at the time of the Indian attack, consisted of thirty-four persons, comprising the families of John, James and Silas Parker, L. M. S. Plummer, L. D. Nixon, S. Frost and G. E. Dwight and Benjamin Parker, unmarried, Mrs. Nixon, Sr., Mrs. Elizabeth Kellogg and Mrs. Duty. Old man Lunn, David and Evan Faulkenberry, Silas Bates and Abram Anglin, had built themselves homes a mile or so from the fort, but were not among its defenders on the fatal day.

On the morning of the nineteenth of May, James Parker, Nixon and Plummer started at an early hour to their fields on the river about a mile away, and they had scarcely gotten out of sight when several hundred Comanches and Kiowas appeared near the fort and signaled their desire to hold a talk with its inmates. Benjamin Parker went forth to meet them and was told that they were friendly to the whites, but that they wished to encamp in the neighborhood and must ask their kind friends to furnish them with a beef as they were very hungry. Parker returned to the fort and told the others that he believed the Indians intended to fight, but that he would talk with them further and try to avoid trouble if possible. Against the entreaties of his friends Benjamin Parker once more ventured forth and was immediately surrounded and killed. The Indians then charged upon the fort before its defenders could close the entrance against them. Wilbarger, in writing of this massacre, says: "The sickening and

bloody tragedy was soon enacted. Brave Silas M. Parker fell outside the fort while he was gallantly fighting to save Mrs. Plummer. Mrs. Plummer made a desperate resistance, but was soon overpowered, knocked down with a hoe and made captive. Samuel M. Frost and his son Robert met their fate while heroically defending the women and children inside the stockade. Old Granny Parker was stabbed and left for dead. Elder John Parker (the leader of the colony), with his wife and Mrs. Kellogg, attempted to make their escape, and in the effort had gone about three-fourths of a mile when they were overtaken and driven back near the fort, where the old gentleman was stripped, murdered, scalped and horribly mutilated. Mrs. Parker was stripped, speared and left for dead. Mrs. Kellogg was spared as a captive." Those killed, as we have seen, were John, Silas and Benjamin Parker, and Samuel and Robert Frost. Mrs. John Parker, Old Granny Parker and Mrs. Duty were seriously wounded, while those captured were Mrs. Plummer and her two-year-old son, Mrs. Kellogg, and Cynthia Ann and John Parker, aged nine and six years respectively. Early in the fight Mrs. Nixon made her escape and alarmed the men in the field, and Plummer at once made haste to summons Faulkenberry and the other neighbors, while James Parker and Nixon started to the fort hoping that they might be of some assistance. On the way Parker met his family escaping and hurried them off to a place of safety. A little further on Nixon met Mrs. Silas Parker with her four children, but at that juncture a party of Indians came up and made them all captives. The oldest children, Cynthia Ann and John, were taken up behind two of the mounted warriors, while Nixon, Mrs. Parker and her remaining children were forced back toward the fort. They were about to kill Nixon, when the appearance of Faulkenberry with his rifle caused them to fall back. The latter faced the Indians with his leveled weapon, holding them in check while Mrs. Parker retreated across a strip of prairie to the nearest woods, but just as this was reached the Indians made a charge which would have accomplished its object if other aid had not reached the fugitives. Bates, Anglin and Evan Faulkenberry, armed, and Plummer, unarmed, arrived at that moment and the Indians withdrew.

After the fort was vacated by the Indians, old Granny Parker, wounded as she was, crawled to Faulkenberry's house, where she was found that night, and after six days of terrible privations and sufferings, the entire party of survivors reached Fort Houston. The adventures of the captives would fill a volume. Mrs. Kellogg was transferred by her original captors to the Keechis, and by them to a party of Delawares, who delivered her to General Houston, some months after the tragedy, receiving one hundred and fifty dollars, the price they had paid the Keechis for her. Mrs. Plummer remained a captive about eighteen months, subjected to every indignity savage minds could devise. A child was born to her in October, some five months after the date of her captivity, but when it was about six months old her cruel masters decided that the care of the infant interfered too much with her other work, and it was taken from her and killed. The account of this horrible occurrence, given in Mrs. Plummer's own words, is in itself sufficient excuse for the relentless spirit so often exhibited by the Texans in their combats with red foemen. The child was strangled until apparently dead, and then repeatedly thrown in the air and allowed to fall on the hard ground. It was then given back to its agonized mother, under whose tender care it began to show signs of returning life. Then the Indians again tore it from her arms, tied a rope about its neck, and drew it back and forth through a cactus bed, tearing its flesh from its limbs. Finally, one of the Indians mounted a horse, tied the rope to his saddle, and galloped in a circle until wearied of the infernal sport, when the child's remains was once more given to the mother, and by her consigned to a rude grave. Mrs. Plummer was eventually ransomed by a trader who found her in an Indian camp, several hundred miles north of Santa Fe, New Mexico, and was returned to her family in Texas. John Parker grew up a veritable young Comanche, and accompanied the tribe on many raids. His return to the ways of civilization came about through the agency of a Mexican girl captured on one of the Comanches' marauding excursions. John took a great fancy to her, and his love was returned. On the way back to the Comanche village in the North, young Parker was prostrated by an attack of the small pox, and abandoned by his companions, who, as a special favor, left the Mexican girl to care for him, expecting, of course, that both would succumb to the fatal disorder, or, escaping that, perish of hunger in the wilderness where they were left. However, thanks to his sweetheart's nursing, John lived, and was induced by her pleadings to abandon the tribe, and settle down to a life of peace and happiness in a straw-thatched, mud-floored jacal by the Rio Grande.

Transformed from a warrior to a cowman, John became noted for his daring in the border conflicts, and at the outbreak of the war took sides with the Confederacy, and distinguished himself in many engagements. His sister, Cynthia Ann, spent half a lifetime with the Comanches, married the most renowned war chief of the tribe, and became the mother of a noted chieftain who still lives. Further mention of her will be made in its proper place later on.

The Parker Fort affair has been mentioned at length, because it was the first prominent instance in which the Texas settlers were made to feel the irresistible power of the allied Kiowas and Comanches, tribes which, later on, became the most troublesome and unrelenting of their foes, fighting every inch of the way as they were pressed back, northward and westward, from the grassy plains which are now the principal grazing grounds of the Lone Star State. Heretofore, the whites had only contended with the weaker tribes of the East; Indians like the Wacos, Caranchuas and others, who were usually encountered in small bands only, poorly armed, and as often on foot as mounted; while the Comanches and Kiowas counted their warriors by the thousands, were the most expert horsemen of all the aboriginal tribes, and were in many instances as well armed as the Texans themselves. The Comanches, too, had been for many years in a state of perpetual warfare with the Mexicans, and invariably the victors in encounters of importance, and consequently they possessed the assurance won by success, and held the Texans in contempt. How dearly they paid for this overestimation of their own prowess may be learned by a visit to their present reservation in the Indian Territory, and an enumeration of their diminished numbers. With the sole exception of the Apaches, the Comanches and Kiowas were the last of the Southwestern tribes to accept peace on the terms granted them by their white foemen. They will probably be the last to abandon their wild ways of life, and consent to a dissolution of the old tribal relations.

Following the establishment of Texan independence, settlements began to increase in number along the northern border. Emigrants from the Northern States, entering the Republic by way of Arkansas and Northern Louisiana, naturally turned westward to reach the prairie regions by the shortest route, and established themselves in Red River, Lamar and Grayson Counties. For a time they were undisturbed by the savages, but, in the meanwhile, depredations in the counties farther south were occurring more frequently than ever. Especially was this the case in the neighborhood of Austin, in spite of the numerous efforts at reprisal made by the organized frontier guards. In 1837 a party of eighteen Texans, under Lieutenant Vanthuysen, was surrounded by one hundred and fifty Wacos, Caddos and Keechis, and all but eight of their number killed. Sixty of the Indians were slain, and when the surviving whites charged through the savage ranks and left the field, their foes allowed them to go unfollowed. They had tested their courage and prowess to their satisfaction, and, with genuine Indian prudence, forbore from pressing the advantage gained. The power of the minor tribes above mentioned was already so thoroughly broken that they were forced to combine their strength in offensive demonstrations against the whites, but it seemed that when one enemy had been disposed of by the Texans, another and a more powerful one would spring up to annoy them. The Cherokees and their associated tribes, twelve in number—the Shawnees, Seminoles, Delawares, Kickapoos and others—had located themselves in Eastern Texas early in the '20s, and had taken up farming and stock raising to some extent, but were still only partially civilized. These tribes were suspected of sympathizing with the Mexicans during the period of the Texan revolution, but a close watch was kept on their movements, and they were not detected in any depredations of consequence until the autumn of 1837. A number of white settlers had located in the Cherokee country, and had planted and cultivated their crops, but growing fearful of danger, had sought refuge at Nacogdoches. Later several of the families ventured back to gather their ripened corn, but found the fences thrown down, and the greater part of the crop destroyed. With a reckless disregard of safety they remained to gather the remnant, and were attacked by the Indians, ten persons killed, and six taken captive. Of the Wood and Killough families, not a single person escaped. When this occurrence became known, two companies of soldiers were sent to guard the Neches and Sabine Rivers, and keep watch of the Cherokees, not allowing them to communicate in any way with the prairie Indians and Mexicans. Bowles, the Cherokee chief, resented this interference with his privileges bitterly, and notified Major Walters, who commanded the soldiers, to keep without the borders of the Cherokee country. Of course, such a state of affairs could not long

exist. Governor Houston, who had lived with the Cherokees for several years before coming to Texas, was suspected of delaying a proposed movement looking towards their dislodgment from the lands they then occupied, but even his forbearance was at last exhausted by the defiant position Bowles had taken, and he ordered General Rusk to move against him with the militia forces of the Republic. Many of the Mexican settlers on the Angelina and Nacogdoches, joined the Cherokees, and their leaders wrote Houston, disclaiming allegiance to the Texan government. In October, 1838, an engagement took place at Kickapoo Town on the Trinity River in Anderson County, with a mixed force of Mexicans and Indians, and they were dispersed with a loss of eleven killed. When Governor Lamar took his seat in December of that year, he attempted to bring about a peaceable removal of the Cherokees, or to gain some assurance from them of better behavior in the future, but failing in this, placed all his available force in the field under the leadership of such men as Burleson, Burnett, Landrum, Rusk, and Albert Sidney Johnson, the command being given to General G. K. Douglass. On the 15th of July, 1839, the allied tribes and their Mexican friends, eight hundred in number, were attacked by five hundred Texans on grounds of their own choosing on the Neches River, and, after a fight of an hour and a half, were driven from the field in confusion. The chief, Bowles, and a hundred of his men were killed and wounded. On the Texans' side five men were slain while twenty-seven received wounds, among others D. G. Burnett, the Vice-President of the Republic; McLoud, the Adjutant-General; and Johnston, the Secretary of War. No ordinary latter day office holders these, but men in the truest acceptance of the term. They had helped to create the Government, under which they held honored positions, and felt it their duty to offer their lives freely in its defense. The Cherokees, under the leadership of John Bowles and an Indian named Egg, established themselves for a few months on the head waters of the Trinity, and in the fall of 1839 attempted to lead their followers to Mexico, passing north of the settlements. Near the mouth of the San Saba River, they encountered Colonel Burleson and his command, who were on a scout after some of the prairie Indians, and in the fight which followed, both of the Cherokee chiefs were killed, with several of their followers, twenty-seven women and children were captured, and the remainder of the tribe sought safety among their kindred in the Indian Territory. Thus, through prompt and decisive measures, the Cherokee trouble was stamped out within two years of the first trouble with the tribe; and the Texans thus relieved from the presence of a dangerous enemy in their very midst, were allowed an opportunity to turn their attention to the foes that were pressing in upon them from the Western and Northern borders.

Meanwhile, the Comanches had thrown aside the mask of friendship and were committing more depredations than all the other wild tribes conjoined. Their numbers were so great that it was impossible to keep the different bands under surveillance, and consequently they could threaten the entire stretch of border at one and the same time. They seemed ubiquitous, and during the years 1838 and 1839, no inhabitant of the outlying settlements could retire at night with assurance that his slumbers would not be disturbed by the startling clamor of their warwhoops. The pioneer families in Grayson, Fannin and other Northern counties, suffered so severely from their constant raids that they abandoned their settlements and sought safety farther East. Numberless murders were committed in the counties of Nueces, Lavaca, Goliad, De Witt and Bastrop, and exploring and surveying parties venturing to inspect the fertile prairies of Limestone and Navarro, were attacked and forced to withdraw, though not without hard fought battles marked by heavy losses on either side. The most noteworthy massacre of these two years was that which occurred on the night of the first of January, 1839, at the Morgan and Marlin settlement near the falls of the Brazos. The home of George Morgan, on what is now known as Morgan's Point, several miles above the present town of Marlin, was at that time the most Northern point on the Brazos occupied by white settlers, though for a distance of twenty miles along the lower course of the stream settlements were fairly numerous. On the night in question, a portion of the families of James Marlin, Mrs. Jones and Jackson Morgan were visiting George Morgan and his family, and a little after dark the Indians rushed in upon them without a moment's warning. George Morgan and wife, Jackson Jones their grandson, Mrs. Jackson Morgan and Miss Adeline Marlin were immediately tomahawked and scalped, and Miss Stacy Ann Marlin was also severely wounded and the Indians supposed her dead, but for some reason did not take her scalp. Three children who were in the yard

when the Indians made their appearance, managed, in the confusion, to escape. One of them, Wesley Jones, first ran in the house in the midst of the scene of bloodshed, but immediately ran out again, and followed by Mary Marlin, a little girl, started for the house of John Marlin seven miles down the river, but did not reach it until after daylight the next morning. Isaac Marlin, a boy of ten years, secreted himself until the Indians had robbed the house and taken their departure, when he entered and felt the stilled pulses of his relatives and friends one by one to ascertain if any of them by chance survived. Miss Marlin was conscious but feigned death, and in the darkness mistook her brother for one of the murderers, while he also failed to discover that she still lived. He made all haste to convey the news of the tragedy to the nearest neighbor, reaching John Morgan's house hours before the other children; and the next day about noon Miss Marlin, though sorely wounded, managed to make her way to the same haven of refuge. As the news of the massacre spread, many came from the lower settlements to assist in burying the dead, but for several days no attempt to follow and punish the murderers was made. On the tenth of January seventy Indians attacked the house of John Morgan, but were beaten off with the loss of seven of their number. Then forty-eight of the settlers assembled, and after discussion, decided that their own safety required the adoption of something more vigorous than a mere defensive policy. Under the leadership of Benjamin Bryant, of Bryant Station, they took the trail of the Indians, and on the second day overtook them near Morgan's Point. The notorious chief, Jose Maria, who led the band, showed no inclination to evade the fight, but leisurely removed his gauntlets and fired the first shot, cutting the sleeve of one of the Texans. A general fight followed in which the Texans at first had the advantage, but growing over-confident of victory, they became careless, and taking advantage of this the Comanche chief suddenly led his warriors to the attack, driving the whites back in confusion. Ten of the Texans were killed and five wounded, and the Indians suffered a loss fully as great, but they were victorious, and were afterward more troublesome than ever, until, some months later, they met with a crushing defeat. It may be mentioned here, however, that the old chief, Jose Maria, eventually became one of the most peaceful and friendly of the Indians on the Government Reservation, and on a subsequent visit to Bryant Station enjoyed the pleasure of a "council smoke" with the leader of the Texans in the above-described fight, gravely accepting the honor of the first puff, this being his due as the victor.

On the twenty-seventh of May, 1839, Captain John Bird, at the head of thirty-one rangers, left Fort Milam, on the Brazos, and crossed to Fort Griffin, on Little River, where he was told of the presence of Indians in the vicinity and at once proceeded in pursuit of them. Shortly afterward they came upon twenty-seven Comanches who were skinning buffaloes. They scattered before the Texans' charge but afterward assembled and made a short stand and again fled, hotly pursued by the rangers. Finally, giving up the pursuit, they started back, but at Bird's Creek, seven miles northeast of the site of Belton, they were ambushed and surrounded by about forty Indians who poured in a deadly shower of arrows. The rangers managed to reach a ravine in which there was a spring, and here they made a stand, while the Indians took possession of a hill top about three hundred yards away and sent up "signal smokes," which were replied to from three different directions, and in a short time three hundred warriors were assembled under the leadership of Buffalo Hump, one of the most noted war chiefs of the Comanches. They approached the ravine in force, and halted a short distance away, that the Texans might see and be impressed with their strength. This movement failed of its object, for the rangers knew that the only course open for them was to fight as long as a man was left, and though, perhaps, despairing of meeting the savage horde successfully, they faced the inevitable with a cool bravery that nothing could daunt. Twice the Indians charged, and both times were driven back with heavy loss, the slopes of the ravine becoming dotted with their dead. Before making a third attack they retreated out of rifle range, and dividing their force, once more rushed in, charging from two sides at once. This was repeated again and again, but each time the steady fire of the rangers checked the charge. All this time the arrows had hailed around and among the gallant group by the spring. Captain Bird fell dead early in the fight, and six of his followers were dead or so badly wounded as to be of no further assistance to their comrades. The rangers had made one of the bravest fights in the history of border warfare, but were still outnumbered ten to one, and the steady strain upon their nerves

was having its effect. At this juncture, James Robinnett, one of their number, took the lead and cheered the men to continue the struggle. He told them that victory so far was with them. They had resisted the first rushes of the Indians when flushed with a consciousness of their superior force and assured of an easy triumph, and that if the long struggle had wearied them it must naturally have wearied their enemies still more, since they were continually in motion and had met discouragement at every turn. If the Texans could pick off some of the leading Indians the day would certainly be theirs, and Robinnett took an oath to kill the chief in the next charge at the risk of his own life. The charge came and he redeemed his vow. At the report of Robinnett's rifle, Buffalo Hump threw up his hands with a yell and fell from his horse, his immense head dress of buffalo horns rattling in the dust. His warriors bore the body from the field, and though they returned once more to the charge it was in a half-hearted manner and were easily repulsed. Under cover of the ensuing night they withdrew, and the next morning the surviving rangers made their way to Fort Griffin. Five of their number were killed, and they estimated the Indian loss at not less than one hundred.

This defeat was a hard blow to the Comanches, and they had received another drubbing earlier in the year at the hands of an allied party of Texans and Lipans. The Comanches were in winter quarters on the San Saba, and were discovered by their old enemies, the Lipans, who immediately carried the intelligence to the settlements. A party of sixty whites, led by Colonel John H. Moore, at once started for the camp of the "hostiles," accompanied by forty or fifty Lipans, but found that other bands had joined the first one at the winter quarters, and that they would have many times their own number to contend with. An attack was made at dawn, Castro, the Lipan chief, being commissioned, with a portion of his warriors, to run off the Comanches' horses, while Moore and the remainder of the party charged upon the camp. The surprise was complete, and if the attacking force had been a little larger it would have achieved a signal victory. After the first flurry the Comanches rallied and drove the whites from the camp, but they took a position in a ravine and continued the fight through the day. Castro and his assistant "horse thieves" proved too greedy to accomplish the work given them, for they attempted to get away with the whole drove of several thousand head, and were consequently so delayed that the Comanches came up with them and recovered the greater part of their property. Consequently, Colonel Moore returned with his purpose only partially accomplished, but he had taught the Indians a lesson which they were slow to forget.

Almost coincidental with the fight above mentioned, another party of Indians attacked a settlement on the Colorado, killing a Mrs. Coleman and her son, a lad of fifteen years. The story of this tragedy is of interest, since it shows the manner in which even the children of the pioneers could conduct themselves in the face of dangers calculated to appall the bravest of men. The Coleman family, with a neighbor named Rogers, were a short distance from the house when the attack was made, and Coleman and Rogers escaped to a thicket in the Colorado bottoms. Mrs. Coleman and her four children ran toward the house, but the youngest boy, Tommie, who was only five years old, was easily overtaken and captured. Mrs. Coleman reaching the door, turned to assure herself that all were saved, but was pierced through the throat with an arrow and soon expired. With her last breath she directed her son to get the guns and defend his sisters, and he discharged his duty nobly. The simple words in which Wilbarger relates the continuance of the struggle are as follows: "Young Albert fought with heroic bravery for a while, killing and wounding some three or four of the enemy; but finally he received a wound which in a very short time proved fatal, and he breathed his last with his head pillowed in the lap of his oldest sister, the last words he uttered being: 'Sister, I can't do any more for you. Farewell.' This left his two little sisters to take care of themselves as best they could. The little girls, who had taken refuge under the bed, kept up a conversation with each other, as they had been told to do, which doubtless deterred the Indians from entering the house, thereby saving their lives and the house from being plundered." Regarding the tragedy from the practical standpoint of one who was reared in the midst of such incidents, Wilbarger sees nothing worthy of especial comment in this instance of boyish heroism, nor in the spectacle of two timid girls cowering by the murdered bodies of their mother and brother, and forcing themselves to carry on an apparently unconcerned conversation that the Indians without might be deceived into thinking that the cabin still possessed defenders. By

noon of that day fifty-two men had collected and were in pursuit of the murderers, and twenty-two hours later they overhauled them on Brushy Creek, in Williamson County, and in the first fight which followed, Captain Burleson, one of the leaders of the Texans, was killed and the entire party retreated. Later they were re-enforced by General Ed. Burleson and thirty-two men, and returned to the attack. They found the Indians occupying a strong position on a ridge, but dividing their force, took stands on either side where their rifles could do effective work. Several ineffectual attempts were made to dislodge the Indians, but the Texans suffered so severely in these efforts that they abandoned them at length and contented themselves with keeping the enemy under a constant and deadly fire. Following their usual custom, the Indians withdrew under the cover of darkness, their mournful wailing as they left the field telling that their losses were heavy and probably included some of their most noted warriors. The whites lost four men killed in both engagements.

In their different engagements with the Comanches the Texans had taken many prisoners, while the Indians were known to have a number of white women and children in captivity. An exchange of prisoners was proposed and agreed to, and was arranged to take place at San Antonio in March, 1840. The transfer was to include all the prisoners held by either side, but when, on the 19th of March, the parties met as agreed, only one captive was produced by the Comanches, a Miss Matilda Lockhart, who had been captured in DeWitt County in 1838. Sixty-five Comanches, including twelve of the leading chiefs of the tribe and a number of women and children, met the peace commissioners at San Antonio, and when they were asked to produce their other prisoners, the head chief, Mukwarrah, persisted that they had but one, Miss Lockhart, and that the others were held by different tribes over which the Comanches had no control. Miss Lockhart denounced this as a falsehood, for she had seen several other prisoners in their camp a few days before, and knew that they intended holding them for ransom. A company of soldiers, under the command of Captain Howard, were ordered into the council room, and the interpreter was told to inform the chiefs that they would be held as hostages until the other captives were brought in. A fight immediately followed, in which the twelve chiefs were killed, but not before they had wounded Captain Howard and killed Judge Hood and several others.

Meanwhile the Indians on the outside of the building had taken the alarm, and attacked the guard with savage energy, even the squaws taking an active part in the encounter. Lieutenant Dunnington was shot through with an arrow, by a squaw, and instantly killed. Judge Thompson was shot and killed before he had received a warning of his danger. Some of the Indians took shelter in a stone house where they defended themselves for a time, but were all killed by the steady fire of the soldiers, the last one being forced to leave the building by throwing a burning turpentine ball down upon him from the roof. Others escaped across San Antonio River, but were pursued and all slain, except a renegade Mexican who managed to give the excited soldiers the slip. Altogether, thirty-two warriors were slain, together with three squaws and two children, while twenty-seven women and children were made prisoners. Later, one of the squaws was sent to apprise the tribe that the exchange would still be made if all the white captives were brought in as agreed, and several days afterward this arrangement was satisfactorily carried out. But the Comanches never forgot or forgave what they were pleased to term the white man's treachery, and they were not slow to strike a decisive blow for revenge.

In the summer of 1840, the warriors of the Comanche tribe prepared for a general invasion of the southernmost settlements west of the Colorado River. Early in August, a force variously estimated at from five hundred to one thousand braves, swept down from the Western prairies, and encompassed the town of Victoria, killing several of its citizens before they could recover from the confusion and consternation caused by the sudden and unexpected attack. The survivors fortified themselves in some of the stronger dwellings, and forced the Indians to withdraw, but they swept the country clear of horses and ...e, driving away with them several thousand head. Encouraged by their easy victory, the Comanches determined to attack the little seaport town of Linnville, situated some fifty miles south of Victoria, and approached this place in the dusk of early morning, concealing themselves by riding on their horses' sides, and in this way causing such of the inhabitants, who took note of their approach, to believe that it was simply a herd of ponies, being brought in from Mexico by some adventurous trader, seeking a market. The Comanches were in the heart of the town before their true character became known to its people. Many of the Texans were killed as they rushed from their homes in a frantic

attempt to escape, others were cut down on the beach, where the boats, their only refuge, were anchored in the shallow water. The Comanches followed the fugitives, even after they had gained the boats, as far as they dared venture on their mustangs, and the ripples on the surface of the bay were crimsoned with the blood of many innocent victims. History fails to give an estimate of the number who fell in this terrible massacre, but it must have been considerable, for no attempt at resistance was made, and the entire horde of red murderers were busied in the work of death. Several women and children were captured, and, after the remainder of the inhabitants had made their escape, the town was pillaged and fired.

Linnville had been a supply point for the settlements farther north and possessed several stores well provided with merchandise, therefore the quantity and character of the plunder taken by the Comanches can be imagined. Several hundred horses and mules were packed with the valuables secured, and gathering all the loose horses the Indians added them to the herd secured at Victoria, decking many of them with stolen ribbons and strips of bright colored cloth. The warriors were frantic with delight, and as they turned their immense drove of captured horses northwestward, their wild yells were wafted to the little flotilla of boats far out on the water, which held all that remained of Linnville's once happy and prosperous people. The flames and smoke of the burning town seemed to have an irresistible attraction to many of the braves, and they lingered around on the beach until the main body of the Comanches were far advanced on their return. News of the massacre was rapidly spread throughout the country, and while the Indians were hurrying to reach safety in the wilderness, couriers were speeding in every direction, and the Texans were assembling to a common center in companies. Luckily the trail made by the Indians in their descent had been discovered, and the alarm had spread before tidings of the Linnville disaster had reached the other settlements. An attempt to check the Indians in their retreat was made by Ben E. McCulloch with a small force gathered from the Guadalupe, Gonzales and Lavaca settlements, but in the face of such overwhelming numbers the Texans were forced to draw back and await re-enforcements. McCulloch was not idle, however, but by a forced march he again got far in the advance of the savages and stationed himself at Plum Creek, where he was joined by the companies of Captains Matthews, Ward and Bird. Captain Matthew Caldwell (familiarly known as "Old Paint") was present among others, and when on the morning of the twelfth of August his spies announced the approach of the Indians, he collected the little band of less than ninety men, all told, and in a short and inspirited speech counseled an attack. The words used by "Old Paint" on this occasion have been preserved, and though not remarkable for polished eloquence, still impress the reader with the commendable spirit that prompted their utterance. "Boys," he said, "the Indians number about one thousand. They have our women and children captives. We are only eighty-seven strong, but I believe we can whip hell out of them. What shall we do, boys? Shall we fight?" It is needless to state that an affirmative response was heartily given, and preparations for battle were hastily made. As Felix Houston, General of the Militia, was present, he assumed the command; but at this juncture Colonel Bureson came up with one hundred Texans and thirteen Tonkawa Indians, and swung into line to await the plunder-laden army of Comanches, which was now approaching and in full sight. A battle was inevitable, for the Indians could not afford to turn in a new direction with such an enemy to harass them in the rear; and, besides, they were flushed and confident from their past successes, and were in no respects averse to a general engagement. All they wished to gain was a sufficient delay to allow them to crowd their stolen horses on out of harm's way, and in the first part of the conflict this was given them in a measure, through General Houston's ignorance of Indian warfare and its methods. For a time the Texans stood and received the charges of the Indians and a continual arrow flight, replying with their rifles as occasion offered. Then, at Ben McCulloch's suggestion, General Houston ordered his little band of two hundred men to charge, and they rushed forward under their respective leaders, Placido, the Tonkawa chief, well in front with his trusty warriors, cleaving a pathway wherever their weapons gleamed. The warwhoops of the Comanches were echoed back in kind by those valued allies, while the fierce yells of the avenging Texans spoke of a determination to gain repayment for the blood that had flown at Linnville and Victoria. Before this determined rush the Comanches scattered like a partridge brood before the swoop of the prairie hawk. Their retreat became a disorganized rout, and they fled in every direction,

abandoning many of their pack animals and loose horses to the victors. The pursuit continued for ten or fifteen miles, but the Indians had no thought of making a second stand, and the Texans and their Tonkawa friends returned to the scene of the principal engagement, the former to collect the abandoned horses and other plunder left by the enemy, while the latter busied themselves in scalping the fallen Comanches and cutting off their hands and feet to be carried home as trophies. General Houston estimated that from fifty to eighty of the enemy had fallen since their retreat from Linnville had commenced, while in the engagement just described only a few of the Texans were wounded and none killed. Three of the captives held by the Comanches were transfixed with arrows when the retreat became general. The dead bodies of a Mrs. Crosby and a negro were found lying on the field, and a Mrs. Watts was shot in the breast with an arrow, but eventually recovered. She had been captured at Linnville, her young husband having been killed as he was conveying her through the shallow water to a boat.

About a month after the Plum Creek fight Colonel Moore was ordered to raise a volunteer force and follow the Indians who had taken part in that engagement and the preceding raid, to the coast. It was the commencement of October before he had succeeded in arranging everything for a start, and when he marched forth into the wilds his available force comprised ninety Texans and twelve Lipan Indians; the latter being taken along principally to serve as trailers and guides. Eighteen days after his departure, Colonel Moore's spies discovered an Indian camp of sixty lodges, supposed to contain about one hundred and twenty warriors, on the headwaters of the Colorado. The attack was made the following morning at daybreak, and the Comanches were driven from their village to the river. Hemmed in a semi-circular bend, with no chance of escape save by swimming, they were shot down by the Texans without mercy, men, women and children meeting the same fate. The Comanches had decided for a war of extermination and had forced the Texans to adopt their own policy, and now they were reaping the harvest they had sown. A portion of the band succeeded in crossing the stream, but were intercepted by Lieutenant Owen and a portion of the command and cut down, almost to a man. The fight was over in a half hour, and the Victoria and Linnville massacres were well avenged. One hundred and twenty-eight Comanches were lying dead in the bed of the Colorado or along its shores, and thirty-four prisoners were huddled together at the mercy of their captors. It was comparatively a bloodless victory so far as the Texans were concerned, for only two of their number had received wounds and neither were dangerously wounded. The scene of this battle has never been accurately located, but it was not far from the present town of Ballinger, in Runnels County.

The month of November, 1840, witnessed the massacre of a party of forty surveyors who, under the leadership of a land locator, named Sparks, was inspecting the country along the upper Brazos and Red Rivers. They were surrounded while sleeping in camp, and all but two of their number were instantly killed. Wires and Kellogg, the survivors, managed to evade capture, and separately reached the settlements in safety. In December of the same year a party of Texans, led by Major Howard, met a band of Comanches on Opossum Creek in Williamson County, and by alluring them into an ambuscade killed seven of their number without risk to themselves. This was, however, the last engagement of consequence that occurred between the Texans and their dangerous neighbors for several years. The savages had wearied of courting disaster by meeting the border riflemen in open battle, and even the powerful Comanches did not disdain to adopt the tactics formerly pursued by the Wacos and Caranchuas, skulking in small bands around the outskirts of the settlements and making isolated and poorly defended cabins the object of their attack. This method of procedure was to the pioneers the most annoying of any that they could have adopted. The presence of a half dozen Indians in a certain locality could rarely be detected until made known by some theft or act of bloodshed, while to maintain organized bands of home guards in every neighborhood was a matter of impossibility. In the vicinity of Austin—then a town of few inhabitants though it had been selected in 1839 as the future capital of the Republic—parties of Indians seemed to linger as though determined that the idea of a permanent settlement there should be abandoned, and in the years of 1841, '42 and '43 murders were committed within two or three miles of the spot whereon the State capitol now stands. There was no opportunity for reprisal, for in most instances the parties killed were waylaid and shot from the roadside, or pierced with bullets or arrows fired through the crevices between the logs of which their cabins were constructed. The same

state of affairs obtained in the settlements along the Red River in the Northern counties of the State, but principally in Grayson and Fannin, the authors of the atrocities in this region being the Shawnees, Cachattas, and other Indians who were generally supposed to be friendly to the whites. Occasionally a roving band would make a descent upon the Brazos and Little Rivers, but principally confined themselves to horse stealing; and it was while upon an incursion of this description that the noted chief, Big Foot, was killed in a fight with Captain S. P. Ross, as related in the biography of T. M. Carter in the biographical portion of this work.

An attempt was made in the spring of 1843 to persuade all the wild tribes of the frontier to enter into a treaty of peace, and Colonel J. C. Eldridge and Thomas Torrey were appointed commissioners to visit them, and arrange preliminaries. It was intended to have the chiefs of all the tribes meet with the representatives of the Republic of Texas at Bird's Fort, on the Trinity, in the following August, when it was believed they could be led into the desired arrangement. The three principal chiefs of the Delawares accompanied the peace ambassadors to act as interpreters and general assistants, as did also a Waco chief named Acequosh. Two Comanche children, who had been captured by the Texans about the time of the Linnville massacre, were taken along as a sort of peace offering to that yet powerful tribe, and it was generally hoped that the object of the expedition would be easily accomplished. Several of the less important tribes were visited, and their consent to the proposed meeting gained; but upon reaching the principal village of the Comanches, the council held to decide upon their proposition was unanimously in favor of putting the white men to death, and it required the utmost efforts of their Indian friends, and the favorable interference of the head chief as well, to carry them safely through their dangerous mission. Very little good was accomplished through this effort to secure a general peace, for, as has ever been the case, the Indians were lavish in their promises while they had not the slightest intention of carrying them out. Some of the minor tribes became less bold in their depredations because they recognized the suicidal results of any other policy, but the knives of the Comanches were never sheathed. Even had the principal chiefs of the tribe favored peace with the Texans, they could hardly have restrained wandering bands of their hunters from attacking the outlying settlements, or killing and scalping such defenseless whites as might be unfortunate enough to fall in their hands. Even while Colonel Eldridge was prosecuting his fruitless mission among the wild tribes, two important battles with the Comanches were fought in the Pan Handle country. Colonel Snively and a strong party of Texans had penetrated to the Northwestern boundary of the Republic, in hopes of capturing a train of valuable merchandise bound from Independence, Mo., to Santa Fe, but this attempt upon the supplies of their New Mexican neighbors, was frustrated by Captain Cooke, of the United States army, in command of the detachment which had escorted the train through the Kansas wilds. Crossing into Texan Territory, he captured and partially disarmed Colonel Snively's force, and delayed it in various ways until the arrival of a Mexican escort from Santa Fe, strong enough to render further attempts by the Texans futile. On his return to the settlements, Colonel Snively was twice attacked by the Comanches, on Owl and Antelope Creeks, but in both instances the Texans had the best of the fight, and kept their assailants at bay until an opportunity was given them to withdraw from the field.

In the spring of 1843 a party of twenty Caddos from the upper Brazos departed from the usual policy of their tribe and took the war-path against the whites. Their first victims were three men, Henry, Castleberry and Courtney, whom they surprised on Salado Creek, killed, scalped and stripped, and then mangled their bodies in a horrible manner. Proceeding to the Colorado River, twelve miles below Austin, they had collected a number of horses and had started on their return when they were discovered and pursued by a party of five Texans, who were armed only with mesquite clubs. As the Caddos had neither saddles or bridles and were driving the stolen horses on foot, they were soon overtaken, and on a smooth slope free from bushes where they had no opportunity to hide. In spite of their advantage in point of numbers and arms, the Indians did not dare to risk a hand-to-hand fight, and finding that they could not check the Texans with arrows, they suddenly dropped to their knees and commenced "fiddling" on their taut bow strings with their arrows, making a peculiar caterwauling sound that frightened the horses of their pursuers and caused them to turn and bolt in the opposite direction. Following this plan whenever close pressed, the Caddos finally reached shelter and escaped, though followed some twenty miles by an armed party which arrived too late to take part in the novel

encounter just described. One of the Texans received an arrow wound, but the injury inflicted was slight. Later, in the same year, the Lipans made a descent upon the settlements surrounding Austin, killing a couple of the citizens, and during 1844 and '45 an occasional outrage was committed as far east as the counties along the Brazos.

While the Mexican war was in progress the Indians of Western Texas were unusually quiet, probably awed into temporary peace by the spectacle of the immense armies which crossed Texan territory en route to the seat of war along the Rio Grande. Besides, McCulloch's company and others were kept continually on the frontier, and the savages were sharp enough to note the preparations made for their benefit and to conduct themselves accordingly. The ever restless Comanches were not altogether idle, but their attention was principally directed to the Mexican settlements lying west of the border, and which, through the centralization of Mexican troops for the defense of the capital city, was left wholly at their mercy. The annexation of Texas to the United States in 1846 was a hard blow to the Indians, for it arrayed against them the full power of the American Government. Years before, a captive chief had tauntingly said: "The Texan's hand is heavy, but his arm is short. His squaw is crying in the lodge of the Comanche, but he cannot reach her." Now all this had changed. The prairie tribes had felt the power of the "blue-coat braves;" they knew that their numbers were great, and on more than one occasion the mountains and prairies had rang with the thunder of their big guns. Heretofore the Indians could prey upon the Texan settlements and retreat for safety to American territory, but they feared that this convenient state of affairs had come to a termination. Possibly the Texans were of the same opinion, but the experience of nearly thirty subsequent years proved it a sadly mistaken one. A judicious distribution of troops along the Texan frontier at the termination of the Mexican war would have practically settled the Indian troubles. It was not made, and once more the entire border swam in blood, and was illuminated by the flames of burning homes. Gradually, as if feeling their way, the Comanches resumed their old-time raids after horse flesh and possible scalps, being most troublesome in Hays and Gonzales Counties, where they could reach the settlements unobserved by taking advantage of the broken ground along the Guadalupe River. The following incident, given in Wilbarger's work on the Indian troubles, is worthy of republication, since it shows how watchful the Texans were compelled to be in the protection of their homes and property, and to what an extent they were frequently indebted to the good offices of their allies, the friendly Indians.

"The traveler who passes San Marcos will see, north of the road, perched on the high bluff which overlooks the San Marcos head spring, a rude log house, built by General Burleson when he was, at that place, the outside settler. Hither came, from time to time, Placido, the Tonkawa chief, and his son, who were the friends of Burleson. Placido was a lithe, active Indian, every inch a warrior, who boasted that he had never shed the blood of a white man. When Placido made with his squaws his annual visit, General Burleson, who valued his services to Austin's early settlers, always made him presents of ammunition, and sometimes of ponies. During one of his visits, in 1848, Placido and his son were sitting down in Burleson's family room at his San Marcos spring house, conversing with General Burleson and his son Ed, who was about the age of the younger Indian. About nine o'clock at night what seemed to be the hooting of an owl was heard. Placido, whose quick ear discovered the cheat, rose instantly and covered up the blazing fire with ashes, at the same time whispering the word 'Comanche.' As soon as all had been made dark, he crawled upon the floor to the door and disappeared in the darkness. Quickly returning, he whispered to Burleson: 'Scurry stole; Comanche steal 'em.' Scurry was the name of a splendid horse presented to General Burleson by his friend, General Dick Scurry, a horse ridden by Scurry at the battle of Monterey. Fortunately, in a small stockade adjoining the house were the horses of Placido and two other horses belonging to the General. Though it was quite dark, these were quickly saddled, and the Burlesons, with young Placido, followed the old chief noiselessly around the mountain. Those who have been on that mountain will remember the level space near its summit, which belted it for more than a mile, varying from twenty to sixty feet wide, on which no bushes grew, while on each side was the dense cedar brake, through which no horseman could ride at night. Placido led the way in this open space, for he knew every foot of the mountain and the openings which led to the head of the Blanco, as well as the Comanches. In about

half an hour the moon arose, and Placido quickened the pursuit, sometimes through dense brush, where the rider could not see an arm's length before him, and then suddenly emerging in an open glade. The pursuit was continued without a word being spoken until after daybreak. The Comanches, never dreaming that pursuers were on their trail, had gone leisurely along until just before sun-up, when, as they were crossing an open prairie, they discovered the pursuers close behind them. Then began the race for life. There were three Indians; one rode Scurry and the others were mounted on ponies. Burleson's heavy weight, for he had then become corpulent, gave Placido and the two boys an advantage in the race, and he fell behind. The rider of Scurry could have escaped, but he remained in the chase close by his companions, though in the lead. As Placido and the two young men approached near the Comanches, General Burleson shouted: 'Big beef for Scurry, Placido; big beef for Scurry.' Placido was slightly wounded by an arrow from one of the rear Indians, both of whom were quickly slain, but the rider of Scurry stood at bay, and was killed by a lance thrust by the Tonkawa chief, when the horse was taken back unhurt. The combatants were few, but seldom was ever a race ridden on Texas soil with more desperate resolve or more tragic end."

Young Ed. Burleson, who took an active part in the fight just described, received his first lesson in warfare as a mere boy on the field of Monterey. He had inherited his father's military spirit, and we find him in 1850, as a lieutenant in command of a ranger detachment, leading his men into an engagement with a force outnumbering them two to one and winning a signal victory. The fight occurred on the San Antonio and Laredo road, not far from the Nueces River. Three Indians were sighted, riding leisurely along about a mile from the road, and Burleson instructed his men to continue on their course, while, with nine volunteers, he galloped forth to kill or capture the savage trio who, as their backs were to him, seemed unaware of his approach. At last, when the two parties were separated by not more than fifty yards, the three Indians turned and revealed thirteen more on foot who had before been concealed from view by the horses. The rangers halted at this unexpected sight and looked to their lieutenant for orders, and Burleson took the initiatory by dismounting and opening fire. The Indians were armed with bows and lances and the rangers with carbines and revolvers, but as the savages charged up to within a few paces, firearms were but little more effective than arrows. Nearly all the rangers were wounded, Burleson being struck with an arrow which glanced from his skull but pinned his hat fast to his head. Baker Barton received three wounds, either of which would have proved fatal, and died standing erect, grasping the horn on his saddle. Several of the men received as many as four wounds each; but the Indians were suffering severely from the steady fire of the revolvers, a weapon then newly introduced, but with the use of which the rangers had already become quite well acquainted. Burleson had killed the chief in the outset of the encounter, and three other Indians had been slain while the majority of those remaining were wounded. Presently Burleson's interpreter gave the glad intelligence that the enemy were discussing the necessity of retreat, and a moment later they withdrew from the ground, the rangers being too badly cut up to think of pursuing them. The historian of this battle, after describing the death of the gallant Barton, continues: "William Lackey was wounded in three places. Jim Carr received four wounds. A warrior charged him, lance in hand, and was killed by Carr with a shot from his carbine. In an instant his carbine was again up and leveled at another Indian, who sent an arrow through his hand, penetrating the last joint of his trigger finger and the breech of his gun; the wood splintered and released his hand. Jack Spencer, though wounded, was charged by three Indians at the same time. He used his horse as cover, but received help from a comrade just in time. Alf, Tom and Jim Wilkerson, though desperately wounded, fought until the Indians retreated. During the fight, Leach and a wounded Indian were both prostrate on the ground, and but a few feet apart. Burleson's quick eye discovered the wounded Indian with a pistol in hand pointed at Leach, and turned his pistol to dispatch the Indian when Leach said: 'Save your fire, lieutenant. I've been watching him; he's only bluffing; there's no load in that pistol.'" Such was the material of which the early Texans were made; such the men who fought the savages on their own ground and never faltered in the face of overwhelming numbers. William Lackey, mentioned above, died from his wounds before the settlements were reached, but the others arrived at Fort McIntosh in ambulances sent out for their conveyance, and recovered to do further service against the Indians.

It would be ridiculous to claim that all the Texans were formed in heroic mould, for they were only human after all, and possessed their due share of human faults and weaknesses. Still, cowardice was so uncommon as to be thought worthy of especial mention. In the memoirs of "Big Foot" Wallace, one of the most noted Indian fighters of the Southwest, and who is still living, having survived the border wars of a half century, there appears the following anecdote and comments which have a direct bearing on the matter in question. While in charge of the mail coach running between San Antonio and El Paso, Wallace and his escort had a spirited encounter with a band of Comanches who surrounded the camp at night and were repulsed after a hard fight. Wallace says: "When the Indians were charging us so fiercely, I saw one of my men skulking behind a clump of prickly pears. I went to him and told him to come out and fight like a man. 'Cap,' said he, 'I would if I could, but I can't stand it.' I saw by the way that his hands shook and his lips quivered that he was speaking the truth. I replied, 'Well, stay there then if you must, and I will say nothing about it;' but some of the rest noticed him, and if I had not interposed they would have killed him, and I might just as well let them, for the poor fellow had no peace in his life afterward. I have seen two or three men in the course of my life who were naturally scary, and could not help it any more than they could help having bandy legs or a snub nose. They are born so and are more to be pitied than blamed. You might as well blame a man for not being as smart as Henry Clay as to blame him for not being as brave as Julius Cæsar; all the same, it is very aggravating to have them act in that way when the service of every one is needed as it was on this occasion. But after all, bravery is about as safe from harm as cowardice. This man was the only one wounded, with the exception of Fry. An arrow flew where he was hiding, struck him in the arm and pinned him to the prickly pear behind which he was concealed."

Several Indian fights of importance occurred during the year 1850, for the frontier was well patrolled by armed forces of Texans who made it a point to attack every band encountered unless the Indians gave good and sufficient proof of their friendliness. In consequence the sight of a plumed scalplock was generally a sure precursor of a "skrimmage." The Texans, as an old-timer once explained to the writer, had decided that the quickest way to deal with their red enemies was the best way, and it was easier to "pull down on every thing that came along," than to waste time asking an Indian if he wanted to fight. As early as 1847, a line of posts had been established along the northern border of the settlements, which quite effectually prevented the danger of an Indian descent catching the settlers unawares. Captain Shapley P. Ross' company was stationed on the Brazos near the present site of Waco; McCulloch's, on the Colorado, seventy miles above Austin; and Highsmith's company near Fredericksburg, while "Big Foot" Wallace, with a command of twenty rangers, was thoroughly patrolling the country along the Nueces River, and between that stream and the Rio Grande. Scouts from each of these commands met at intermediate points each week, thus keeping up a constant line of communication, while scouting parties were continually on the move, watching for Indians or any signs which would indicate the passage of war parties through the territory guarded. It was a practical adaptation to the military needs of the day of the plan known as "line riding," afterward adopted by the cattlemen of the Southwest; but, in this instance, instead of herding cattle within prescribed limits, the frontier line riders were herding the Indians out. Though this system of defense was abandoned all too soon, it proved during its continuance the best protection the settlers had ever known; and when ordered into the field in 1850 to protect the settlements between the Nueces and San Antonio Rivers, Captain McCulloch adopted a similar plan though on a smaller scale. Establishing his camp on the head of the Aransas River, he kept his scouts continually covering the field between the Nueces and San Antonio, and was soon able to call a halt on the continual depredations previously committed. A party of fifteen Indians succeeded in passing the line, but were followed by Lieutenant King and a detachment, and, after an all day's chase in a driving rain, overhauled and forced to make a stand in a deep ravine, from which the Texans could not dislodge them. McCulloch was on the ground next morning, at daybreak, with a reinforcement of twenty men, but the Indians had decamped, and were never overtaken. Later on McCulloch moved his camp to the North Fork of the Llano, and when on his first scout, with a force of twenty-two men, struck a trail which led him to a Comanche camp on a branch of the San Saba. The Indian band, which consisted of forty braves and two squaws, scattered

at the first charge, and only four of their number were killed. The squaws were captured, as was also all the camp equipage and horses, only one of the whites having been injured in the affair, and he by an arrow fired by one of the squaws before she could be disarmed. The squaws were afterward given a horse each and released, McCulloch telling them that all the captured goods and horses would be returned to the band if they would report at Fort Martin Scott, near Fredericksburg, within a month, and make a treaty of peace. This proposition was afterward accepted by the Comanches, and the commandant at Fort Martin Scott scrupulously carried out McCulloch's promises. This affair, with a severe handling received by a party of Comanches from Wallace's men on the Nueces, went a long way toward quieting matters temporarily, and for several years the settlers on the Southwestern frontier were accorded the blessings of comparative peace.

Now that Texas had become annexed to the United States and the conquest of Mexico had freed the State from all danger of foreign invasion, a heavy influx of immigration followed, nearly all the Northern and Eastern States adding their quota, while colonists from different European countries began establishing themselves in the counties adjacent to the coast. Gradually the settlements began to extend further northward along the upper course of the rivers, while those originally established along the Red River, in Grayson and Fannin Counties, spread southward until they met and mingled with those in the region then known as the "Three Forks" of the Trinity. The first cabin, in what is now Dallas County, had been erected in 1841, and the organization of the county followed five years later, though at that time it contained but a handful of inhabitants. At about the same time a few families settled along the Clear Fork, in Tarrant County, and in 1849 a military post was established at Fort Worth, its position then being on the extreme Western frontier. Protected by this and other outposts, the country to the eastward rapidly filled with settlers, and for a time the entire State seemed to have entered upon an era of peace as well as prosperity. For the first time in the history of the country its inhabitants could pursue their daily avocations without a constant fear of lurking danger. Farms were opened and cultivated, yielding abundant returns. Wagon trains loaded with cotton bales moved slowly along the rough trails leading to shipping points on Red River or Buffalo Bayou, and, returning, brought to the settlers supplies of every imaginable description. The cattle industry, then in its infancy, was beginning to receive notice as a pursuit that might in time be made profitable, and instead of huddling their cabins close together for protection's sake, the pioneers of the Northwestern prairies had begun to appreciate the value of "elbow room," locating with an eye to the best grass and water, and objecting strongly to the presence of a neighbor in their immediate "range."

But while in some respects this policy of isolated ranches had its advantages, it offered to the Indians tempting opportunities that were not to be refused. The buffalo were being driven from the country by the advent of the whites, and so, in lieu of his accustomed food, the Indian contented himself with the choicest cuts from the best animal of some settler's herd, at the same time providing for his friends, the wolves, by transfixing with his arrows a half dozen more cows or steers in a spirit of mere deviltry. If the ranchman's horses wandered from the immediate vicinity of his cabin, they vanished as suddenly as if a cyclone had swept them from the earth. Sometimes a settler and his family would be killed and scalped, but for a period of years such occurrences were infrequent. Though unable to entirely curb their thievish nature, the Indians were not courting trouble, and had learned how far they could go with impunity. By perusal of the biographical portion of this work, it will be found that many references are made to the friendly spirit shown by nearly all the prairie tribes during the early '50s. It was a period of peace, and while this state of affairs continued to exist the settlers obtained a foothold in what is popularly termed the "Upper Cross Timbers," and their log cabins began to dot the slopes of the Palo Pinto and Jack County hills.

But the knives and tomahawks of the Comanches were not long permitted to rust in idleness, and this golden era of fancied security for the settlers was brought to an abrupt termination. In the renewed outbreak of hostilities, the farmers and ranchmen who had established themselves along the Brazos, in Bosque County, were the first sufferers, for their location was so remote from any military post that the Indians could strike there with assurance of ample time to distance effective pursuit. It is possible that the first blood was shed by some prowling band without premeditation, but the sight of freshly taken scalps was all that was needed to break the unaccustomed restraint upon their savage nature, and other murders followed in rapid order.

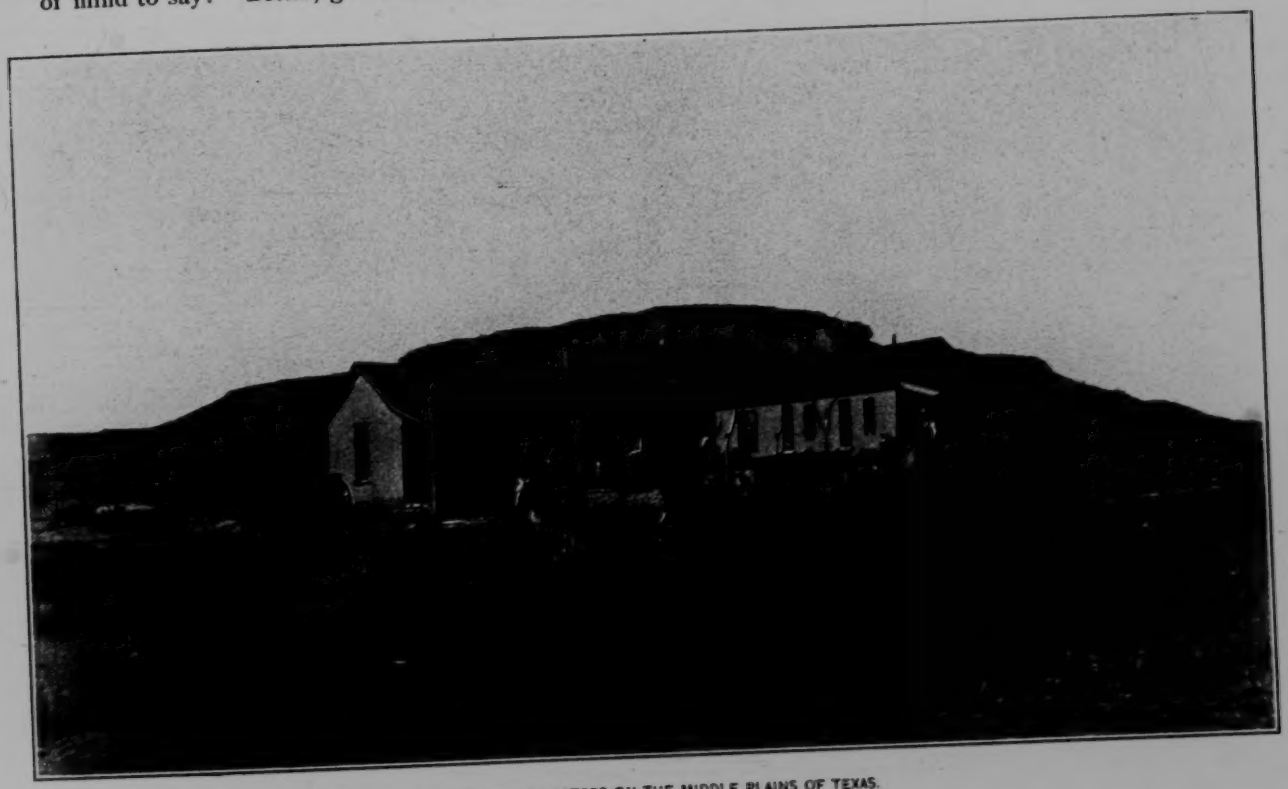
In the winter of 1856-57 a Mr. Renfrew and his son were horse hunting on the head of Meridian Creek, when they were attacked and both killed. The young man was shot dead at the first fire and scalped, but the father rode several miles after receiving a fatal wound, at length falling dead from his horse, which ran riderless home, its blood-stained sides telling to the agonized family the story of the loss sustained. A party searched long and earnestly for the missing men, and some two weeks later the body of the younger man was found, but the remains of the father were not discovered until after the lapse of two years. A few days later a Mr. Bean and a negro servant, returning from some of the larger settlements with a load of corn, were killed after a long fight, in which the Indians were supposed to have suffered considerable loss. The murdered men had evidently used the wagon as a defense, as its bed was pierced in many places with bullets and arrows. The following day the same party of Indians, who had evidently decided that the safest plan was to waylay the Texans at a distance from their homes, murdered a Mr. Johnson, who was returning to the settlement with a load of flour and meal, and carried his eight-year-old boy away a prisoner. They afterward stripped the child of all his clothing, and, while camped fully forty miles from the nearest house, he managed to slip away from them in this nude condition, and wandered around, half dead with cold and starvation, until discovered by some men who were trailing a party of Indian cattle thieves. The boy had found some milk cows that had escaped from their savage captors, and was following them as closely as possible, thinking that they would protect him from the wolves, and possibly lead him back to the settlements. Other atrocities followed closely on the heels of those just mentioned.

"During the first week in March, 1857," says James T. De Shields, one of the best informed and most conscientious historians of this troublous period in the history of the Texan border, "a large band of marauding Indians came down, and, on approaching the frontier, divided into squads of eight and ten, and simultaneously entered Erath, Brown and Comanche Counties, and began depredating in the most daring and alarming manner. A severe drought the previous year had caused an entire failure in crops, which was followed by a severely cold winter, which had reduced what few cow-ponies the settlers had left so thin in flesh that very few were able to do any kind of service; in fact, most of the citizens were literally afoot. Bread-stuffs had to be bought and freighted on ox wagons from Fannin, Grayson, Collin and Dallas Counties. While in this helpless condition, three squads of Indians began depredations at the same time in different parts of Comanche County. One squad of ten passed down the South Leon Valley in open day, gathering what few horses they could find, and four miles below Old Cora (now extinct), on the 3d day of March, 1857, they came upon Gid Foreman and killed him, taking off every vestige of hair with his scalp. Foreman had red hair, which is a great trophy among Comanche Indians. They stripped Foreman, save his drawers, and mutilated his body in a most horrible manner. After butchering the unfortunate man, and tying his reeking bloody scalp to one of their belts, they proceeded down the valley and crossed the North Leon, and about five o'clock p. m. approached John Baggett's ranch, near the present town of Hazel Dell, driving up into the yard and catching the only horse Baggett had left.

"Now, come, ye sentimental lovers of heaven's noblest gift to man—a wife and mother—and view with me this terrible tragic scene, no *ignis fatuus*, no fiction or imaginary concoction of the brain, but a reality. A lone woman, with nine helpless children, with no chance of escape and no means of protection, not even a gun (Mr. Baggett had that with him), and surrounded by ten steel-hearted, fiendish savages, in whose veins the milk of human sympathy had never flowed, with hideous visages made doubly frightful by being bedaubed all over with war-paint, and uttering fiercely their most diabolical warwhoops, their dark bodies besmeared and their hands still dripping with the life blood of Foreman, whose gory scalp was still dripping the crimson fluid and hanging to a fiendish savage, whose greatest delight was in torturing his most innocent victim, while the excruciating suffering and agonizing cries only served to increase his merriment. Mrs. Baggett succeeded in getting seven of the children into the cabin while the savages were catching the horse. But, alas! Oh, horror of horrors! Two of the children, little Joel, twelve, and little Bettie, ten years old, were under a live oak tree, playing, some sixty yards from the cabin, and were intercepted, caught, and four of the savages proceeded to strip off every vestige of clothing that the children had on, and proceeded slowly, so as to prolong the sufferings of little Joel and to increase and intensify a mother's agony, in torturing the little fellow to death by lancing him with arrows in every conceivable way to produce the most acute and excruciating

suffering; and to make his lifeless form appear the more ghastly and horrible, while his plaintive, piteous shrieks were still audible to a mother's ears, one of the savages, to whose belt was hanging poor Foreman's gory scalp, proceeded before life was extinct in little Joel, to scalp him, and hung the scalp on the opposite side of his belt as an additional trophy to heighten the pleasure of their fiendish war dances.

"But is this all of this frightful tragedy? No. Not content with torturing, scalping and killing little Joel, but if possible to add to a mother's already overflowing cup of sorrow and grief, mentally equal to a Spanish inquisition, those barbaric and unfeeling savages proceeded to lance little Bettie in twenty places, in three places to the hollow, then turning her loose to go bleeding, staggering, and fainting twice before she reached the house. On reaching the house, Mrs. Baggett still had the presence of mind to say: 'Bettie, go around to the other door; the Indians will kill us all if mamma opens this



RANCH HEADQUARTERS ON THE MIDDLE PLAINS OF TEXAS.

door.' Four of the Indians had followed the child to within twenty paces of the door, thinking, no doubt, that Mrs. Baggett would be imprudent enough to come out and meet the child, but she well knew her own life and that of her other seven children depended upon her remaining in the house. So, failing in this, the savages remounted and rode off just before dark, and as soon as they left, Mrs. Baggett carried in the lifeless and mangled body of her boy, and had washed and dressed it before the father's return, one hour after dark. To attempt to describe the feelings of Mrs. Baggett on this occasion would be an utter failure, and a mockery of the sublimest fortitude and courage, known alone to mothers. Indeed, no language, except it be that of angels, is capable of describing such a scene, or a mother's love. Little Bettie got well, grew to womanhood, married, and is now the wife of a wealthy and respected gentleman, living at Abilene, Tex. Mr. and Mrs. Baggett are both dead."

A forcible word painting of a horrible incident. Unfortunately, the murder of Foreman and Joel Baggett were but two among scores of similar occurrences, and the natural ferocity exhibited by the perpetrators of these crimes showed too well that the nature of the red man in his original state of

THE historical chapters of this work have been prepared with great care. The object of the author has been rather to reflect the views of others than to lay down any special theory or doctrine himself. As the views of those quoted are in many cases diametrically opposite and opposed to each other, it is almost superfluous to state that neither the author nor the publishers must be held as endorsing any theory stated, or any argumen advanced.

The absence of authentic records as to the history of the cattle industry of Texas and the Southwest had added materially to the difficulties of preparing the introductory chapters. The author has examined all available literature bearing upon the subject, and, where such a course has been necessary in order to reflect public or local opinion of any given time, authorities have been freely quoted. Some of the works from which quotations are made have long since been out of print, and this is the first time that the views of different authorities have been found tabulated and placed side by side.

As far as possible tiresome tables and long lists of figures have been avoided, though in a work of this character they could not be entirely excluded. Some of the tables given are original, having been compiled especially for this work, and others have been condensed in order to make reference to data of especial importance more convenient.

The author is under obligations to so many prominent cattlemen that it is almost impossible to refer to each one separately. Special thanks, however, are due to Mr. A. P. Bush, Jr., President of the Texas Cattle Raisers' Association; to Mr. A. T. Atwater, one of the earliest members of that Association, but now of the National Stock Yards, East St. Louis; to Messrs. John Nesbitt, Joseph Ramsay, and Christopher Brokate of St. Louis; to the TEXAS LIVE STOCK JOURNAL of Fort Worth, Texas, and the TEXAS STOCKMAN AND FARMER of San Antonio, Texas; to COLMAN'S RURAL WORLD of St. Louis, and to other publications which have kindly placed their files at his disposal.

Among the works of reference which have proved invaluable in completing the chain of records connected with the cattle industry, special mention must be made of the STORIES OF THE SANTA FE TRAIL, published in 1881, and written by Col. Henry Inman; of Joseph G. McCoy's HISTORIC SKETCHES OF THE CATTLE TRADE OF THE WEST AND SOUTHWEST, published in 1874; of Cuthbert Powell's more recent publication entitled TWENTY YEARS OF KANSAS CITY'S LIVE STOCK TRADE AND TRADERS; of TEN YEARS A COWBOY, by C. C. Post, and Tex Bender, the cowboy fiddler; and of COWBOY LIFE IN TEXAS, by W. S. James. In addition to these publications articles in a number of the leading magazines, dealing with various phases of the subject, have been made use of and quoted as occasion called for.

By JAMES COX, Author of "Our Own Country."

HISTORICAL.

CHAPTER I.

The Magnitude of the Cattle Industry.

THE magnitude of the cattle industry of Texas and adjacent territory is far greater than ninety-nine per cent of the people of the United States imagine. Indeed, it is doubtful whether even those actually engaged in the business fully realize its immense proportions and the enormous sum of money locked up and involved in it.

For Texas alone the record is nine million head of cattle!

Since that colossal record was established there has been an inevitable reaction, and at the present time the number of cattle in the Lone Star State is not so large, by twenty-five or perhaps thirty-three per cent; though owing to the improvements effected in the grade of stock and in the system of feeding and fattening, it is not unreasonable to suggest that the aggregate intrinsic value—we do not say selling price—of the cattle of Texas to-day is little, if any, less than when the cattle trade was at the zenith of its prosperity, and when a cattle ranch was looked upon as a gold mine, and a bunch of yearlings as at least as productive as an average silver mine.

When one speaks of nine million head of cattle something very much like what mathematicians call an "unknown quantity" is referred to. Many readers of this book took part in the war, and some of them have, in consequence, an idea of the meaning of figures in regard to assembled multitudes. An army of twenty thousand represents an immense mass of moving or stationary humanity. An army of a hundred thousand is something stupendous, even although when so many troops are called out they are usually scattered around, and the grandeur of the scene is thus reduced. Only those who have seen the colossal armies of the Old World, where so many countries are practically armed camps, can form so much as a conception of what an army half a million strong really means. Very rarely in the world's history have anything like a million men been brought together in a body. In the few instances when this immense aggregate has been approached, the spectacle has been appalling in its magnitude and stupendous in its measurements.

But these figures are cast into insignificance by those in common use in the records of the Texas cattle trade. During the year 1893 at least a million and a half steers left the great Empire of Texas alone for the stock yards at Chicago, St. Louis, Kansas City, Omaha and other points. Averaging twenty-three steers to a car and averaging each car at thirty-three or thirty-four feet in length, we can form some idea of the magnitude of the business and of the length of a train that would have been required to haul the cattle away in a body. In the first place it would have taken more than sixty-five thousand cars to have achieved a task which, while of course it would have been humanly impossible, is interesting and instructive to think of as an argument and illustration. These cars coupled together would have occupied a space vastly in excess of two million feet, which is tantamount to saying that, without allowing anything for locomotives, the front car in the mammoth train that would have been required would have been four hundred miles ahead of the caboose bringing up the rear.

These figures are merely given as an illustration of the magnitude of the business transacted during a year of great depression and almost national panic. A million and a half of steers is another unknown, or not easily grasped, quantity, but almost any one can appreciate the idea of a train four hundred miles long, and stretching across county after county and even State after State.

Adopting the same idea, with a view to showing the magnitude of the cattle industry of Texas during the time when it was at the height of its prosperity, attention may be called to the fact that, even allowing for calves, yearlings and cows, it would have taken more than a quarter of a million of

cars to have hauled those nine million cattle out of Texas at one time, and that these cars would have made up a train eighteen hundred miles in length, or longer than a line drawn from the southern ranches of Texas to the stock yards at Chicago, and many miles beyond them.

Considering these facts, and the gigantic proportions of the trade, it is singular that statistics dealing with it are conspicuously absent. The United States census, dealing as it does in minute detail with almost every subject under the sun, devotes to the cattle interest but two bulletins, neither of which can be regarded as complete or in any way satisfactory. There are on record at the capitals of Texas, Arizona, and New Mexico, statistics dealing with every agricultural feature of the different counties, with reports of immense volume; but, strange to say, there is very little in the way of information to be gleaned at the State or Territorial capitals in regard to the cattle interest, which is, all things considered, by far the greatest of all. The National Bureau of Animal Industry is a department to which one naturally turns for information of an authentic character relating to the number of cattle, and their value, in the great States of the West and Southwest. This bureau, however, while it has hunted from Dan to Beersheba and from the Gulf to the Lakes for microbes and germs, has, as a rule, very carefully kept its hands off from those very matters which would have been of assistance to the cattle interest, and which would have called attention to the magnitude of the trade both in this country and abroad.

Efforts have been made, from time to time, to have this defect remedied, and some four years ago a committee appointed by the Interstate Convention of Cattlemen at Fort Worth prepared a memorial to Congress so pertinent to the question that we reproduce the leading features of it.

FIRST. It was the united opinion of the Convention that the chief cause for depression in the live stock industry is due almost entirely to the indiscriminate way in which shipments are made by producers and dealers of the interior to the four prominent markets of the West, viz.: Chicago, St. Louis, Omaha, and Kansas City.

SECOND. That these four markets are so closely related to each other by the interest of four leading meat packers, who now control the slaughtering business in our Western country, as to make them all practically one and the same.

THIRD. That there are no less than twenty-one States directly interested in shipping live stock to one or more of the markets referred to, and owing to the vast number of producers engaged in the industry, and the widely extended territory over which they are distributed, it is a matter of impossibility for them to avoid glutting the markets from time to time, which affords the Packing and Refrigerator Associations the advantage of buying at prices much below the cost of production.

FOURTH. It had been learned that these four large slaughtering concerns have a private arrangement of their own, through which they can tell very closely the probable number and time that live stock will be marketed by producers and feeders; and that they make a practice of holding large numbers of cattle, sheep, and hogs in the interior for the express purpose and intention of forcing them into market from time to time, and thus creating a glut so as to enable them to control prices; and in addition to this, they own and control an unlimited number of cars of their own, which makes them entirely independent of any scarcity in railroad transportation at any and all times.

FIFTH. National legislation is required so as to secure the informing of the shippers of live stock concerning the daily shipments from all of the twenty-one States referred to, as it is utterly impossible to carry on the live stock industry with any degree of safety, unless there is some uniform system employed by each of the States that will indicate the number of cattle, sheep and hogs that are in transit to the different markets from day to day.

"The Interstate Convention of Cattlemen, which we have the honor to represent," the Committee proceeds to state, "were unanimous in the opinion that a Bureau of Information and Statistics in Live Stock, under the direction and control of the Department of Agriculture, would be the most practical way that this information could be obtained, and the following is a report of the Convention upon that question:

"1. That, in our judgment, it is very essential to have a correct record of the available supply and probable demand of live stock, according to ages and sex, in order to form an intelligent opinion as to the value of the same.

"2. Our live stock industry is so extended that the accumulated shipments from all the producing States and Territories renders it impossible for a shipper to tell what number of live stock are being moved and being prepared for shipment to the prominent markets of our country from day to day; and we believe by a system of telegraphic and mail information, the quantity of live stock shipped and being prepared from each State daily can be easily ascertained, and would be of great assistance to the shipper in avoiding glutted markets.

"We therefore believe the establishing of such State bureaus for information and statistics would be of incalculable benefit to the producers of live stock in the United States, but are doubtful if united action on the part of each State can be had, and unless all unite on a uniform system there would be no practical good result. We therefore recommend that this Convention memorialize Congress to appropriate sufficient money to introduce this improvement, in conducting the live stock business of our country, under the auspices of the Department of Agriculture. We think such an appropriation on the part of our Government is due to the live stock industry, which has been developed in the past twenty years over such a vast extent of territory and upon which nearly one-half the population of the United States depends for support.

"The necessity for some improved method of informing shippers in the interior of the quantity of live stock in, and in transit to, the four prominent stock yards, which in fact now handle and receive the entire product of our Western States, is so very clear that it requires very little argument to prove it. These yards are all limited as to capacity, and if a larger number of stock is shipped to either one than can be accommodated, it is quite plain the stock on hand must be sold at a sacrifice in order to make room for new arrivals. This fact was most forcibly, as well as most seriously, illustrated in Chicago only a short time ago. On the 25th of April, 1890, the stock pens of that market, which are only supposed to hold twenty thousand to twenty-five thousand head, were full, or nearly so, when it was announced that receipts of cattle from different shipping points were 32,667 head, to say nothing of other classes of stock. Immediate action had to be taken, and the result was the entire lot were disposed of to the few meat packers of that market, at such prices as they were willing to pay, and it is estimated that the loss entailed upon the unfortunate owners of the stock so sacrificed was no less than one hundred thousand dollars, from what they were quoted the day before. This is not an uncommon occurrence. The receipts at Chicago were only about four thousand head the following day, and continued very light for several days after, and it is not unlikely that in a very short time we shall witness a repetition of this unfortunate occurrence.

"We beg that your honorable body will give this matter your careful and prompt attention, and as a means of better explaining the system that we have the honor of presenting for your consideration, we have annexed hereto an explanation of the same, together with the outlines of a bill which we believe may assist somewhat in conveying our meaning better, and we would especially call attention to the feature of the bill (Section No. 6) whereby the bureau can be made entirely self-supporting. We believe if the proposed system is adopted and properly carried out, that it will result in reviving our live stock industry, upon which every farmer in the United States depends chiefly for the profit of his labor. We only ask that the Government take charge of the matter, because it is impossible for so many States to unite upon any given plan of action except through national legislation. We have submitted the proposed plan of relief to the Chief Executives of nearly all of the States, and we have pleasure in adding to our memorial the endorsement of no less than thirty of the same, together with several other prominent names."

These endorsements were singularly enthusiastic. Mr. Robert Porter, Superintendent of Census, warmly endorsed the proposition, and Mr. J. M. Rusk, then Secretary of Agriculture, wrote heartily favoring the idea. Endorsing the proposition and the Convention contemplated in connection with it the latter said: "I am persuaded the organization by the cattle growers of the States largely interested in this industry of associations whose special duty it shall be to watch over the interests of their members, and of the industry which they represent, must result in good. The commercial side of cattle growing, as of all branches of agriculture, has not in the past received that attention from the producers which it deserves. In recent years we have begun to realize that in the face of world-wide competition, the result of extraordinary development in transportation facilities, the question of

marketing our products is almost as important as that of producing them. I assure you of my earnest sympathy and of my hearty co-operation in all measures which may be legitimately adopted for the relief of our cattle growers."

Thus generally encouraged, the system suggested was elaborated. It was proposed that there should be a Bureau of Information and Statistics in each State, which should report daily to a central bureau the number of live stock passing out of the State during the preceding twenty-four hours. Special bulletins relating to the principal markets were also to be provided for, and another duty was to be the gathering of statistics concerning all the cattle growers in the country, with the nature of their holdings. A weekly statement to be sent to each producer was projected, and the special features of it were to consist of reports of the shipments of stock to various markets, of stocks left on hand in the interior, of stocks on hand and unsold at different markets, and of stocks in the hands of meat packers, either alive or in the cooling rooms. In short, the scheme was as nearly perfect as could well be imagined, but so far it has not got beyond the stage of endorsement and approval, its friends in Congress not deeming the time opportune for the introduction of the necessary legislation.

In the meantime one is forced to gather data concerning the magnitude of the cattle interests of Texas and the United States from the meager details published, and from the personal views of the most experienced men engaged in the trade.

Naturally one refers first to the Federal census of 1890. That census, as was generally known, was complete, and indeed superabundant, in almost every detail. In the opinion of many, its bulletins are cumbered with details of little or no interest to the general public, or to any one but those who compiled them. So far as the cattle interest is concerned, however, there has been a most commendable policy in the way of brevity adopted, though unfortunately the most important facts have been omitted, either in order to steer clear of the prolixity and profuseness which mark the census reports generally, or, perhaps, because the facts and figures were exceptionally difficult to obtain. General Porter started in with the best possible intentions. In May, 1889, a special telegram from Washington to the New York *Herald* caused considerable interest, not to say hope and expectation, among cattle growers. It read as follows:

"The statistics on cattle raising and pork products in the new census will be as full and exact as Superintendent Porter can make them. He is thoroughly impressed with the importance of the subject and will give it special attention. He has received letters from Dr. Azel Ames, who was here last year looking after the matter, and he has been in consultation with Mr. I. H. Saunders, of Chicago. Mr. Porter has not yet selected a man to superintend this work. It is not unlikely he will take Mr. Saunders, if that gentleman is not in Europe when these statistics have to be taken. Dr. Ames, when he was here last winter, laid special stress upon the importance of these statistics on the ground that the beef supply, per head of population, was becoming less from year to year, and that it might soon become a serious problem whence beef enough could be got to feed our own people, to say nothing of exportation. Exact statistics would help in solving this problem. In 1860, Dr. Ames stated, the number of cattle in the country was eight hundred and fourteen to one thousand population, but in 1885 it had fallen to seven hundred and twenty-two to one thousand, and the drought and famine in Montana, in 1887, made such inroads on the herds that the proportion he estimated was reduced to seven hundred to one thousand population."

We have all heard of the place, the road to which is said to be paved with good intentions, and enthusiastic as General Porter was at the outset, his success cannot be said to have been phenomenal. Mr. William L. Black, Chairman of the Committee charged with the duty of obtaining legislation providing for a Bureau of Information and Statistics, wrote concerning this promise and announcement:

"Mr. Porter will, doubtless, testify to the fact that it has been almost a matter of impossibility to gather correct statistics of live stock, owing to the vast extent of country over which they must be taken, and the limited force that he was permitted to employ in gathering the same."

This enthusiastic worker in the interests of the cattle raisers of Texas and the Southwest is a prophet and a true one at that. General Porter, while he did not use the exact words anticipated by Mr. Black, proved by his bulletins that he was absolutely unable to furnish satisfactory information concerning this very important subject. Only two bulletins, or rather a bulletin and a fraction, deal

with live stock. One of these, Number 17, appeared on October 10, 1891, under the caption, "Live Stock on Ranges." This bulletin, although it contained of course a great deal of valuable information, was much more conspicuous for its omissions than otherwise. Its redeeming feature was a statement that the figures did not include live stock on farms, and that data concerning these would be published in a subsequent bulletin. Month after month followed without this second contribution to live stock history, and it was not until March, 1894, that it finally appeared as part of Number 378. That it was incomplete in many respects was obvious to the experienced cattleman at a glance, and placed together, the two bulletins remind one very much of an appetizer preceding a banquet which is never served.

Oliver Twist is represented in one of Dickens' best works as electrifying the red tape of the British poor law by asking for more; the American live stock raiser, after carefully examining the two bulletins, is apt to be guilty of a similar or even more serious offense. Certainly he cannot help realizing the fact that the census mountain, after causing a great deal of excitement while in labor, finally succeeded in bringing forth two very small and imperfectly developed mice.

Without desiring to be hypercritical, it is difficult to overlook the fact that the bulletins abound in platitudes, and throw in facts very much as a side issue. A well-known politician is quoted as saying, that when the other fellows have the best of the argument on the issue of the day, a greater portion of the speech should be devoted to patriotic references, with casual data as to the greatness of the country and its unparalleled possibilities. The preparers of the census bulletins in question evidently appreciated the soundness of a theory of this kind. Thus the second paragraph in the bulletin dealing with "Live Stock on Ranges" announces, apparently as a startling discovery made by the employes of the Census Department, that "since the census of 1880 great changes have taken place in the industry of range cattle. Large areas once used as ranges are now enclosed as farms, and the cattle are driven to new and distant feeding grounds. A large portion of Texas, Colorado, Oregon and California, one-third of Kansas, and one-half of Nebraska have been converted into farms during the last decade."

This announcement seems to have exhausted the resources of the compiler of the bulletin, who goes on to explain the difficulties encountered in gathering the information. "The data for this bulletin," he says, "were obtained from reports by experienced stockmen and special agents who personally visited the ranges in all the States and Territories. After the special agents had begun their work it was found that in some cases the regular enumerators had made a partial enumeration of range stock. This occurred through the difficulty of exactly determining the border line between range stock, and stock on farms owned by farmers who are constantly extending their farm area. Again, large numbers of stock are, during portions of the year, within farm enclosures, and at other times on the ranges. Owing to this difficulty in exactly defining the lines of range and farm stock, and to avoid duplications, only the stock known to be outside of that taken as farm stock is included in the tables of this bulletin. The figures of all stock upon farms will appear in the reports of live stock on farms when published, and will be in addition to those contained in this bulletin."

This explanation precedes any results, and accounts for the fact that the active and intelligent agents of the bureau only succeeded in discovering in June, 1890, 6,828,182 head of cattle on the ranges of the United States. In view of the fact that taxes are paid in Texas at the present time on nearly as many cattle as this, the lamentable inadequacy of the return need hardly be enlarged upon. The total number of men found employed on ranges in care of stock of all kinds, including cattle, horses, mules, sheep and swine, was 15,390, showing that quite a goodly number of cowboys must have been out hunting or fishing, or, perhaps, engaged in political duties, when the enumerators made their casual rounds or prepared their guesses. The last statement in the introductory page of the range bulletin would be important if true. It reads that "the industry is found to be more generally prosperous at this time than for several years previous." The word "several" is, of course, elastic, but under its ordinary acceptation it makes the sense ridiculous. Any ranchman will make affidavit that the industry in 1890 was not approximately as prosperous as it was seven or eight years previously, when prices ranged more than twice as high and incidental expenses were conspicuously lower.

The bulletin on live stock on farms, instead of coming out as promised in a separate return, is dovetailed in amid a number of statistics on agriculture, including some wearisome and comparatively

insignificant figures dealing with the product of tobacco and rice. From the portion of return of interest to our readers we find that over a million working oxen, more than sixteen million milch cows, and nearly thirty-four million "other cattle" were discovered on farms in the United States, making a total of neat-cattle on both farms and ranges on June 1, 1890, of 57,648,792. Whenever an active political campaign is in progress, the question in some States and Territories is not so much which party will win, but whether the majority will be in the thousands or tens of thousands; so in regard to these figures, it is not so much a question as to whether they are accurate or not, but as to whether they understate the actual totals by five, ten or twenty per cent.

Passing for a moment from the question of the accuracy of the figures, we come to Mr. Mortimer Whitehead's remarks on "Ranges and their Divisions." This special agent of the Census Office calls attention to the fact that for census purposes live stock was divided under two heads, the first of which is live stock on ranges, including "the great herds that roam over the public domain, depending entirely for their subsistence upon the wild grasses and forage plants indigenous to the soil." The range country, it goes on to explain, was divided into nine districts, which were as follows:

1. The State of Texas, except the "Pan Handle."
2. The Indian Territory and the "Pan Handle" of Texas, including the Public Land Strip.
3. Colorado, the western borders of Kansas and Nebraska, and Wyoming.
4. The Dakotas (western portion) and Montana.
5. Idaho and the eastern portions of Oregon and Washington.
6. Nevada and Utah.
7. California.
8. Arizona.
9. New Mexico.

Had the returns been adequate and complete, these divisions would have been very satisfactory, and would have shown the distribution of live stock in a very complete manner. But, as we have already hinted, the returns are more conspicuous for their omissions than their reliability, and this fact is explained, although not admitted, by the statement that soon after the field work commenced difficulties were encountered in determining the exact lines dividing range stock proper and that which should be classed as on farms. In order to avoid duplications, and preferring to understate rather than overstate the facts, the special agents were, as we have seen, promptly instructed not to enumerate any stock which had been covered by the regular enumerators as on farms. The result of this instruction is the startling announcement "that the live stock of Western Kansas and Nebraska, North Dakota, Nevada, and portions of South Dakota, Colorado, and Utah, which some persons might consider as 'range stock,' is not included in the tables of this bulletin." The "some persons" referred to may be likened to the eleven proverbially obstinate jurymen, the census authorities representing the infallible and omnipotent twelfth. We quote the explanation, not so much for the purpose of criticising the department or the census on live stock, as to show why the figures we give as official are so deplorably out of line, inadequate and misleading.

The first district includes the State of Texas with the exception of the Pan Handle country. In this district the enumerators found 1,854,349 head of cattle of every kind, from the baby calf to the eighteen hundred pound steer. It is to be presumed that at least a large proportion of the members of the Texas Live Stock Association may be fairly classed as ranchmen and as owning ranges. If so, the cattle rendered by members of that organization equals sixty-six per cent of the total found in the entire State, and it is equally reasonable to suggest that only about one head in three was counted by the enumerators.

The only other district where more than a million head of cattle were found on ranges was the ninth, or New Mexico, where the total is returned as 1,054,022. The Pan Handle and the Indian Territory and the Public Land Strip are given credit for a little over nine hundred thousand head, and the western portions of the Dakotas and Montana with less than eight hundred thousand. The returns for the other districts are equally inadequate. In Nevada and Utah only seventy-eight thousand head of range cattle were discovered and enumerated, a fact which must have caused a smile to some of the big cattlemen of that portion of the country.

Coming down to the comments on the ranges or range districts, we find more matter of interest to the general reader, though there is a singular admixture of platitude with fact. The first range district, the report explains, is wholly in the State of Texas, and includes all counties in the western and southwestern portion of the State, omitting the Pan Handle or the extreme northwestern counties. This State contains the most successful stock-breeding grounds in the United States, the annual loss rarely exceeding five per cent, and more than ninety per cent of the calves dropped living to the age of three months. "The original stock of Texas cattle," the report is careful to explain, "came from Spain, and it is noted for its hardiness, energy in rustling for food, and devotion of the mother in protecting her young. With the exception of a small section, known as the Staked Plains, the range territory abounds in excellent feed for stock. Buffalo and mesquite grasses are the chief forage. Red top and blue stem are found below, and in the eastern part of the district the mesquite tree flourishes, its foliage and beans furnishing food hardly inferior to grain for fattening cattle. The surface of this district is generally rolling except the level tract along the Gulf, the western portion semi-arid and the water supply insufficient."

The remainder of the remarks on this range district, so far as cattle are concerned, are as follows: "Noting the large percentage of cows and small percentage of three and four year olds, the latter steers, it is plain that the energies of Texas cattlemen have been devoted rather to breeding than to maturing cattle. For more than twenty years they have marketed large numbers of live stock at the age of two and three years to Northern stockmen, who place them upon their ranges until matured; but that market is rapidly failing, and a change from the exclusive breeding of herds to that of maturing seems to be imperative. Between 1880 and 1885 the range stock business in the West, and particularly in the Southwest, attracted great attention from investors, speculators, and capitalists, both native and foreign, and experienced a great inflation of prices. That condition was followed by a corresponding reaction, and the stock industry was for a time seriously injured. This depressed condition is at present, however, giving way to a better feeling, owing to the advance in prices during the last few months. As settlement and cultivation advance in the eastern portion of the district, stockmen are securing cattle and fencing large pastures. Farther west, tracts of the State school land are secured by lease for a term of years at from two to ten cents per acre per annum and fenced. Range herding is passing away. With the fencing of ranges and change in the methods of handling stock, a better grade of horses is sought and the use of small ponies declining."

The second range district is also especially within the area which will be handled at some length in this work. It includes the Pan Handle, Texas; the Cherokee, Osage and Creek Reservations; the Cherokee Strip, and the Chickasaw Nation. In this district there were found a total of 921,314 cattle. Of these 487,734, or more than half, were in the Pan Handle. There were two hundred and three thousand cattle on the Cherokee Strip at the time the census was taken, which was three years prior to the opening of that country for public settlement. In the Cherokee, Osage, and Creek country nearly one hundred and sixty thousand head of cattle were found, in addition to seventy-three thousand in the Chickasaw Nation.

The remarks on this district are interesting and semi-historical in character. They call attention to the fact that it comprises thirty-five counties, and that most of the ground has been extensively occupied for the maturing of cattle bred further south. "The Indian Territory especially," the public is informed, "has been so used by large companies and associations of cattlemen, who lease the lands for grazing privileges from the Indian tribes, and by fencing large pastures with barbed wire dispense with herders. Each year nearly the entire stock is matured and sent to market and a new supply of young cattle from the South placed on the pastures; hence the percentage of sales is much larger from the Indian Territory than from any other area of like extent in the southern portion of the grazing regions. Range stock, as shown by the tables, is located in the Chickasaw, Creek, and Osage Reservations and the Cherokee Outlet or Strip. The large proportion of three and four year olds found in the Indian Territory indicates that the business is conducted chiefly to mature rather than to breed cattle. In ordinary years, when prices are satisfactory, all dry cows and four-year-olds, and most of the three-year-olds, are sent forward to market, and the pastures are replenished from Southern ranges. The cattle industry in the Indian Territory has been fairly satisfactory since 1880, excepting the year

1886, succeeding the great loss by the winter storms of 1885-'86. The business is controlled almost exclusively by white men, who are not citizens of the Territory or the members of any Indian tribe, and the presence of the stock and the men in charge have been in most instances productive of dissatisfaction among the Indians. By executive order, within a few years, cattlemen have been excluded from the Arapahoe and Cheyenne Indian Reservations, and in October, 1890, were required to vacate all reservations in the Indian Territory, excepting those of the so-called five civilized tribes, thus transferring an area of land almost equal to that of the State of Ohio from the grazing region, which is now being settled as the Territory of Oklahoma. The total losses of stock from all causes in 1889 were 13,938 head, a fraction over three per cent. No sheep are held on the ranges in the Indian Territory.

"The remaining portion of this district, the 'Pan Handle' of Texas, is an elevated country and is subject to severe storms. It embraces a part of the sandy, arid Staked Plains, and its natural supply of water is not equal to its grazing capacity, and resort to reservoirs and wells is necessary. The country bordering on the Staked Plains is broken and abounding in deep ravines and canons, which afford protection from winter storms. Titles to extensive tracts of grazing lands have been secured by ranchmen and capitalists, and the land is fenced into large pastures, some of which exceed in area that of a whole county. One company has secured title to and fenced and stocked three million acres. The special agents in this investigation enrolled in the 'Pan Handle' 487,734 cattle. In 1889 cattle to the value of $1,314,679 were sold at an average price of fourteen dollars and twenty-five cents per head for mature cows and steers. The large percentage of dry cows is an index to the loss of young calves by late spring storms. The industry as a whole has not been satisfactorily profitable since 1885, although at this time a better feeling prevails. The market for the mature stock of the 'Pan Handle' is the Eastern live stock centers. Very little attention has been given to the breeding or handling of horses in the thirty-five counties of the 'Pan Handle.' There are ten thousand three hundred and four horses, five hundred and seventeen mules, eight burros, and six hundred and seven swine reported, but no sheep."

Taking the first and second districts together, it will be seen that the enumerators discovered just two and three-quarter million head of range cattle in the entire State of Texas and the Indian Territory. They also found in the same district 236,952 farms, consisting of fifty-three thousand acres, of which about two-fifths were improved. The total number of live stock on these farms was returned in detail, and included one million and twenty thousand head of milch cows and 5,208,000 head of other cattle. This gives a total of cattle of all kinds in Texas and the Indian Territory, in June, 1890, of nearly nine millions, the figures not being so exceptionally wide of the mark, excepting those relating to range cattle. Little or no information is given as to value of the range cattle, but the total value of live stock in the district is placed at one hundred and six million dollars, counting only the animals found on farms. The estimate appears to be very little more than a wild guess and many points per cent below what any practical cattleman would make the appraisement. The total value of live stock found on farms in the entire south central division, which includes Kentucky, Tennessee, Alabama, Mississippi, Louisiana and Arkansas, in addition to Texas and the Indian Territory, was placed at one hundred and fifty million dollars, and the number of cattle found in this tier of States was eleven million two hundred thousand.

Ignoring the arbitrary numbering of divisions, and handling them rather in regard to their location and importance, we take next the eighth division or district, which, as we have already seen, comprises the Territory of Arizona. To this division credit is given for possessing nearly six hundred and sixty-six thousand head of ranch cattle and two hundred and sixty-eight thousand head of neat-cattle on farms, making a gross total of considerably less than a million. The importance of this district does not appear to have been realized by the census enumerators, or perhaps its vastness and the long distances between the ranges and settlements somewhat discouraged the enumerators, and tempted them to miss a good many ranches in the course of their work. But a very few lines are devoted to a description of the territory, which is credited with having only nine hundred and eighty-seven herds of cattle, a fact which bears out our suggestion that a great many herds were overlooked. The ranges, we are told, are not, as a rule, overcrowded, and the further information is given that as a range section Arizona is less crowded than any other grazing region in the United States. This fact is attributed to the distance from market and the long-continued hostilities of the Indians.

The report of Governor Hughes to the Secretary of the Interior for the year 1893 contains much more reliable information concerning the range cattle interests of Arizona. The number of cattle returned for assessment increased from 168,973 in 1883, to 720,940 in 1891, falling back to just below the half-million mark in 1893. The Governor explains the recent falling off, by remarking that the cattle industry of Arizona during the preceding two years had shared all the terrible privations that the cattle industry had had to bear throughout the Union, caused by the ruinous shrinkage of values, and in addition thereto, it had had heavy burdens to experience in meeting local casualties due to a destructive drought and overstocking the ranges, which there appeared to be no possibility of avoiding, even by those possessing capital and thorough knowledge of the business.

The completion of two transcontinental railways through northern and southern Arizona in 1880 and in 1881 suddenly opened up, in direct communications with the great cattle markets of the country, a vast grazing region in Arizona, untouched and of unsurpassed excellence, and the opportunity was seized by eager capitalists, both at home and abroad, to invest their capital with ill-judged haste in the new El Dorado. Thousands of cattle immediately subsequent to the completion of these lines were imported into the Territory from Mexico, and from Utah and Texas. For some years, with virgin pastures, the three and four-year-old steers were turned off in large numbers every fall from the ranges, soon after the expiration of the rainy season, and disposed of in the local markets and in California as prime beef, bringing profitable prices, and the business greatly prospered. As the herd increased, however, through importations and through their own offspring, the grass supply soon diminished throughout the Territory to such an extent that it was impossible to mature prime beef any longer on the open ranges, and the cattle owners were forced, at great pecuniary sacrifices in most instances, to sell their steers as feeders, at greatly reduced prices to buyers from California, Montana and Kansas.

The steers from two to five years old, as recently as the preceding spring, had been purchased by thousands and shipped to these States at considerable profit to the middleman, there to be matured for market. The cattle owners, realizing that the ranges were dangerously overstocked, and much loss in various ways was directly due to overcrowding, had made an earnest effort during the past two years to relieve them of every class of cattle that could bear shipment.

"While I have no accurate data at hand giving the exact number of cattle shipped," says the Governor, "it is estimated that over two hundred thousand head, consisting of all classes, were shipped from Arizona to California, Nevada, Montana, Kansas, Nebraska and Texas, during the year ending June 30, 1893. The severe drought that has prevailed, in consequence of a greatly diminished rainfall during the last two rainy seasons, has served to hasten the shipments and greatly add to the number of cattle sent away. Such has been the shrinkage, however, in the value of certain classes of cattle that the price received for them did not permit their owners to incur the financial risk of relieving their ranges to the extent that was desirable to escape disaster, even though the railroads penetrating the Territory made special rates 'for starving cattle,' and a serious loss has been thus experienced in every county of the Territory during the past year, due primarily, it is true, to the drought and overcrowding, but which the low price of cattle and the heavy cost of marketing them gave absolutely no relief from.

"While the item of live stock adds in a very material degree to the assessable value of most of the counties of the Territory, and their serious falling off in this direction in certain counties, as shown above, may perhaps temporarily embarrass for a few years two or three of the county governments in raising the customary revenue, the decrease, though an unfortunate thing as an investment to the individual, will not be without benefit to the Territory as a whole, and even to the industry itself.

"A trying experience has taught the cattle owners of Arizona many things that will be of value to them in their business in the future. They invested their capital in a country that was new to the American; they had much to learn by their own personal observations and experiences.

"Such is the history of the cattle industry of every new country in its experimental stage. Butit has now passed that stage in Arizona, and will advance hereafter on a more secure footing, avoiding the mistakes of the past. It has been clearly demonstrated, for example, that with the most favorable seasons, the best ranges will only carry a reasonable number of cattle, and that overcrowding not only destroys the grasses, but the cattle themselves, in spite of great care in breeding, deteriorate rapidly in physical development with scarcity of feed. The calf, unable to acquire a proper degree of nourishment

from an improperly fed mother, advances to the state of a yearling, undeveloped and rough, and possesses the same disadvantage when he enters the market as a steer, and is an objectionable and unsatisfactory commodity to both prepare for the market and to sell. There will be better grades of cattle grown in the future, and much more attention will be paid to quality. The business will not be conducted so loosely as in the past; more conservative methods will be adopted and less risks taken. Those who had no knowledge of the business, and entered it for the time being for purely speculative purposes, have been weeded out. There are reduced freight rates on the railroads, and many other advantages of an encouraging nature I might name have their value."

The system of the handling of cattle on the ranges in Arizona is similar to that of all the extreme Western States. Except when the condition of the cattle does not permit it, public round-ups are held both in the spring and fall. It is upon these occasions that the increase of the herds is branded and the steers are gathered for market. There is no extreme cold in Southern Arizona, save for a short period during midwinter in the most elevated portions of Yavapai and Coconino Counties. There is no part of the Territory where cattle cannot be gathered any month in the year off the ranges. Arizona is exempt from blizzards and entirely free from all contagious diseases among cattle. Since 1880, the report points out, rapid strides have been made in the improving of the herds of the Territory. At that time, about the only cattle there were those of Mexican or Spanish origin. The first improvement made was the introduction of shorthorns; but the great and noticeable improvement has been made by the introduction of the Herefords, they being essentially grass-fattening animals, and finding themselves at home upon every condition of mesa, mountain and valley range. Experiments have proven them superior in every desirable quality; they are being introduced on all ranges as fast as possible. Before the ranges were eaten out, from the combined effect of drought and overstocking, accurate accounts upon the largest ranches showed a yield of from ninety to ninety-five per cent, counting two-year-old heifers as producers, while last year these same ranches produced only ten per cent, and it is estimated that the yield this year will not be over five per cent. As a breeding country Arizona can not be excelled. Owing to the low price of cattle, there has been some tendency in the northern counties to substitute cattle for sheep on the open ranges. It is only, however, in a limited portion of the Territory where a change of this sort is anticipated.

The next census range district in the order of location is the ninth, which constitutes the Territory of New Mexico. Here the enumerators found a fraction over a million head of cattle, although, strange to say, they reported the sale for the year 1889 as nearly double that figure. On farms rather more than half a million head of cattle of all kinds were found, so that if the census figures were correct, New Mexico cattle raisers sold more cattle in 1889 than they actually possessed a year later. Certain conditions may have contributed toward this fact, but we are inclined to think that the New Mexico figures will be looked upon as exceptionally inaccurate. Of this district, the census return says that "white grama abounds on the levels, and buffalo and black grama grasses on the hills and low mountains; but large tracts of fine grazing lands are unavailable for lack of water, in which one-fourth of the grazing area of New Mexico is deficient, though to a considerable extent this difficulty has been met by wells, artificial pools and reservoirs. In 1880 the ranges of New Mexico were but sparsely covered with stock, and fully thirteen million acres, or one-sixth of the whole area of available pasture lands, were unoccupied. The Territory is now, as a whole, more densely occupied with stock than any other grazing region, excepting the range portion of Texas, and stockmen have complained of overstocking more than in any other district. The Territory seems of late to have been the recipient of surplus cattle from Colorado, Kansas and Texas; it is estimated that one hundred thousand head of cattle were sent back to Southwest Kansas and the public land strip during the fall season of 1890 for the purpose of securing food and temporary ranges.

"The western portion of the Territory is less densely stocked than the eastern half, and has suffered but little from that cause. Almost every county contains mountains, elevated table lands or mesas, foothills, and rolling and level areas of land. A scrubby growth of cedar and pinon abounds in the canons and upon elevated regions. Aside from the wants of the cattle ranges, but little attention is given to the raising of horses. They consist chiefly of small ponies of Spanish origin, and no exclusive horse ranch was reported. The sheep industry in New Mexico is extensive and profitable, as the dry

climate, soil, and short buffalo grasses are apparently well adapted to this husbandry. The Territory contained large flocks of sheep when acquired from Mexico, and the industry has been an important one since. Large flock owners usually place about three thousand head in charge of two shepherds, who move from one locality to another, living in tents or temporary huts and subsisting mainly on meats from the flock. A supply of corn meal and salt constitute the remaining fare, and a few sheep pelts their chief bed. They live in primitive simplicity, satisfied with meager wages. Their constant companions are the shepherd dogs, while the docile burro is their dependence for transportation of camp supplies."

The third range district comes next in point of proximity to Texas. "This range district," says the census reporter, "embraces Colorado, the western borders of Kansas and Nebraska and Wyoming. In 1880 the west one-third of Kansas was devoted to stock ranges, but since then regular farmers have absorbed the land to the exclusion of stockmen, and in 1890 there was no range stock in Kansas.* In Eastern Colorado the land and water privileges to a very great extent have passed under the control and ownership of farmers and wool growers. Intelligent resident stock men estimate that there are now less than one-half the number of range cattle in Eastern Colorado that there were in 1885. Nebraska is now practically out of the list of range-stock States, as farmers have taken possession of valley lands along the water courses, and stockmen are limited to the uplands and hills, and compelled to fence the lands they occupy.

"Wyoming, as a whole, is a farming and grazing region. The forage is principally buffalo grass on the hills and plains, and shrubbery on the mountains and in the valleys. There are also limited tracts of land grown with blue grass and red top, which afford a supply of hay so remarkable for its great weight and nutritive properties that no other food is required to fatten a domestic animal. This hay sells readily upon the ranches at fifteen dollars per ton. Buffalo grass is very nutritious and produces the fattest of beef and mutton. It is asserted that a Texas-bred full-grown bullock in one year will increase in weight four hundred pounds when put upon Wyoming ranges. The years 1888 and 1889 were below the average in point of moisture, producing a corresponding scarcity of grass, and large numbers of cattle from Colorado and other southern points were driven into Wyoming, seriously threatening to overstock the ranges, and consequently to reduce the weight and fine condition of mature stock. Prior to this time the average gross weight of mature Wyoming steers was one thousand five hundred and fifty pounds. As a result of overcrowding, large numbers of cattle have been moved to Montana and other States during 1890.

"Wool growing and mutton producing are the most prosperous branches of the live-stock industry on the ranges of Wyoming, and have contributed to limit and injure the cattle industry, which can not compete with the former in holding a given range, for cattle will not feed where sheep have grazed. The flocks are of high grade Merino and Southdown, and an average fleece of seven and five-tenths pounds is claimed. The mutton of Wyoming ranks high in Eastern markets, to which thousands of sheep are forwarded annually. The ranges of Albany, Carbon and Laramie Counties are, to a great extent, fenced into large pastures, and the stock in those counties is of excellent grade, having been greatly improved by the use of superior breeds of cattle and horses. Considerable attention is given to breeding draught horses as well as horses for speed, the latter being shipped to Eastern markets. It is claimed that the climate and high altitude secure greater power of endurance and greater "toughness" in the horse than can be secured in lower altitudes.

"In Colorado, under rapidly changing conditions, range cattle are now mostly located upon the western side of the mountains. It is estimated that one hundred thousand head of cattle were driven from Eastern Colorado to Montana in 1890. Farms are taking the place of ranges. Sheep are rapidly becoming the live stock interests of Eastern Colorado, and it bids fair to become an almost exclusively wool growing region. The number of horses reported is 31,209. The range-horse industry is reported as depressed and sales light, especially in Eastern Colorado, mature horses selling at thirty-seven dollars and fifty cents, and by herds or bands at twenty dollars per head. But few mules or burros are reported on ranges in Colorado, although 4,296 were used on farms, and at mines for freighting purposes."

* This is the statement of the Census Bureau and not ours. It implies that the whole of Kansas was fenced up in 1890, which it certainly was not.

In this vast area less than seven hundred thousand head of cattle were enumerated on ranges. In Wyoming and Colorado, one million, four hundred thousand head were found on farms, of which 3,125 were located in Wyoming and rather more than five times that number in the great silver State which has been so conspicuously before the country during the last two years.

Nearly eight hundred thousand cattle were found on ranches in Montana and South Dakota. Nearly all these were in Montana, only 5,192 being returned from South Dakota. Nearly seven hundred thousand head of cattle of all kinds were also found on Montana farms, and about the same number in the southern half of Dakota. Of the district made up of the two States the report says: "The State of Montana was among the last to attract the attention and confidence of range stockmen on account of its cold winters; but, following the large and profitable mining camps in 1881 and 1882, large herds of cattle from various States, but chiefly from Texas, were located in Montana, and preparations made for permanent stock ranching. In no other range section has the development of Southern-bred cattle been so marked and satisfactory. The upper Missouri and many of its tributaries drain the State, affording a well-distributed water supply, while the mountains, foothills, canons, and ravines furnish the needed natural protection from storms. The ordinary annual loss of livestock is less than six per cent, and many range men report less than three per cent. The winter of 1886-87 was an exception, and heavy losses occurred; but in the three succeeding years the stock interests of the State rapidly recuperated, and Montana cattle have an excellent reputation in Eastern markets. But little attention, comparatively, is given to regular farming, and the ranges as a rule are not fenced, the stock being held within the lines of a given location by a system of 'line riding.' The expense incident to holding a bullock one year is less than one dollar, and many thousands are held at that figure on contract. The enrollment of range stock in Montana in this investigation shows 750,619 head of cattle and 32,939 horses owned by individuals, firms, or companies. Montana range horsemen are breeding heavy draught animals and securing a class of stock that is good for all purposes. But little attention is given to mules, only one hundred and forty-one being reported.

"Sheep men are securing a foothold in the eastern portion of the State, and during 1889 and 1890 large numbers of sheep have reached Montana from Oregon, Washington, and other States. It is found that not only a superior grade of wool, but also an excellent grade of mutton is produced in Montana, and considerable attention is being given to the breeding of Southdown, Leicester, and other mutton-producing classes of sheep. Many cattlemen are exchanging their herds of cattle for flocks of sheep, and Eastern men are investing largely in the business. The number of sheep reported from Montana was 493,870, and the amount of the wool clip was 2,841,916 pounds. The average weight of fleece is a fraction less than six pounds, although sheep men claim that this average is reduced by the presence of large numbers of sheep which came into the State after being sheared elsewhere, and that the true average is about seven pounds. The range-stock industry of Montana can be reported as in a prosperous condition."

The fifth range district, covering the whole of Idaho, Eastern Oregon and Washington, is most distinguished in the census returns for its immense sheep record, this district being credited with one-fifth the entire number of sheep on the American ranges. The total number of cattle located by the enumerators was five hundred and forty-two thousand. About half of these were found on ranges in Eastern Oregon. Washington contributed but sixty-one thousand to the total. The number of cattle found on farms in Oregon was half a million, just twice the number of those returned from Washington. Idaho does not show up in the return quite so well as Washington.

Of the district including the whole of Idaho and most of Oregon and Washington a few notes are appended in the report. Thus the best grazing lands of Idaho are said to be the foothills of the mountains. The chief river valleys abound with sage brush, but contain little grass. The ordinary annual loss of stock from all causes is about six per cent, but the winter of 1889-90 was exceptionally severe in Idaho, and, in consequence, stockmen were much discouraged. Washington can not much longer claim to be a range-stock State. Wheat growers are rapidly appropriating the ranges, and only ten counties, located in the eastern portion of the State, have range stock, and these in limited numbers. The loss in 1889 by winter storms is reported at fully fifty per cent of all stock. The

number of range cattle is given at 61,105, range horses at 24,299, and sheep at 208,218. In 1880 Washington as a Territory was a flourishing grazing district. It is now a flourishing wheat field.

"Eastern Oregon," says the report, "including the counties of Baker, Crook, Gilliam, Grant, Harney, Klamath, Lake, Malheur, Morrow, Umatilla, Union, Wallowa and Wasco, consists of a succession of low mountains, interspersed with valleys and wide areas of rolling land. In its natural state the mountains are covered with timber, but generally not so dense as to prevent the growth of grass. The rolling lands and valleys constitute the chief ranges, especially in the winter season; in summer the mountain ranges are utilized. Heavy losses by winter storms make it prudent to provide hay to be used when the ranges are covered with deep snow. The ordinary annual loss is about six per cent, but in the winter of 1889-90 it reached fully thirty per cent. The figures of range stock for eastern ranges are: Cattle, 263,581; horses, 94,469; sheep, 1,170,116. Although the losses of sheep in 1889 were extremely heavy (in some instances seventy-five per cent), yet wool growers are hopeful and confident of the future. The flocks of Eastern Oregon are noted for the heavy average weight of fleece, reaching seven pounds for mixed and ten pounds for dry flocks."

Nevada and Utah are included in the sixth district. The former is described as a mountainous country, and the stock ranges as confined to narrow valleys, foothills, and minor divides between small water courses. The eastern limit of the State includes a small portion of the Salt Lake desert, and the southern portion is to a great extent a desert, affording little grass and no water. Bunch grass grows on the uplands, and the coarse slough grass along the boarders of the streams, and whenever irrigation is practicable the cultivated soil yields abundantly. Alfalfa is much grown, and is the chief reliance for hay. The years 1887, 1888 and 1889 were very dry, and pasturage was cut short, while the winter of 1889-90 was exceptionally severe and protracted. Heavy losses of all kinds of range stock were sustained, and the industry has since then been much depressed. The mature stock of Nevada finds a market in the cities of California.

The western portion of Utah, embracing a large area of level, land is described in detail in the bulletin as a desert, upon which but little other vegetation than sagebrush and grease wood is found. Wherever the desert lands of Utah have been irrigated they are found to be very productive, but the supply of water is insufficient, and only limited areas along the streams and foothills can be irrigated. The Wasatch Mountains afford the chief summer-range district and principal source of water supply. Herds and flocks graze over the highlands during the summer season, and are turned upon the valley and desert ranges in the winter. The range cattle and horse industries are declining, while that connected with farms is more satisfactory and increasing steadily. The farmer provides winter feed, avoiding the losses to which rangemen are subjected, and is able to supply the market with mature stock at the season of its hightest price. Wool-growers are also rapidly appropriating the range feeding grounds. The eastern and southern portion of Utah is a rough, mountainous country, and generally a desert, but when water can be secured for irrigation the most desolate valley becomes highly productive. The stockmen of Summit and Wasatch Counties place their stock upon the ranges of the Uintah Indian Reservation, affording considerable revenue to the Indians, who receive one dollar per head per annum for cattle and horses. Sheep are found in every county except Grand, but the northern portion of the Territory is the chief range. It is reported that overstocking and constant grazing are gradually destroying the ranges of Utah, and while the range cattle and horse industry has of late years been greatly depressed, wool-growers have been flourishing.

The seventh district embraces California. Speaking of this the census report says that the chief ranges are in the southern counties, and constitute one-half its area. In the valleys of the extreme northern portion of the State some range stock is found, but the high altitude, limited ranges and liability to severe winter storms render extensive operations precarious. The severe storms of the winter 1889-90 entailed severe losses on stockmen who had not provided sufficient forage. In Southern California farming is by no means abandoned in localities more distant from railroads. In Southern California the range cattlemen and horsemen give some degree of attention to grading up their herds, and are generally satisfied with the results of their business, but neither report much satisfaction as to wool growing. The best ranges of the southern portion of the State in former years have passed to the use of fruit growers and farmers, and range stock is relegated to the eastern slope of the mountains

and the non-irrigable lands in Fresno, Kern, San Bernardino, San Diego and Tulare Counties. The ranges in the central portion of the State are to a large extent fenced and the business more definite and certain, so that the stock thereon may be practically classed as farm stock. Outside of the stock taken by the regular enumerators as on farms, this investigation shows upon the ranges in California in the census year 1890, 241,300 cattle, 22,542 horses, 1,408 mules, 897,896 sheep, and 91,110 swine, with 1,782 men employed as herders, etc.

The enumerators found sixty million head of live-stock on fifty-two thousand farms in California. This included 1,367,118 head of neat-cattle; eleven thousand were working oxen, and about a million cattle in the sense of the word used generally in this work.

The census return of cattle on ranges devotes a little space to ranges outside of the districts covered by the nine divisions, including small parts of Florida and portions of Alabama, Georgia and Louisiana, of which it says:

"In Florida and small portions of Alabama, Georgia and Louisiana are found ranges upon which stock is kept, but in nearly all cases in connection with other farm or plantation operations. The stock of these States might rightly be classed as farm stock. and was so enrolled by the regular census enumerators, for which reason it does not appear in the tables of this bulletin. In Florida cattle and wool growing are increasing, especially on the elevated lands. The class of sheep found are mainly coarse wool, and shear an average fleece of two and one-fourth pounds. No attention is given to horses, mules, or swine as range stock in Florida. Cattle are found upon the level and swampy lands of the coast and lower peninsula. The cattle of Florida are of Spanish origin and very small, a mature bullock dressed weighing from two hundred and fifty to three hundred pounds net. The uniform price of cattle is ten dollars per head delivered at the shipping point, and the selling price of herds upon ranges is five dollars per head. A record is made of the number of calves branded annually, and the number of the herd is recorded, bought and sold by the record of calves branded. The rule is that the number of calves branded equals one-fifth of the herd. To illustrate, if five hundred calves are branded the herd is reckoned at two thousand five hundred head. No herding of cattle is done, nor are they kept within enclosures, but are allowed to roam at will, the brand determining the ownership. Wild animals and alligators destroy many of the calves, causing an estimated loss of five per cent. All efforts to improve the herds of Florida by the introduction of superior breeds of cattle have practically failed, owing to climatic causes. The calves are branded and the mature cattle gathered by men who follow the business for a livelihood on contract at a stipulated price of fifty cents for each calf branded, and a dollar a head for each mature bullock delivered at the shipping yard. These two items, amounting to one dollar and fifty cents per head, constitute about all the expense of producing a mature bullock and placing it on the cars ready for market."

Whether the concluding remarks are intended to apply to the cattle interests generally, or to the "other districts" only, does not appear, this being one of the many points exceedingly obscure in the bulletin, which concludes with a contradiction. As already noted, it is stated in the first paragraph that the industry is found to be "more generally prosperous at this time than for several years previous." The concluding paragraph on the other hand reads, "At the time of this investigation (the summer and fall of 1890), as will be noted in the reports from various districts, the range-stock industry was not in a highly flourishing condition, aside from sheep and wool growing, by reason of the reaction from the 'boom' years previous to 1885, occasioned by low prices and overstocking the ranges, together with unusual losses from winter storms; but within the present year an entire change has taken place, and a very marked advance in prices is now prevailing. While range-stock breeding and feeding in this country will probably never again reach its former large proportions in territory and products, the immediate future seems bright for it as a profitable industry on the changed lines and conditions that now prevail."

So, in the words of the showman, "you pays your money and you takes your choice." You take the bulletin and read it. You believe its optimistic introductory or its pessimistic peroration, which ever pleases you most; and if you do neither, you perhaps come as near hitting it.

The following are the range tables, so far as they apply to cattle:

CLASSIFICATION OF CATTLE AND AMOUNT OF SALES.

DISTRICTS.	Total number of cattle.	Cows and calves.	Per cent of cows and calves.	Number of dry cows.	Per cent of dry cows.	Number of yearlings.	Per cent of yearlings.
Grand total	6,828,182	2,144,545	31.41	861,345	12.62	1,332,460	19.51
First district	1,854,349	667,565	36.00	296,695	16.00	389,417	21.00
Second district	921,314	155,165	16.84	134,733	14.63	118,685	12.88

From Bulletin No. 378 (Statistics of Agriculture) we extract those points which appear to be of special interest to cattlemen and their friends:

The total number of farms enumerated in 1890 was 4,564,641, as compared with a total of 4,008,907 in 1880, an increase of 505,734, or 13.86 per cent.

The total area of land in these farms in 1890 was 623,218,619 acres, 357,616,755 acres of which were improved. In 1880 there were 536,081,835 acres in farms, 284,771,042 acres of which were improved. Therefore, there was an in increase of 87,136,784 acres, or 16.25 per cent of the total land in farms, and 72,845,713 acres, or 25.58 per cent, improved.

The percentage of the total land surface in farms in 1890 was 32.79, as compared with 28.20 in 1880, and the percentage of the total farm area that remained unimproved at the latter date was 42.62, as compared with 46.88 at the former.

The value of these farm lands, including fences and buildings, in 1890, was $13,279,252,649, and in 1880, $10,197,096,776, showing an increase of 30.23 per cent in their valuation since 1880.

The value of farm implements and machinery in 1890 on these farms was $494,247,467, and in 1880, $406,520,055, showing an increase of 21.58 per cent since 1880.

The value of live stock on hand June 1, 1890, on these farms was $2,208,767,573, and the value in June, 1880, was $1,500,384,707, showing an increase of 47.21 per cent since 1880.

In the year 1889 the value of farm products was $2,460,107,454, and in the year 1879 the value was $2,212,540,927, showing an increase of 11.19 per cent since 1880.

There were 1,117,494 working oxen, 16,511,930 milch cows, and 33,734,128 other cattle, making a total of 51,363,572 neat-cattle on farms in the United States on June 1, 1890, as compared with 993,841 working oxen, 12,443,120 milch cows, and 22,488,550 other cattle, making a total of 35,925,511 in 1880. There is therefore an increase of 123,653, or 12.44 per cent, in the number of working oxen; of 4,068,830, or 32.70 per cent, in the number of milch cows, and of 11,245,578, or 50.01 per cent, in the number of other cattle, the increase in the total number of neat-cattle on farms being 15,438,061, or 42.97 per cent. In addition to the above there were 6,285,220 neat-cattle reported on ranges June 1, 1890, making a total of neat-cattle on farms and ranges of 57,648,792.

The tables in this bulletin present a mass of figures not all of them germane to our subject. The writer of the introductory and historical chapters has therefore condensed and abbreviated them, leaving out all outside matters, and in the process making references to information actually needed from time to time much easier than in the original form.

NUMBER OF LIVE STOCK ON FARMS (EXCLUSIVE OF THOSE ON RANGES).

There was a slight increase in the number of cattle on farms in 1891, amounting according to official figures to about one hundred thousand for the year. Prices fell during the same period, the average value declining from fifteen dollars and twenty-one cents to fourteen dollars and seventy-six cents. The official figures for the year 1891 in the States and Territories specially covered by this work were as follows:

	No. of Milch Cows.	Value per head.	No. of Oxen and other Cattle.	Value per head.
Texas	851,775	$ 14.13	7,024,496	$ 8.89
New Mexico	19,356	20.00	1,341,856	11.01
Arizona	16,790	27.50	725,004	14.00
Colorado	62,285	28.11	1,017,465	15.77

The estimated official valuation of milch cows varied from thirteen dollars and seventy-five cents per head in Arkansas to thirty-seven dollars in Washington. The value per head of "oxen and other cattle" approximated nine dollars in Texas, Arkansas, Florida, Mississippi and Alabama, running up as high as twenty-seven dollars in New York, twenty-eighty dollars in New Jersey, and even sixty cents higher still in Connecticut. Many range men challenge the accuracy of these official averages, but even if they are not altogether accurate, they form an index of values which is well worth preserving in the cattleman's archives.

In 1892 the figures were a fraction better, being as under:

	No. of Milch Cows.	Value per head.	No. of Oxen and other Cattle.	Value per head.
Texas	868,811	$ 14.25	7,024,496	$ 8.85
New Mexico	18,775	20.00	1,288,182	11.01
Arizona	17,979	25.00	761,254	15.00
Colorado	60,416	26.00	1,037,814	16.49

The report of the Secretary of Agriculture for 1893 speaks with gratification of the improved class of cattle in Texas, and then in a rather doleful paragraph hints very broadly that the census of 1890 was not, to use one of Mrs. Grundy's favorite expressions, "any better than it ought to be." "There is a decrease," says the report, "in the number of store cattle. The scarcity of feed in Virginia induced farmers to sell off feeding bullocks closely. The no-fence law in some of the Southern States has caused a reduction of numbers, the more worthless of the old stock having been sacrificed to the manifest improvement of the existing herds. The low price of cattle in the ranch regions, and the discouragement after long waiting for a rise, has tended to reduce the numbers of cattle. In some States there has been a reduction made, after investigation covering the changes of recent years, from the estimates of last year. It was hoped that the results of the national census of 1890 would be available in the comparison and revision of data collected, but up to the date of issue of this report it is not at hand, nothing having been received, excepting a statement of farm animals on ranges, which is not an enumeration, but the result of local estimates, and therefore differing little from our own substitute for a true census."

A marked decrease, amounting to one million six hundred and ninety-seven thousand and forty-three, is recorded, or rather estimated, in the number of "oxen and other cattle," with a nominal increase in the number of milch cows. An increase of a few cents per head in values is spoken of, and a series of tables are given, from which we take the following:

	No. of Milch Cows.	Value per head.	No. of Oxen and other Cattle.	Value per head.
Texas	816,682	$ 14.50	6,462,536	$ 9.05
New Mexico	18,400	20.00	1,249,537	10.03
Arizona	16,907	21.00	822,154	15.10
Colorado	63,437	25.50	830,251	16.90

As the census bulletins remind us, there is a fertile country between Texas, Kansas and Arkansas, known as the Indian Territory and Oklahoma Territory. The existence of this district and of these two Territories does not appear to be known to the Department of Agriculture, which is silent as to the number of cattle to be found on the pastures, and their values, actual or estimated. Before the cattle were driven off the Cherokee Strip there were at least a million head grazing and fattening on the luxurious blue grass of this "land of promise and the Indian's paradise." Now the best information

we can obtain places the figures at about two hundred thousand, and the values as about those given for Texas, a large percentage of the animals being fat beeves.

The last detailed official statement published as to the value of milch cows and of cattle of various ages forms the last of the series of unavoidable tables in a chapter on the present magnitude and importance of the cattle industry.

STATES AND TERRITORIES.	Milch cows.	Oxen and Other Cattle.

We had intended following up these figures with a strong endorsement of the movement in favor of the creation of a Bureau of Information and Statistics in Live Stock, as already referred to. But we think the figures given, and the information that is unavoidably withheld, form a stronger appeal in favor of the proposed legislation than any words of ours could do. Mr. W. L. Black, of Texas, is chairman of the committee, and his associates are J. F. Waters (Arizona), L. Minor (Arkansas), A. M. Pryor (Colorado), W. T. Vandeveer (Illinois), H. A. Heath (Kansas), C. F. Clark (Missouri), E. Mothersill (New Mexico), E. Filley (Nebraska), Ralph Friend (Wyoming), and Saml. Mayes (Indian Territory). Mr. Black, in reply to a request for the latest information on this subject, speaks most hopefully and argues most conclusively. He points out that there were in January, 1892, 14,570,638 cattle in the range States, and 13,985,638 in the feeding States, exclusive of milch cows. He divides the total, 28,531,250, into seven classes, and estimates that there were 10,375,000 breeding cows, half that number of calves, and about two and a half million each of steers under two years, heifers of same age; steers under three years, heifers of same age, and steers over three years. He regarded these figures as indicative of something like a famine in 1894, and thinks the result was not far wide of his calculation. He regards the change in the tariff so as to admit Mexican and Canadian cattle as another argument in favor of the establishing of the Bureau, which could keep a correct record of such shipments. Mr. Black first proposed to organize a Texas Cattle Exchange, but changed the name owing to the prejudice in some quarters against existing institutions known as "exchanges." In his first manifesto, issued in February, 1888, he said:

"It seems to me we are engaged in a business that is not conducted upon correct business principles. In other words, we do not know either the 'supply' or 'demand' of our product. What would we think of a manufacturer who would go on carelessly for years producing an article without knowing the demand for his goods?

"Yet, are not the cattle producers guilty of this folly?

"Permit me, therefore, to suggest that you call together as many representative Texas cattle owners as you can, to meet at Fort Worth as soon as convenient, and let us organize 'The Texas Cattle Exchange.' The more who will take an interest in such an organization the better, though I would suggest that fifty or one hundred would accomplish as much as if every cattle owner in the State were present. What we need to do is to systemize our business, and I feel quite satisfied there is enough business ability in Fort Worth alone to do this, and the quicker it is done the better. If we are producing more than the demand justifies, we ought to put the knife to some of our heifers and stop the over-production.

"It was my privilege to be connected with the cotton trade soon after the close of the war, and at that time Liverpool had the same absolute control of cotton as Chicago has to-day of cattle. A handful of enterprising cotton men determined to correct this, and they established the 'New York Cotton Exchange.' The result of their work is too well known to need any comment. In less than twelve months from the time they organized the system was recognized by the whole country as being the only correct one, and all other States followed their example. I feel quite convinced that the organization of the 'Texas Cattle Exchange' will meet the same happy results.

"As the cattle industry is so extended it would appear, at the first glance, a very doubtful question as to the practicability of organizing such a system. Yet when we consider how widely distributed the wheat product is, and with what accuracy the 'supply and demand' of wheat is kept up with, the feasibility of a cattle exchange is, I think, an assured fact. It only wants a beginning, and I would be proud if Texas, my adopted home, will take the initiative in this important step. It would be advisable to make dealers, as well as producers, eligible to membership, and thus get support from Chicago, St. Louis and Kansas City, as well as from business men in West Texas, who are so directly interested in the prosperity of the cattle business. An active secretary would have very little trouble in communicating with every producer in the State, and obtaining the necessary information as to 'supply.' The 'demand' in Chicago, Kansas City, St. Louis and New Orleans could be easily ascertained, and it would be but a small matter to keep up his work.

"The 'demand' should be followed from day to day, but it would hardly be necessary to communicate with the producers more than twice a year—say spring and fall—at which time any change in ownership could be noted, sales to interior points, the calf crop, etc., etc. Monthly or weekly circulars would, I think, be of great interest to the producers, showing the movement of cattle, prices, etc., and they would serve to keep alive the organization. The important consuming markets are the only ones we need to keep up with, and if we can ascertain the 'supply and demand' as relates to Chicago, St. Louis, Kansas City and New Orleans, the problem will be solved and the price of cattle controlled.

"A comparison of the cattle business, as it is now carried on, with any other well organized trade may be of some interest. If a 'die-out' occurs in cattle, the immediate result is a general depression in the business. Confidence is lost by the bankers who lend their money, and a scare on the part of investors is quite apparent throughout the entire country. The cattle business is characterized as a very dangerous one, and the fact that no one cares to invest or speculate in the business makes hard times for the cattle owner."

In a letter to the writer, dated October 27, 1894, Mr. Black defines his present position even more clearly. "The idea originated with me," he writes. "My long connection with trade and commerce, as carried on through the modern system of our exchanges, where a member can, at a glance, inform himself of the true situation of supply and demand, prompted me to have the same improved system applied to our cattle trade when I took charge of my ranch in 1884. The first convention that was called for the purpose of submitting the plan to the cattlemen was in 1890 at Fort Worth, Texas, and you will observe from the report of the Government Department of Agriculture that the matter was regarded of such great importance as to call for a special report of the proceedings.

"The cattlemen as a general thing are not familiar enough with commercial customs to fully realize the advantage that this Bureau will afford them, and I will take the liberty of outlining to you a few of them, which you may perhaps find occasion to refer to in your comments on the proposed bill now in Congress.

"1. We are scattered in twenty-two different States, and are ignorant of each other's doings and holdings.

"2. The representatives of the producer are scattered all over these twenty-two States soliciting trade from ranchmen.

"3. It is necessary to concentrate these agents or representatives in as close a body as possible.

"4. Hence the plan for a State Secretary for each of the twenty-two States.

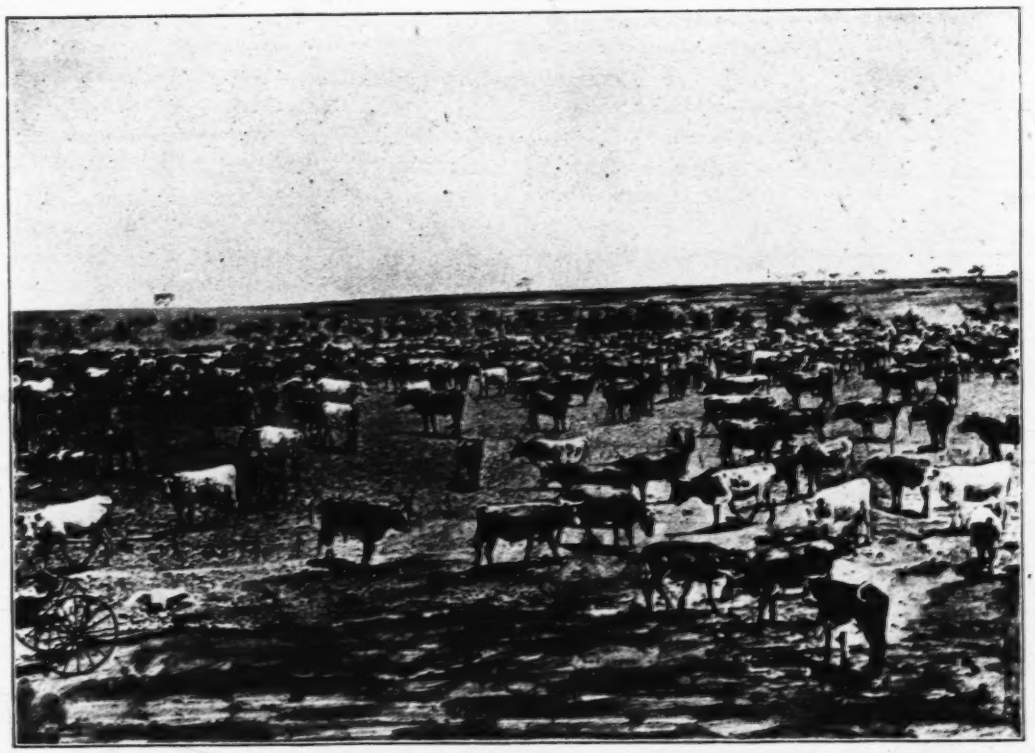
"We will now take the State of Texas as an illustration for all. The Secretary will be located, we will assume, at Fort Worth, and as he will secure daily information from every other State Secretary relating to shipments to different markets, it is natural to suppose these agents, or representatives of ranchmen, will locate at Fort Worth to have daily access to the Secretary's rooms. This will concentrate the agent of every ranchman in Texas in one place.

"Now, we will suppose I want to sell a lot of cattle or sheep. I simply notify my agent on the floor of the Bureau (or Exchange) and he communicates with the agents of all the other ranchmen in Texas in a few moments, and will naturally find me a customer for my stock in a short time, and write or telegraph me an offer. If we find it necessary to hold back our shipment for a short time, to enable the packers to dispose of any large amount of stuff they may have in their cold-storage rooms, we can do so. In addition to other advantages, the Bureau will inform shippers of the number of cattle, sheep or hogs en route to each market daily, thus avoiding glutted markets. At the present time we have no means of telling how many head of cattle are on the road to market. Hence it can be seen how easy it is to cause a glut in the market at any time. It will be very easy for our agents to agree to recommend their different clients to hold their stock for the period agreed on. This will force the packers to come to the point of production to supply their wants, and it is my firm belief that this will be the result of our Bureau soon after it is established, instead of the producer being forced to ship his stock to market, and be subject to the dictation of the Big Four. These gentlemen will be forced to locate agents at our different Bureaus, and trade direct with us, thus relieving the producer of the risk of shipments, the ranger of over-supplying the market, and the unnecessary charges of holding in the stock yards at points of sale markets.

"It is just as easy for the Big Four to supply their wants in this way as to have the producer take all the risks he does now. But they will never consent to do this unless we are in position to combine against them, and I can conceive of no plan that will bring the cattlemen together easier and quicker than through the agency of the proposed Bureau of Infonnation and Satistics. I have not referred to the hog product in my memorial to any great extent, but it will benefit this branch of live stock quite as much as cattle and sheep."

Mr. Black's reference to the change in the tariff law, and the introduction of cattle from Mexico, opens up a question too general to be discussed very definitely at this stage. The "CHICAGO DROVERS' JOURNAL," said on this subject late in October, 1894:

"Shipments of cattle from Old Mexico to Chicago is a new feature in the live stock business and one not calculated to make the average Texas stockman feel very cheerful. While Mexico is by no means the cattle-raising country that Texas is, the fact that the new tariff act permits shipments to this country at a profit may encourage an expansion of the cattle business in that country that may give Texas a lively competition. Of course, the duty will handicap Mexican stockmen and tend to stop the business, yet as long as there is any profit in it, some shipments may be expected. The trial shipment of last week was a success financially, and already the dispatches state that more cattle are being prepared for shipment. The Cheesman ranch, near Sabinas, is said to contain nearly one hundred thousand head of cattle, and it is rumored a big share of these will be sent to Chicago if prices are favorable. Under the former law it cost ten dollars per head to get the cattle across the line regardless of their quality. Now at the ad valorem rate the duty is much less, and in the case of the recent shipment was a fraction more than two dollars per head. The first lot of cattle marketed here sold at two dollars and forty-five cents for eight hundred and twenty-one pound steers, and two dollars and twenty-five cents for seven hundred and sixty-two pound cows. These cattle were originally Texans and bore well-known Texas brands. They had been taken across the border, just under what conditions it cannot be stated."



A RANCH SCENE IN TEXAS.

CHAPTER II.

Cattle Raising in the Remote Past.

THE Bible affords us the first records of cattle ranches and cattle raising. In the earliest chapters of Scripture mention is made of cattle, and for many years, and indeed generations, a man's wealth was estimated by the number of animals he possessed, while in the absence of a circulating medium, cattle passed very much in the form of money. Holy writ tells us of two patriarchs who, having decided that they had better agree to differ, divided up their herds and flocks, and drove off in two different directions. From that day forward we have records in various forms and shapes about cattle and cattle raising, and while some people think it a matter of pride to be able to trace back their ancestry for several generations and centuries, it is certain that the cattle raiser can prove that his calling was in good repute hundreds and even thousands of years ago.

So far as this work is concerned, it is not necessary for us to dive deeply into the realms of antiquity. At the same time we desire to carry our narrative from an early stage up to the present time, and hence may be pardoned for dwelling briefly on a portion of the history of cattle which is now a closed book. Originally the word "cattle" was used to cover all domesticated animals, but in modern times the term has been applied only to those animals which belong to the genus *Bos*. This genus has been divided by naturalists into two groups, the hump back and the straight back. From the latter modern cattle have descended, although the process of descent is not as thoroughly understood or known as might be desired. A fuller knowledge would be interesting, for it would give a tangible history of the immense herds of wild cattle of South America, Mexico, and of this country. Unfortunately, beyond the general statement that these have descended from bunches of cattle brought here by Spanish pioneers, but little can be gleaned from authorities. It is surmised that some of these animals escaped from captivity, or were abandoned in consequence of the difficulties of early settlement of pioneer life, and that running wild they multiplied so rapidly that the time came when they were slaughtered for their hides, especially in the Southern portion of this continent.

Mr. Henry Inman, in his interesting work on the Sante Fe Trail, quotes from the memorable journey that Coronado made through the Southwest over three hundred and fifty years ago. In this history there is a record of lodges made of tanned cow or buffalo skins on the Rio Grande River, and there are other references to the immense herds of cattle, or probably buffalo, which were found in every direction. In Hakluyt's "Voyages," published in London in the year 1600, the plains which have since become the headquarters of the cattle trade of the United States, and indeed of the world, are quaintly described. "From Cicuye," says the historian, "they went to Quivira, which, after their account, is almost three hundred leagues distant, through mighty plains and sandy heaths, so smooth and wearisome, and bare of wood, that they left marks that they might not lose themselves at their return; for three horses were lost on that plain, and one Spaniard which went from his company on hunting.

"All that way of plains are as full of crooked-back oxen as the Mountain Serrena in Spain, but there is no such people as keep those cattle.

"They were a great succor for the hungry and want of bread, which our people stood in need of.

"One day it rained in that plain a great shower of hail, as big as oranges, which caused many tears, weakness and bowes.

"Quivira is in forty degrees, it is a temperate country, and hath very good waters and much grass, plums, mulberries, nuts, melons and grapes, which ripen very well.

"There is no cotton, and the natives of that country apparel themselves with ox-hides and deer skins.

"Many of our people sought to have dwelt there, but Coronado would not consent, saying they could not maintain, nor defend, themselves in so poor a country, and so far from succor.

"They traveled about nine hundred leagues in this country. All the way between Cicuye and Quivira is a vast plain without trees and stones, and hath but few and small towns.

"The men clothe themselves with leather, and the women, which are esteemed for their long locks, cover their heads with the same.

"They have no bread or any kind of grain, as they say, which I accounted a very great matter.

"Their chief food is flesh, and that oftentimes they eat raw, either of custom or for lack of wood. They eat the fat as they take it out of the ox, and drink the blood hot, and do not die withal, though the ancient writers say that it killeth, as Empedecles and others affirmed. They drink it also cold, dissolved in water.

"They seethe not the flesh for lack of pots, but roast it, or to say more properly, warm it at a fire of ox-dung; when they claw their meat but little, and raven up much, and holding the flesh with their teeth, they cut with razors of stone, which seemeth to be great bestiality; but such is their manner of living and fashion.

"They go together in companies, and move from one place to another, as the wild Moores of Barbary, called Alarbes, do, following the seasons and the pastures after their oxen.

"These oxen are of the bigness and color of our bulls, but their bones are not so great. They have a great bunch upon their fore-shoulder, and more hair on their fore part than on their hinder part, and it is like wool. They have, as it were, a horse-mane upon their backbone, and much hair, and very long from their knees downward.

"They have great tufts of hair hanging down their foreheads, and it seemeth they have beards because of the great store of hair hanging down at their chins and throats.

"The males have very long tails, and great knob or flock at the end, so that in some respects they resemble the lion, and in some other the camel.

"They push with their horns, they run, they overtake and kill a horse when they are in their rage and anger.

"Finally, it is a foul and fierce beast of countenance and form of body.

"The horses fled from them, either because of their deformed shape, or else because they had never before seen them.

"Their masters have no other riches nor substance; of them they eat, they drink, they apparel, they shoe themselves, and of their hide they make many things, as houses, shoes, and apparel and ropes; of their bones they make bodkins; of their sinews and hair, thread; of their horns, mawes and bladders, vessels; of their dung, fire, and of their calves' skins, budgets, wherein they draw and keep water. To be short, they make as many things of them as they have need of, or as many as suffice them in the use of this life.

"There are also in this country other beasts as big as horses, which, because they have horns and fine wool, they are called sheep; and they say that every horn of them weigheth fifty pounds weight.

"There are also great many dogs which will fight with a bull, and will carry fifty pounds weight in sacks when they go hunting, or when they remove from place to place with their flocks and herds."

Making allowance for the absurd exaggerations in this account, and the easy manner with which the travelers were deceived and imposed upon, it is interesting to know how completely the idea of oxen or buffalo is mixed up with the territory over which Coronado marched. One thing is certain. The original inhabitants met with did not differ very materially from the red man of to-day. The reference to drinking the blood of the oxen hot is merely a forecast of the practice which has prevailed since the United States Government has fostered idleness among the Indians, by serving them out live rations of food. The writer of this chapter remembers witnessing a few years ago the distribution of live beef to the Indians in the vicinity of Fort Reno, on the extreme western boundary of Oklahoma proper. Hundreds of our readers have doubtless seen a similar scene, but when witnessed for the first time one can naturally appreciate the sentiments of Coronado when he recorded the hot blood drinking of the aboriginal inhabitants of the great plains of the Southwest. On the special occasion referred to, as on similar ones, one beast was given out as rations to a certain number of families or individuals, and the idea was that reasonably fat steers should be used for the purpose. The contractor had, however, succeeded in gathering together about as mean an aggregation of lean and aged cows as could well be thought of, and these were turned loose at the mercy of the men the Government is supposed to be civilizing.

Amid a scene of shouting and general excitement, a number of braves mounted their bare-back ponies and went through all the motions of buffalo hunting, with the ancient cows taking the place of the now exterminated, but once monarchial, hump-back animals of the plains. Beasts were cut out, driven in every direction, and worked up into a condition of fury and madness. Finally, one after the other was lassoed, thrown, stabbed and dismembered. The disgusting manner in which portions of each beast were consumed, especially by the women and children, need not be detailed at length.

But to return to the early history of cattle in this country. The Pilgrim Fathers and other pioneers certainly brought with them choice selections from their native herds. Many pictures, still preserved, of the early days of the New World, contain illustrations of cows, and it is clear that these refugees, who were fleeing from oppression in search of liberty, realized from the first what an immense advantage would accrue to them from continuing on a smaller scale the dairy operations which they conducted in the old country. The earliest importations of cattle of which we have any record were to Old Virginia in the first days of the sixteenth century. In the meantime there had been extensive introductions of cattle into the West Indies, and early in the seventeenth century we read of a hundred head of cattle being brought into Virginia.

OLD-TIME COWBOYS ON THE PLAINS.

The Plymouth colony brought with it a number of South of England cattle in the year 1624, and there are some interesting records still in existence at Plymouth, showing that these cattle had greatly increased in number, and were prospering well in the new land.

There were no cattle kings in those days. From the records it appears that "one Henry Hope" had ten cows, and was counted a wealthy man. It is to be presumed that he supplied the early pioneers with milk and butter, and possibly cheese, though this is a detail concerning which history is silent. It does not appear that he fed cattle for slaughter purposes, though we find a reference to the sale of a fat bull calf, the price of which is not clearly stated. According to another interesting old New England record, we find that Dutch as well as English cattle were kept, and there is even a brief, but clear statement, of the advantages of the latter over the former.

From other records it would look as though in the early days of the Plymouth fathers all the cattle were held in common, and that this socialist idea prevailed until about the year 1627, at which period there was a general division of property, and when one received a brindle cow, another a black one, another a red cow, and another a cow of mixed color. It is not clear from the records how many cows were thus divided up, but it is quite evident that there was no very definite idea of the special breed or grade.

Mr. Flint says that the first large importations into New York from Holland were made by the Dutch West India Company in 1625, and he considers that the results of those introductions have been felt up to the present time. At about the same time, or perhaps a little later, ship loads of cattle were brought over from England, and in 1627 the Swedish West India Company landed several ship loads on the Delaware. In 1630 and the two following years a large number of Danish cattle were landed. These, according to Mr. Flint, were mostly large, coarse, and yellow, and inclined to be ungainly in shape. After this, English cattle came in heavily, and by the end of the eighteenth century the importations run up to the thousands. Of the special characteristics of these breeds we shall speak fully in a later chapter.

From that time forward the progress of the cattle industry of the United States has been rapid. Gradually the types of cattle from Northern Europe spread over the country in a westerly and southwesterly direction, until they met the descendants of the cattle brought over from Spain, probably one hundred or one hundred and fifty years sooner. Of the effects of inter-breeding with the different kinds of types we shall speak later, our object in this chapter being merely to speak of the very early history of cattle raising. Mr. Joseph G. McCoy, in his "HISTORIC SKETCH OF THE CATTLE TRADE OF THE WEST AND SOUTHWEST," credits Cortez with the original introduction of cattle from Spain, and pays him the compliment of stating that while he was guilty of many acts of theft, and even worse, he conferred a good and enduring benefit by the introduction of a stock of cattle peculiarly adapted to the climate and people of Mexico and adjoining territory.

Mr. McCoy, in dealing with the early happenings of the cattle trade in Texas and the Southwest, says that the area of the American continent situated east of the Rocky Mountains, that appeared to be especially adapted to the production of live stock, was very great, and embraced the western and larger halves of Texas, the Indian Territory, Kansas, Nebraska, Dakota, all of Wyoming, the eastern half of Colorado, and nearly all of New Mexico, aggregating many hundreds of thousands of square miles and many millions of acres. Texas, being not only the largest but the first one settled, naturally received first attention. "The Gulf of Mexico and the Rio Grande River," he wrote in 1873, "form its southern and southwestern boundaries. The Territory of New Mexico forms its western boundary; Red River is its northern line, and Louisiana bounds it on the east. Its area is over two hundred and thirty-seven thousand square miles, or over one hundred and fifty-two millions of acres, one hundred and fifty millions of which are devoted principally to the production of live stock. From its geographical location in regard to Old Mexico, from whence a supply of live stock for ranching purposes was early obtained, and owing to its excellent climate, being almost destitute of winter weather and its unlimited grazing facilities, Texas first attracted settlers from Mexico, as well as from all parts of the New World. Texas was originally a part of the domain of Mexico, and from that country was at first sparsely stocked up with Spanish cattle, of similar blood and quality to those originally placed in Mexico by Cortez, the conqueror. But a brave and hardy class of white men soon came to the control of political affairs in Texas, and struck for freedom. So self-reliant and daring a race of people as then constituted the white population of Texas could not be conquered or fail to obtain any reasonable object for which they might unitedly make an effort to attain.

"After many bloody struggles, victory perched upon the Independent banner, and the independence of Texas was acknowledged by the mother country. For a few years Texas was an independent republic, but believing that in union there is strength, she cast her lot with the United States, but retained the ownership of her public domain. So that an emigrant locating upon her public lands looks to the State Government for a title instead of the United States, as is the case in other States and Territories. The admission of Texas into the Union was the cause of the Mexican war, the history and results of which are familiar to most readers. The State of Texas is watered and drained by the Rio Grande, Pecos, Colorado, Brazos, Trinity and Red Rivers; the eastern portion is heavily timbered with immense forests of pitch or hard pine; the central portion of the State is more diversified with prairie and timber, and its soil and climate conspire to make it the very best agricultural country; the western portion of Texas, and by far the largest half, is as well adapted to stock raising as any portion of the globe, and, like any other portion that is well adapted to that business, it is fit for little else than stock raising.

"For a distance of fully five hundred miles east of the Rocky Mountains, the grass is different in character and appearance to the grasses found in the balance of the Mississippi Valley. It is a fine, soft, velvety species, seldom growing over three or four inches long, and has a mild, sky-bluish, green color. It is familiarly known as buffalo grass. It usually attains its full growth in the spring months, during the rainy season, and when the dry, heated months of summer approach, it cures or dries up, but retains all the nutritious qualities originally possessed. In fact, many stockmen regard it as superior feed, making more fat or tallow when it has attained its growth, and is cured by the sun's hot rays, than when it is in process of growing, and is fresh and green. Western Texas is covered with a species of grass nearly akin to the buffalo grass, one of which is called grammad grass; also, another variety is called mesquite grass. Both varieties cure up in summer and constitute excellent food for stock during

the winter. It is too short of growth to make much of a fire. In fact, a person unaccustomed to it, would be loath to think that there was so much as bare sustenance in it, much less good living and thick tallow. There are several varieties of mesquite grass, one of which is noted for its disposition to run over the ground, much like a miniature watermelon vine. It is considered the best grass that grows in Texas. From sections of that State where the vining mesquite abounds come the heaviest and fattest Texan cattle, and, in the mesquite regions, the cattle grow larger than in any other portion of Texas."

Mr. William Kuykendall, writing in the Texas STOCKMAN AND FARMER, gives a very entertaining narrative as to the first transactions in cattle in Texas, and, by permission of the publishers, we reproduce a section of his review. Mr. Kuykendall commences by calling attention to the difficulties to be encountered by the man who endeavors to write a history of Texas cattle. Our sympathies are heartily accorded him, for it is doubtful whether any industry in the United States contains less in the way of reliable records to which access can be had as the great cattle growing interest. Mr. Kuykendall seems to have gotten over the difficulty fairly well, and has given at least some very interesting, although very condensed, details concerning the trade. His record of events between the years 1822 and 1860 suffers only from brevity. It reads as follows:

"Of the early history of the industry, if indeed it could be recognized as such, but little is known, as historians are profoundly silent upon this subject. It is not presumed, however, that the early colonists brought any considerable number of cattle with them to the country, as there was no demand for them save that for domestic purposes, and even this demand was limited to the wants of the pioneers themselves. Yet it is in evidence that some were brought, as I learn from a manuscript of an ancient date now before me that my grandfather, Capt. Abner Kuykendall, who settled on New Year's Creek, within the present limits of Austin County, in January, 1822, brought a few head with him from Arkansas. But as the range was new and unlimited, the natural conditions were favorable to rapid increase. The broad prairies adjacent to the coast, abounding in a great abundance of nutritious grasses, were particularly adapted to the raising of cattle, and it was in this section we find the greatest attention was given to the business, and here, consequently, the first large herds were founded.

"It is a reasonable surmise the foundation stock was principally secured in Louisiana, especially for the upbuilding of herds located east of the Brazos River, while it is a well-established fact the Western section received its foundation stock from Mexico. This original stock was of the ordinary scrub variety common to those sections. In fact, few cattle of the improved breeds had been imported into the United States prior to this date; the first importation of importance having taken place in 1817, and the progeny of this importation was for many years retained in Kentucky and adjoining States. It was not, however, until after the Mexican war that the business assumed sufficient importance to entitle it to special consideration. It was not until the decade beginning in 1850 that the industry received any special stimulus.

"The discovery of gold in California, and the consequent rush of fortune-seekers thither, created an abnormal demand in that Territory for the necessaries of life. The fabulous prices ruling in that district market for beef induced a few enterprising parties to brave the difficulties and dangers incident to a drive of fifteen hundred miles through an almost unknown country to that land of promise. I can recall two herd parties made up in Refugio County destined for that market; one by James Ellison and a gentleman named McKinley, and another by a Mr. Erskine, of Gonzales County.

"About this period, or perhaps a little earlier, James Foster conceived the idea of shipping beef by steamship from Indianola to New Orleans. This enterprise proving a financial success offered the first reliable market for Texas beef. Thomas O'Connor, afterwards known as the 'cow king of Southwest Texas,' and my father, sold Mr. Foster one of his first shipments. These cattle were fine specimens of Texas cattle, old, fat, and fully developed. They received the sum of ten dollars per head for them and were elated over the excellent sale they had made. For many years thereafter Foster virtually monopolized the beef trade of Texas.

"Under the stimulus of this trade price gradually arose to sixteen dollars per head for choice cattle. But as nothing but prime cattle, fully matured, would meet the demand, it necessarily followed that a large surplus of an inferior grade was left over from year to year. There being no demand for she cattle, all were consequently retained for breeding purposes, and the increase in number was very

rapid, thereby rendering the supply greatly in excess of the demand. This unhealthy economic condition demanded access to more extended markets, hence as early as 1856 a movement was inaugurated to reach the Western markets, which in later years were destined to exercise such a salutary influence upon the industry.

"This brings us down to the beginning of the Civil War. At this period of our history we find our coast country from the Sabine to the Nueces, and even beyond, fully stocked and the accessible markets insufficient to meet the continually increasing supply. Another important element in the business was observant at this time: the old ranges were becoming overstocked, and in consequence the death rate during unfavorable seasons had begun to attract attention. The great excitement that prevailed throughout the country incident to the beginning of hostilities, prostrated business of every character, and all men able to bear arms were called to the defense of the country, and their business interests left to the care of their wives and children."

Mr. Kuykendall's remarks are introduced at this point rather in the form of an introduction or summary than otherwise, and we must go back considerably in point of time in order to make our narrative complete and to see through what tribulation and jeopardy the early ranchman passed. Mr. McCoy has really given us the most authentic records of the very earliest work on the Texas ranches. We need not here go into the question of which was really the first transaction in Texas cattle. Early in the century, and, indeed, fifty years ago, such an immense portion of the State of Texas and of the Territories adjoining it consisted of open prairie, scarcely explored, that no one can be certain as to facts and figures in the first opening of the cattle business.

But we know that once established in Texas the cattle industry began to grow at first steadily and then rapidly. The great difficulty that had to be met with was the finding of suitable markets. A considerable number of fat cattle were disposed of at New Orleans and shipped from that point by water. Gradually, however, attempts began to be made to drive cattle North, and the great Santa Fe trail began to come into prominence and to be crowded at various times in the year with cattle on the march. Col. Inman's "STORIES OF THE SANTA FE TRAIL" give us some idea of the difficulties that had to be contended with when this great highway was of necessity in common use by the cattlemen.

One of his sketches tells us of a terrible ten-mile ride which took place during one of the Indian wars, upward of thirty years ago. As he expresses it so accurately, "the empire of the plow had not then dawned nor had the march of the homesteader begun. The 'iron trail' was a possibility, but he was a visionist who argued its probability."

The commerce of the great plains over that broad path through the wilderness, the Santa Fe trail, was at its height, and immense trains rode day after day toward the Blue Hills which guarded the portals of New Mexico. Oxen, mules, and sometimes horses, tugged wearily, week after week, through the monotony of their long journey, their precious freight ever tempting the wily nomads to plunder, dissimulation and murder. Pawnee Rock, Walnut, Coon, Ash and Cow Creeks were mute witnesses of a score or more battles that reddened the blossomed prairie in spring time, and the grass of the Pawnee, Heath's Branch and Buckner's were resonant with the yell of the Kiowas and Cheyennes, who, under the pale moonlight, held their hideous saturnalia of butchery. On the far-off Wolf and Beaver Rivers, where later were gathered under the guise of a semi-civilization the remnants of those once powerful tribes, the scattered lodges are decorated with the scalp-locks of many who were tempted to brave the perilous duty of freighters in the time of which Inman wrote.

To protect the trains on their weary route through the "desert," as the whole of this region was then termed, and confidently believed by the world to be, troops were stationed, a mere handful, relatively, at intervals on the "great trail," to escort the freighters and the United States mail over the most exposed and dangerous portions of the route. Many an exciting encounter occurred, and many thrilling incidents, hair-breadth escapes and "moving accidents," belong to the unwritten chapters of the history of those times, the book of which is, in a measure, sealed; for, like the ocean, the Great Plain tells but little of its terrible record, and rarely gives up its dead.

At the time referred to Fort Riley was one of the extreme frontier posts, and was also the scene of countless raids and fights of the most dangerous character. Forts Zarah and Larned, two other forts

whose names will be remembered as long as the Texas and Kansas plains remain, were also on or near the great overland route, and Junction City was, to use the words of Col. Inman, "in reality the limit of civilization in those days, although Abilene, with its solitary log cabin, and Salina, with only two, made great pretentions as the most westerly cities of the plains."

A graphic description of the ride is told of by the historian. It was made by Capt. O. Booth and Lieutenant Hallowell, in advance of a detachment of troops. They were assured that there was no danger, for there hadn't been an Indian in sight for ten days; but, before the two had advanced far, Lieut. Hallowell called attention to the fact that the buffalo were grazing a long distance from the road. As an old campaigner on the plain, he knew that this meant that there were Indians somewhere around, and a good deal of extra care was necessary.

The party had passed Fort Zarah and had advanced some five or six miles on their way, when suddenly Indians were seen to rise from every ravine and depression in sight. The wagon was turned around and the mules started on a run to Zarah, with thirty-four feathered and painted Indians in hot pursuit. The race was one of terrible excitement, and Hallowell, who was driving the wagon, was struck by an arrow behind his right ear. Capt. Booth pulled out the arrow, and the gallant Lieutenant went on driving, although he was again struck and badly hurt. Several shots were fired, and the number of the pursuers was reduced, although the pursued party was suffering terribly. Hallowell was hit a third time, and it was only by leaving the trail and bearing hard to the right that a little breathing time was given to the men, who were in momentary danger of being captured and scalped. The mules were pressed to their utmost, and, as a last resource, small articles of wearing apparel and valises were thrown out of the wagon in order to divert the attention of the pursuers.

While this diversion was going on in the rear, the Indians noted the fact that the main camp was absolutely in sight, and that, unless they adopted more direct tactics, they would lose the mules, which they had set their hearts upon as a prize. One of the Indians was accordingly deputed to lame one of the mules, which he did by sending an arrow into his front limb. The trick was only in part successful, because the uninjured animal was so frightened that it dragged the wagon and its lame mate at a faster speed than ever. Gradually the strength of the animals grew less, but finally the attention of the camp was directed to the chase, "boots and saddles" was sounded, and ninety troopers came to the rescue of the sturdy couple, whose terrible ride was over. Both men were badly injured, and the dangers to which they were subjected gives an idea of the risks which ranchmen, as well as Government officials, encountered in the early history of the plains. As the writer to whom we are indebted for the incidents of this ride puts it, "the occurrence narrated is but one in a thousand. Hundreds terminated more tragically, as the nameless graves that dot the prairie along the Santa Fe trail will most assuredly prove."

The massacre at Babb's Ranch, also narrated by Col. Inman, is but another instance of the tragic adventures encountered in the early days of the history of cattle raising in Texas and the Southwest. Babb's Ranch was situated in the Western frontier land of Texas, near the banks of a small tributary of the Colorado River. Its owner, the man who built the little cabin and who ran the ranch, had to take the trail one summer day for one of the nearest towns in Mexico on business, and left his wife and children behind. The Indians had been quiet for some time, and but little fear was entertained by him in regard to his family in his absence. But he had not been gone a week when his wife saw, early one morning, a number of mounted Comanches coming in the direction of her little home. Her children were playing round the house, and before she could get them together the Indians had ridden up, captured two of them, and tied them firmly together with ropes. Others, running into the house, snatched the baby from its mother's arms and killed it instantly; two other members of the tribe killing the distracted woman instantly. They then seized a relative of the family, a widowed lady, Mrs. L——, and with her and the two children galloped off north.

In his "BORDER REMINISCENCES," Gen. Marcy gives a most sensational and graphic description of the fate which befell Mrs. L——, and of the various adventures which she passed through along the line and close to the Sante Fe Trail. From his description we learn that, in accordance with their usual practice, the Indians traveled as rapidly as their horses could carry them for several days and nights in succession, only making occasional short halts to graze their animals and secure a little sleep.

Day after day they advanced toward the "Staked Plains," crossing the Brazos, Wichita, Red, Canadian and Arkansas Rivers, which were so high that the horses were forced to swim them. The captives were guarded very closely until they were so far from human habitation that escape was impossible. Then the restrictions were slightly relaxed, but the painted brutes notified the captive lady that if she tried to get away she would be immediately killed. Seeing that a fate worse than death was in store for her, Mrs. L—— carefully observed the relative speed and powers of endurance of the ponies, and one dark night while her captors were asleep, she escaped, mounted the best horse, and started in the direction of the north star, believing that this would lead her to the nearest settlement. Having absolutely no knowledge of the country, the risk she took was a terrible one, and in all the immense expanse of prairie before her there was not a single footmark or trace of human life to help her. The inflexible spirit of this heroine, however, did not succumb in the least to the imminent perils of the situation, and she persevered in her work. Taking the sun for her guide in the day and the stars by night, she pressed steadily forward northward, and urged her steed to renewed efforts and continued exertion. It was a contest for life and liberty that she had undertaken, a struggle in which she resolved to triumph or perish in the effort; and still the brave-hearted woman pushed on, until at length her horse began to show signs of exhaustion, and as the shadows of evening began to appear he became so jaded that it was difficult to coax or force him into a trot, and the poor woman began to entertain serious apprehension that he might soon give out altogether and leave her on foot.

At this time she was herself so much wearied and in want of sleep that she would have given all she possessed to have been allowed to dismount and rest; but, unfortunately for her, those practical quadrupeds of the plain, the wolves, advised by their carniverous instincts that she and her exhausted horse might soon fall an easy sacrifice to their voracious appetites, followed upon her track, and came howling in great numbers around her, so that she dared not set her feet on the ground; and her only alternative was to continue urging the poor beast to struggle forward during the dark and gloomy hours of the long night, until at length she became so exhausted that it was only with the utmost effort of her iron will that she was able to preserve her balance upon the horse.

Meantime the ravenous pack of wolves, becoming more and more emboldened and impatient as the speed of her horse relaxed, approaching nearer and nearer, until, with their eyes flashing fire, they snapped savagely at the head of the terrified animal, while at the same time they kept up their hideous concert like the howling of ten thousand fiends from the infernal regions.

Every element in her nature was at this fearful juncture taxed to its greatest tension, and impelled her to concentrate the force of all her remaining energies in urging and coaxing forward the wearied horse, until, finally, he was barely able to reel and struggle along at a slow walk; and when she was about to give up in despair, expecting every moment that the animal would drop down dead under her, the welcome light of day dawned in the eastern horizon, and imparted a more cheerful and encouraging influence over her, and on looking around, to her great joy, there were no wolves in sight. She now, for the first time in about thirty-six hours, dismounted, and knowing that sleep would soon overpower her, and that the horse, if not secured, might escape or wander away, and there being no tree or other object to which he could be fastened, she, with great presence of mind, tied one end of the long lariat to his neck and with the other end round her waist, dropped down on the ground into a deep sleep, while the famished horse cropped the herbage around her. She was unconscious as to the duration of her slumber, but it must have been protracted to have compensated the demands of nature for the exhaustion induced by her prodigous ride. The sleep was sweet, and she dreamed of happiness and home, losing all consciousness of her actual situation, until she was startled and aroused by the pattering sound of horses' feet beating the earth on every side. Springing to her feet, in the greatest possible alarm, she found herself surrounded by a large band of savages, who commenced dancing around, flaunting their war clubs in frightful proximity to her head, while giving utterances to the most diabolical shouts of exultation.

Her exceedingly weak and debilitated condition at this time, resulting from long abstinence from food and unprecedented mental and physical trials, had wrought upon her nervous system to such an extent that she imagined the moment of her death had arrived, and fainted. The Indians then approached, and after she had recovered placed her again upon a horse and rode away with her to their

camp, which, fortunately, was not far distant. They then turned their prisoner over to the squaws, who gave her food and put her to bed; but it was several days before she was sufficiently able to walk about the camp. She learned that her last captors belonged to Lone Wolf's band of Kiowas.

Although these Indians treated her with more kindness than the Comanches had done, yet she did not for an instant entertain the thought that they would voluntarily release her from bondage; neither had she the remotest conception of her present locality, or of the direction or distance to any white settlement. But she had no idea of remaining a slave for life, and resolved to make her escape the first practicable moment that offered.

During the time that she remained with these Indians a party of men went away to the north, and were absent six days, bringing with them on their return some ears of green corn. She knew the prairie tribes never planted a seed of any description, and was, therefore, confident it was not over three days' journey distant to a white settlement, which the party had evidently visited.

EVENING MEAL ON THE TRAIL.

This was an encouraging intelligence to her, and she waited the time anxiously when she could depart. Late one night, after all had become hushed throughout the camp and everything seemed auspicious for the consummation of her purposes, she stole carefully away from the bed, crept softly out to the herd of horses, and, after having caught and subdued one, was in the act of mounting when a number of dogs rushed out after her, and by their barking created such a disturbance among the Indians that she was forced for the time to forego her designs and crawl hastily back to her lodge. On a subsequent occasion, however, fortune favored her. She secured an excellent horse, and rode away in the direction from which she had observed the Indians returning to the camp with green corn. Under the certain guidance of the sun and stars, she was enabled to pursue a direct bearing; and after three consecutive days of rapid riding, anxiety and fatigue, she arrived upon the border of a large river, flowing directly across her track. The stream was swollen to the tops of its banks, the water coursed like a torrent through its channels, and she feared the horse might not be able to stem the powerful current. But after surmounting the numerous perils and hardships she had already encountered, the

dauntless woman was not to be turned aside from her inflexible purpose by this formidable obstacle, and she instantly dashed on into the foaming torrent, and by dint of encouragement and punishment, forced her horse through the stream and landed safely upon the opposite bank.

After giving her horse a few moments' rest she again set forward, and had ridden but a short distance, when, to her inexpressible astonishment and delight, she struck a broad and well-beaten wagon road, the first and only evidence or trace of civilization she had seen since leaving her home in Texas.

Up to this joyful moment the indomitable inflexibility of purpose of our heroine had not faltered for an instant; neither had she suffered the slightest despondency, in view of the terrible array of disheartening circumstances that had continually confronted her; but when she realized the hopeful prospect before her of a speedy escape from the reach of her barbarous captors, and a reasonable certainty of an early union with people of her own sympathizing race, the feminine element of her nature preponderated, her stoical fortitude yielded to the delightful anticipation; and her joy was intensified and confirmed by seeing a long train of wagons approaching over the distant prairie. The spectacle overwhelmed her with ecstacy, and she wept tears of joy while offering up sincere and heart-felt thanks to the Almighty for delivering her from a bondage more dreadful than death.

She then proceeded on until she met the wagons in charge of Robert Bent, whom she entreated to give her food instantly, as she was in a state bordering upon absolute starvation. He kindly complied with her request, and after the cravings of her appetite had been satisfied, she desired to gratify his curiosity, which had not been a little excited at the unusual exhibition of a beautiful white woman appearing alone in that wild country, riding upon an Indian saddle, with no covering on her head save her long, natural hair, which was hanging loosely and disorderly about her shoulders, while her attire was sadly in need of repairs. Accordingly, he inquired of her where she lived, to which she replied in Texas. Mr. Bent gave an incredulous shake of his head at this response, remarking at the same time that he thought she must be mistaken, as Texas happened to be situated some five or six hundred miles distant. She reiterated the assurance of her statement, and described to him briefly the leading incidents attending her capture and escape, but still he was inclined to doubt, believing she might possibly be insane.

He informed her that the river she had just crossed was the Arkansas, and that she was then on the old Santa Fe trail, about fifteen miles west of Big Turkey Creek, where she would find the most remote frontier house. Then, after thanking him for his kindness, she bade him adieu, and started away in a walk toward the settlements, while he continued his journey in the opposite direction, but he still followed the exit of the remarkable apparition with his eyes, until she was several hundred yards distant, when she disappeared from view. Subsequently this lady married a Council Groves man, and it is to be hoped lived happily afterward.

Another story illustrating the many dangers encountered by ranchmen, even in comparatively recent times, relates to an Indian raid which took place during the month of September, 1868. That the country was in a troublous condition can be learned from the fact that the raid was made on a wagon train, in broad daylight, at a point about one hundred miles from Wallace. When the news reached Fort Harker, Gen. Forsyth started out to intercept the savages on their retreat. The next morning the scouts struck the fresh trail of the Indians, and by forced marches came so close to them that they compelled them to split into small detachments, and night coming rapidly on their trail was lost. But the march was continued north, and on the eighth day, as the scouts were approaching the bluffs of the Republican River, an immense trail was struck leading north. The signs indicated the presence of Indians in large numbers. As it was growing dark, and rather than take the chances of losing the trail in the night, it was determined to bivouac in the vicinity, rest the animals, and continue the pursuit at first streak of day. This proved most fortunate, as the spot selected for the bivouac had some slight strategic value, and was, for that reason, chosen. It was an elongated low mound of sand (such as are seen at intervals in the Arkansas Valley), which with a fork of the Republican at this point formed an island. In the early gray of the next morning, while the stars were still twinkling and sleep oppresses more than at any other hour, the sentinels on the hills above the island yelled "Indians!"

"In a moment," writes Col. Inman, "the camp was awake, and, with rifle in hand, each scout rushed for the lariat to which his horse was picketed, knowing, of course, that the first efforts of the Indians would be to stampede the horses. A small party of the savages dashed in with a horrid whoop, and, shaking their buffalo robes, succeeded in running off a portion of the pack mules and one or two of the horses. A few shots fired by the most advanced of the scouts scattered the Indians, and quiet reigned for a few moments. But before the scouts had finished saddling their horses Indians appeared from all quarters. Over the hills from the west and north, along the river on the opposite bank, everywhere and in every direction, they made their appearance. Finely mounted, in full war paint, their long scalp-locks braided with eagle's feathers, and with all the paraphernalia of a barbarous war party, with wild and exultant shouts, on they came. It was a desperate-looking preponderance of brute force and savage subtlety against the coolness and calm judgment of the disciplined soldier; but Gen. Forsyth, without glancing at the hell in front, with only the lines of determination in his face a little more marked, and grasping the terrible picture before him, stoically determined to take possession of the sand mound with their horses, and then, almost against hope, to accept the gage of battle.

"Fortunately, on the island there were growing some stunted shrubs, to which the animals were fastened, their bodies forming a cordon, inside of which the luckless scouts prepared for the demoniacal charge which they knew must come, with its terrible uncertainty, in a few moments. They had scarcely secured their horses before on came the savages like a shock of whirlwind, and the awful unequal battle commenced. It was not yet daylight, and the Indians, taking advantage of the uncertain light, dismounted from their ponies, and creeping to within easy range poured in a murderous fire upon the scouts. They were splendidly armed, as usual, by the munificence of the Government, or its apathy in preventing renegade white men or traders from supplying them. The Indians, apparently as numerous as the sand grains of their little fortification, hemmed them in on all sides. More than a thousand hideously painted, screaming warriors surrounded this little band, with all the hatred of their race depicted on their fiendish countenances, in anticipation of the victory which seemed so certain. Scattered among these, out of rifle range, were the squaws and children of the aggregated bands, watching with gloating eyes the progress of the battle, while the hills re-echoed their diabolical death-chant, and the howling of the medicine men and chiefs inspiring the young warriors to deeds of daring. The General and his men took in their chances at a glance, but saw little hope in the prospect, yet determined, however, never to be taken alive—a thousand deaths by the bullet were preferable to that—and they made up their minds to fight to the bitter end, which would only come when the ammunition was exhausted or themselves killed.

"To this purpose they commenced to intrench as best they could, by scraping holes in the sand with the only implements at their command—their knives. They succeeded in making a sort of rifle-pit of their position, but before the work was completed two of the scouts were killed and many wounded, among the latter the General. Owing to the dreadful firing of the Indians, who continuously charged down upon the 'island,' the doctor was compelled to abandon his care of the wounded and become a combatant, and he did excellent work with his rifle. But a bullet soon pierced his brain, and he, too, fell among the slain. In a few seconds after the doctor's death, in the midst of a terrible onset by the Indians, the General was again struck near the ankle, the ball perforating the bone as perfectly as done with an augur. The firing of the scouts had not, all this time, been without telling effect upon the Indians; many a painted warrior had bitten the dust before the sun was two hours high. At each successive charge of the redskins the scouts, cool, careful and deliberate, took aim, and when their rifles were discharged each put a savage *hors de combat*. There was no ammunition wasted. Nor had the besieged escaped from the fearful onset of their enemies; besides the casualties related, nearly all the horses had been killed—in fact, before noon all but one had fallen; it is related that when he, too, was killed one of the warriors said, 'There goes the last horse, anyway.' At this juncture, too, with all their horses killed, and half the number of scouts dead or wounded, the Indians determined upon one grand charge which should settle the unequal contest. They rallied all their forces and hazarded their chances upon the aggregate assault. The charging column was composed of some one hundred and fifty 'dog soldiers,' and nearly five hundred more of the Brules, Cheyennes and Arrapahoes, all under the command of the celebrated chief, 'Roman Nose.'

"Superbly mounted, almost naked, in full war dress, and painted in the most hideous manner, formed with a front of about sixty men, they presented a most warlike appearance. They awaited the signal of their chief to charge with the greatest confidence. He at first signaled to the dismounted men beyond his line of horsemen to fire into the scouts, and thus make his contemplative charge more effective. At the moment of the fusillade, seeing that their little garrison was stunned by the fire of the dismounted Indians, and rightly judging that now, if ever, was the proper time to charge, 'Roman Nose' and his mounted warriors, with a wild, ringing war-whoop, echoed by the women and children on the hills, swept onward. On they came, presenting, even to the brave men who awaited them, a most superb sight. Soon they were within range of the rifles of their friends, and the dismounted Indians slackened their fire for fear of killing their warriors. This was the opportunity for the scouts. 'Now,' shouted Forsyth, and the scouts, springing to their knees, and casting their eyes coolly along the barrels of their rifles, opened upon the advancing savages with a deadly fire. Unchecked, undaunted, on dashed the warriors; steadily rang out the reports of the frontiersmen. 'Roman Nose' falls dead from his horse, 'Medicine Man' is killed, and for an instant the column, now within ten feet of the scouts, hesitates, falters. A cheer from the scouts, who preceive the effect of their well-directed fire, and the Indians begin to break and scatter in every direction, unwilling to rush to a hand-to-hand struggle. A few more shots and the Indians are forced back beyond range. Forsyth inquires anxiously, 'Can they do better than that, Grover?' 'I have been on the plains, General, since a boy, and never saw such a charge before.' 'All right, then, we are good for them.' It was in this grand charge, led in person by their greatest of all warriors, 'Roman Nose,' that Lieutenant Beecher was mortally wounded. He suffered intensely, and lingered some hours before his manly spirit was extinguished. He was brave, the very soul of honor, and a favorite in all the garrisons. It is a burning shame that such as he are so frequently offered up on the altar of a barbarous policy, dictated by a great Government, that should be honest enough with its wards to preclude the possibility of such outbreaks as our so-called Indian wars. Before night closed in on the terrible tragedy of that day the Indians charged upon the beleagured scouts again and again, but were as often driven back by the dreadful accuracy of the rifles of the besieged with an increasing loss each time. The earnestly looked-for darkness at last brought the welcome respite, and it was made possible for the unfortunate men to steal a few minutes rest that was needed, Oh, how much! Hungry, exhausted, with an empty commissariat, every animal dead, four comrades lying stark upon the dreary sand, and a greater number writhing in all the agony of torturing wounds; a relentless enemy ever watching; no skilled hand to alleviate the sufferings of the dying, and the only hope of help, that might never come, more than a hundred miles away.

"'Think of it, grasp it if you can,' writes Col. Inman, his indignation growing apace. 'Later, while the night yet thickened, preparations were made to meet the events that must surely come with the morning's light, and the little fort—for it now had certainly reached the dignity of that title—was made still stronger; for rations, the swollen carcasses of the dead horses were used, and huge slices were cut from their thighs for food. Thank God! the torture of thirst was not added to their other sufferings, for water was easily obtained by digging a short distance. Thus strengthened, a midnight council of war was held in whispers, and it was determined two of their number should go to Fort Wallace, as desperate as the undertaking was, and a mere boy—Stilwell—and another scout expressed their willingness to make the attempt.

"The brave men crawled from the island to run the gauntlet of the watchful savages, ever on the alert to take advantage of the least unfavorable demonstration on the part of their prey, as they fully believed them. The sun rose in all the splendor of a Kansas autumn morning. All through the weary hours the Indians kept up an incessant firing, but no serious charge was attempted—they had more than they anticipated in their efforts in that direction—so the scouts, pretty effectually intrenched, suffered but little from the mild firing of the besiegers, but it was annoying, and kept them ever prepared for a possible charge, the result of which might not be so fortunate as that of former ones.

"Night again came to throw its mantle of rest upon the band, and two more scouts were sent out to reach Fort Wallace, if possible, but failed to get beyond the line of watchful savages, and were compelled to abandon the idea. This unsuccessful effort to go for help cast a gloom over the command, for it could not yet be known what had been the fate of the other two who had gone out the night

before. The next day the state of affairs assumed a more cheerful aspect, if that could be possible; the squaws and children had disappeared, which indicated a retreat upon the part of the Indians, although they still kept up their firing at intervals—perhaps they, too, were getting short of ammunition and provisions. In the afternoon they hoisted a white flag upon a pole and expressed a desire to talk, but our heroes were too wary to be caught with such chaff as that, for with Indians a flag of truce means a massacre half the time. That night two more men were sent out, and those carried that famous dispatch of Forsyth's, which should hold its place in history with that memorable one of Grant's: 'I intend to fight it out on this line if it takes all summer.'

"It read: 'I am on a little island and have still plenty of ammunition left. We are living on mule and horse meat, and are entirely out of rations. If it were not for so many wounded I would come on and take the chance of whipping them, if attacked. They are evidently sick of their bargain. I can hold out for six days longer if absolutely necessary, but please lose no time.' The morning of the fourth day, on the now historical little island, broke more cheerful still; the Indians could be seen rapidly moving away, only a few, comparatively, remaining in sight, to await until entire exhaustion and starvation should place the scouts in their power; but they little knew the metal of the men lying behind those breastworks of rotten horses, or they, too, would have gone with the old men, women and children of the tribe. But few shots were fired by the scouts in response to the occasional random fusillade of the Indians, they contenting themselves with saving their ammunition for a possible last grand act in the drama, and only shooting when an Indian came within certain range, and then he was sure to be sent to the 'happy hunting grounds.'

"Night again came with its relative rest, and then another weary day of watching and waiting, without any special demonstration on the part of the Indians. But new horrors made their appearance in the shape of gangrene wounds, and suffering for want of food. The putrid flesh of the dead horses and mules was all that remained that would support life, and however revolting, it had to be swallowed. The nauseating effluvia of the rapidly decaying dead carcasses made the place almost intolerable, and so insufferable did it become that the General told those who were disheartened to go, but all to a man, to their honor be it recorded, refused, electing to remain with their companions in arms, to be rescued or to die with them. Two more days of torture, and then, on the ridge between them and the golden sunlight, gleamed the golden bayonets of Col. Carpenter and his column, or 'the boys in blue.' Their Havelock had reached this American Lucknow, and cheer after cheer, feeble though they were, went up from the little island."

CHAPTER III.

Influences of Barb Wire and the Civil War on the Cattle Industry of the Southwest.

IN the preceding chapter we dealt with some of the difficulties which had to be overcome by the cattle raiser of a generation or two ago. In that chapter reference was not made so much to the difficulties of raising cattle on the plains of Texas and the Southwest, in the early days of the industry, as to the difficulty of living on those plains at all. In other words, more stress was laid on the care necessary to preserve life in the ranchman than in the cattle which he owned.

It will now become necessary to deal more with the animal, and less with the man.

In doing this we are beset with great difficulty on account of the absence of authentic reference. The only man who seems to have systematically collected data relating to this important period in cattle history is Mr. Joseph G. McCoy. From him we learn of the immense difficulties encountered in ante-bellum periods, and from his work we also glean much that is interesting and amusing concerning the cattle trade. Beginning with the investment of a few dollars, or the trading of a few negroes for small bunches of cattle, the trade generally grew, and by the time the war broke out it had assumed proportions of considerable magnitude. The war, as we shall see later, created a condition of affairs which reduced cattle stealing to a fine art, and also led to the coining of the expression or proverb that all that was necessary to stock a ranch was to secure a branding iron and have nerve enough to use it.

Long before the war a variety of complications cropped up. Free grass was the rule, and the men who went to Texas along the old Sante Fe trail, in advance of railroads and general civilization, had at least the benefit of what Mr. W. S. James describes as, "the good old days of free range, when the grass was as free as the air they breathed and when the 'Wo hau come' of the horny-handed son of the granger was never heard in the sacred precincts of the land of free grass and water." There were no barbed wire fences in those days, nor were there any roads to amount to anything. The ranchman drove his stock to market, when he could find one, by easy stages of something like ten miles a day along a more or less plainly defined trail, the animals feeding on the rich grass as they went and losing little from shrinkage.

Driving on a large scale is now impossible on account of the superabundance of fences, and the practical impossibility of securing grass and water *en route*. It would look at first sight as though the ranchman was worse off to-day than he was thirty or fifty years ago, but it is not by any means sure that he is. In the days of which we are speaking wolves and panthers took the place of more modern drawbacks to prosperous ranch enterprise; and although the man who turned his bunch of steers loose on the prairie was monarch of all he surveyed, his right was liable to be disputed at any moment by a band of Indians, who were experts at stampeding cattle as well as horses, and who, without notice, would frequently deprive a man at one fell swoop of the profits of perhaps a score of years' hard and incessant labor.

One thing the cattleman of old enjoyed, and that was elbow-room. The settler who located a homestead and fenced it in was regarded as an intruder, though the objection to him was insignificant compared to the hostility which was naturally felt toward foreign corporations which fenced in immense tracts of land and sometimes all the available water supply within reasonable driving distance. With the advent of the barbed wire came the shears and the illegal cutting of strands. Many lives were lost as a result of this illegal work, and one of the most arduous tasks ever given to cowboys was the riding along the lines and watching out for fence-cutters. It frequently happened that an entire colony of small cattlemen and farmers would combine against an intruder who had fenced in thousands of acres, as well as every possible watering place for stock within driving distance. A secret society was often

formed under these conditions, and just as the Nihilists of Russia cast lots as to who shall be called upon to "remove" a tyrant or oppressor, so were lots cast, or coins tossed, to decide who would cut certain fences on a certain night.

The person to whom the task was allotted was only too willing to execute the trust, and although he might have to wait hours in succession for an opportunity, he generally succeeded in fulfilling his task, and in breaking down the hitherto impregnable fence surrounding an objectionable enclosure or shutting off an indispensable stream or spring. Night after night this would be repeated in spite of the vigilance of watchers, and as an entire neighborhood would be involved in the crime, it was very difficult to secure conviction even when the evidence was overwhelming. Many romances have been written in regard to wire-cutting, but it is unnecessary to reproduce many of them here. One story, however, told the writer by a man now employed in the Chicago stock yards, is worth reproducing as an illustration.

The incident took place during the excitement and general in-rush of people of all sorts and conditions, bent upon establishing large ranches, and fully convinced that there were fortunes to be made out of the work. There arrived one day in one of the southwestern counties of Texas a strictly foreign outfit. It was backed by British capital, and run by recent importations from the old country. The velveteen jackets, corduroy trousers and costly tanned leggings worn by the new comers were almost as aggravating to the old settlers as the proverbial red flag to the equally proverbial dyspeptic old bull. The "Britishers," as the new ranch people were called, added to the natural repugnance felt toward them, in consequence of their haughty demeanor, by acts which spelled "ruin" to the small settlers and cattlemen who had previously been allowed to live in the neighborhood. Barb wire was imported by the car load, and every settler who had the slightest flaw in his title found himself dispossessed of his home, while those who were taking advantage of free grass and raising small bunches of cattle were driven off the range by force of numbers.

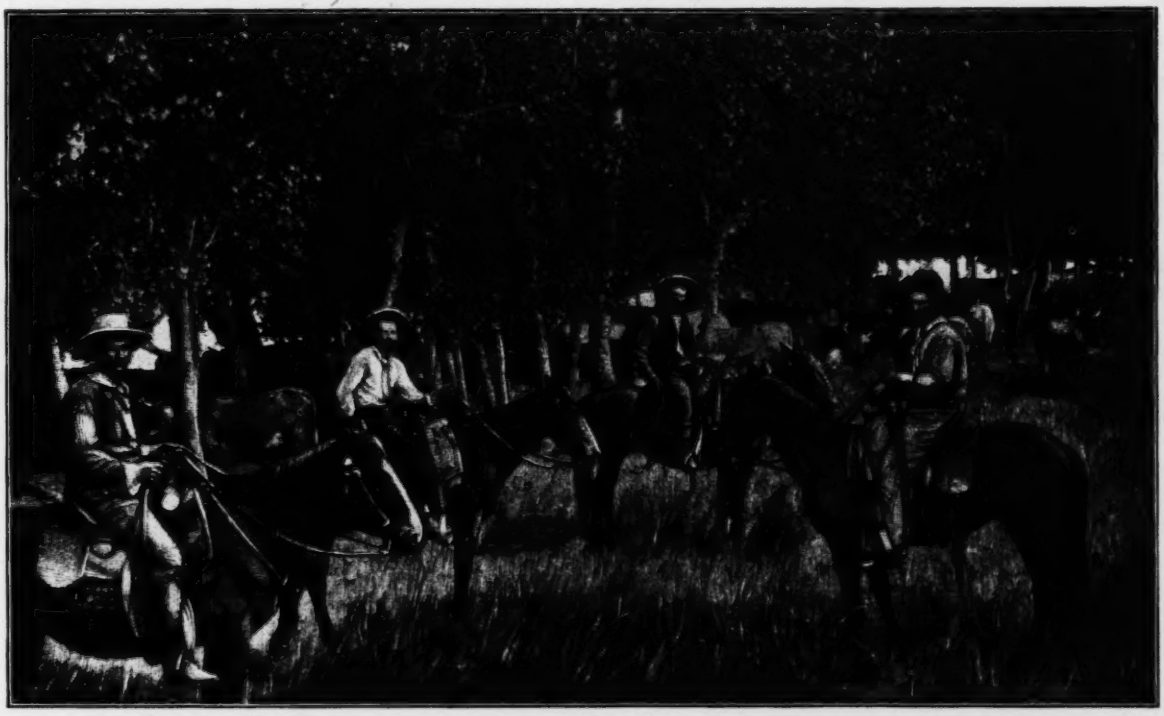
Cattle were bought recklessly and some of those who were practically ruined by the aggression, legal and otherwise, of the foreigners, got even with the new-comers by selling them bunches of cattle at three or four times their actual value. Others, however, were made of sterner stuff, and with those who had homes and children to defend, held aloof and made common cause against the intruders. Councils of war were held night after night, and very soon the British cattlemen found that as fast as they could stretch their barb wire during the day, so fast were their strands divided and wrecked during the night. There was no declaration of war, but hostilities soon began to be open, and finally the wealthy new-comers decided to put a stop to the interruptions by a concerted movement. Massing all their strength and securing the assistance of one or two local men who were not in sympathy with the settlers, or who had been bought, personally as well as otherwise, they laid wait for the fence cutters, and on one very dark night succeeded in capturing eight men red-handed.

The prisoners were taken to the ranch in high glee, and deliberation commenced as to what course should be taken with regard to them. It was noticed that two of the exquisite velvet-coated gentlemen were absent, and the deliberations were interfered with by reflections as to whether these typical tenderfeet had got lost. It soon transpired that another fate had befallen them, and that they had been captured by a section of the fence cutters during the affray. The two men were held as hostages for an entire day, and the offer was finally made to release the fence cutters if the two Britishers were let loose unharmed. The original inhabitants had no intention from the first of harming the exquisites, although they took a perhaps unfair delight in watching them try to eat corn bread and pork, and to appear jolly under circumstances which were the reverse of congenial. A kind of peace was patched up, but the result was not very satisfactory, and the difficulty was never really got over until the usual fate befell the foreigners, and they returned to their own native land, plus a great deal of experience but minus a great deal of money.

Of course, no one defends for a moment fence cutting under any circumstances. The average cattleman is a law-abiding citizen, and all the best cattle associations from time to time have used their influence to check and, as far as possible, stamp out the practice. Indeed, the better class of cattlemen have preferred to have farms properly fenced in rather than to have claims constantly brought forward in consequence of stock straying into growing crops and otherwise doing damage. The State law on

the subject of fence cutting is very clear and has been so for many years. It is now enacted that any person who willfully cuts a fence or part of a fence, which is not his own, shall be sent to the Penitentiary for not less than one nor more than five years. A fence is defined as any structure of wood, wire, or both, or of any material intended to prevent the passage of cattle, horses, mules, asses, sheep, goats or hogs. The law as to definitions of fences has not always been so clear, but it is now enacted that every gardener, farmer or planter shall make a sufficient fence about his cleared land and cultivation at least five feet high, and that the owner of cattle straying shall not be held liable for damage when it can be proved that the fence was insufficient or unreliable.

We are anticipating, somewhat, by giving these enactments at this point, but we do so because it is difficult to explain the situation otherwise. The State law has recognized that rights of way must be kept open, and that wholesale fencing in cannot be permitted in violation of existing rights and needs. It is specially enacted by the Texas Legislature, with similar laws in adjoining Territories, that it is



A SHADY RETREAT.

unlawful to build or maintain more than three miles of lineal measure of fence running in the same general direction without a gateway, which gateway must be at least eight feet wide and be kept unlocked. A fine of a hundred dollars a day is imposed upon parties maintaining abnormally long lines of fences in contravention of this statute. Had the law been passed earlier in Texas history, an immense amount of hardship would have been prevented, and many of the stories of conflict between new-comers and old would never have been given any ground for narration.

One great objection, and, indeed, bugbear of the original cattleman of Texas, was his horror of being crowded. This characteristic of pioneer life was not confined to those who depended upon cattle for a livelihood. The man who turns his back upon the comforts of advanced civilization is actuated by a number of motives. Generally, he wishes to secure a home with but little outlay, and to grow up with the country; but the predominating motive with a vast majority of "boomers," or men who rush to the front whenever a new country is opened, is to secure elbow-room. Mr. W. S. James, writing in his somewhat picturesque style, on this peculiar characteristic, says, in his work on cowboy

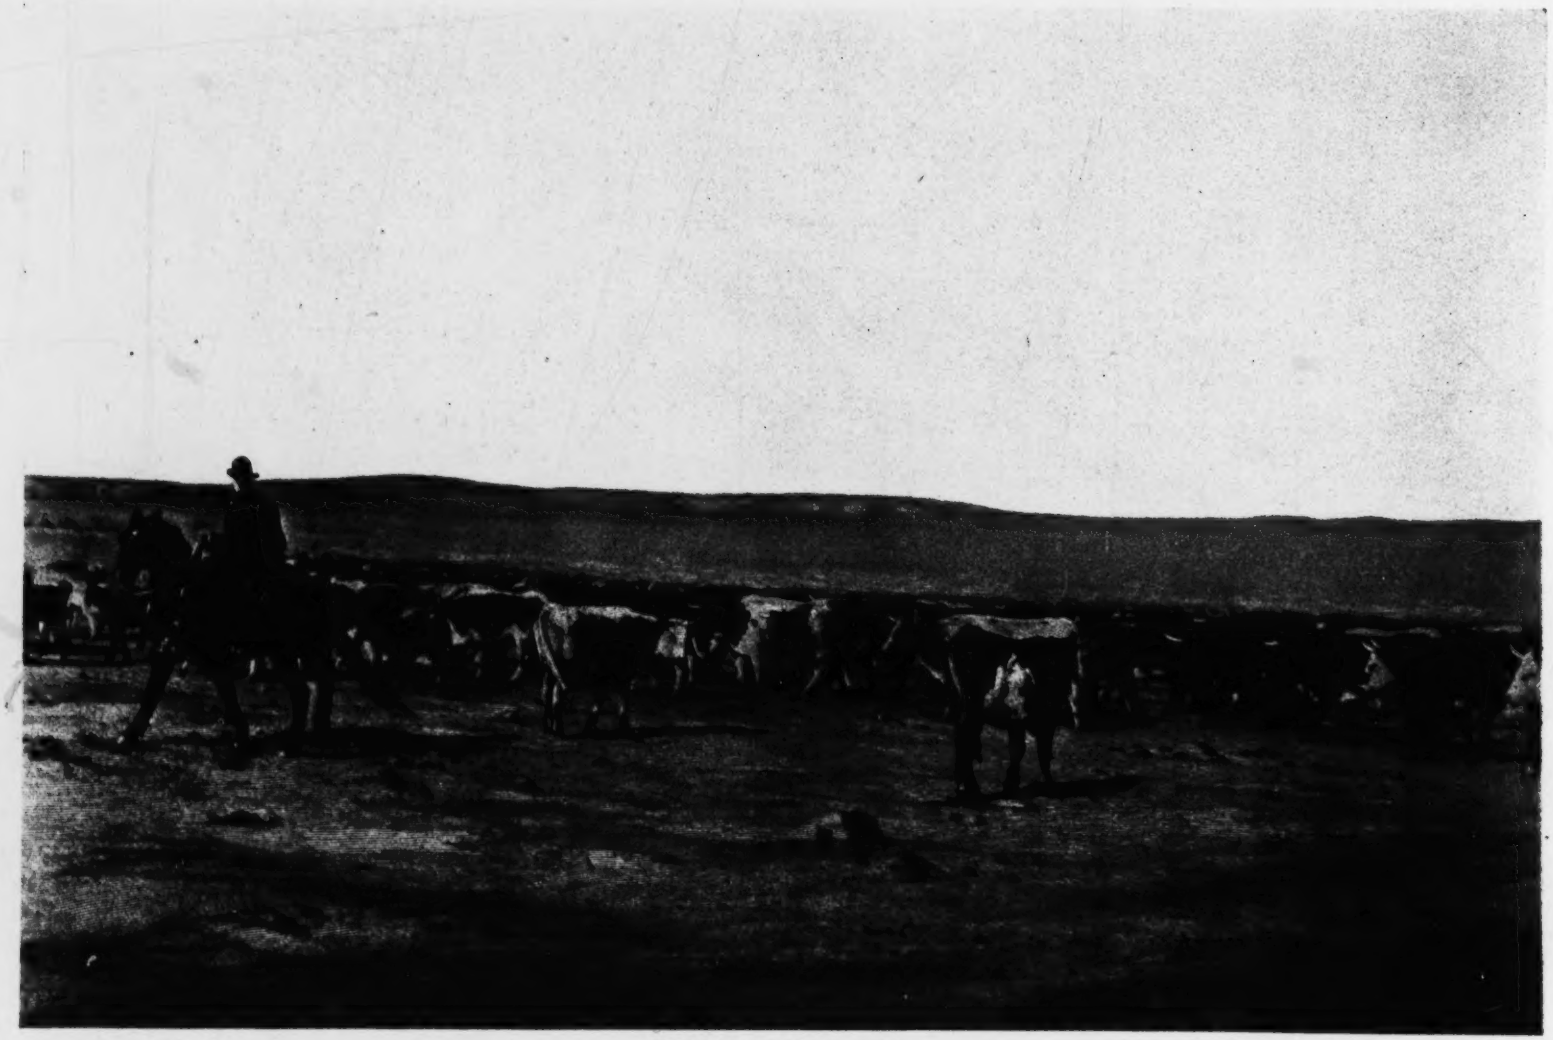
life, that there never was any great contention worth naming among the early cattlemen. "It is true," he says, "they didn't wish to be crowded, and in illustration of their ideas of what that meant I recite a little incident in connection with one of the residenters. He lived out, perhaps, a hundred miles from our little country town, and seventy-five miles from the nearest trading point except the Government post. While down in the settlement with his teams, after bread, my grandfather asked him how he was getting on. 'Very well, very well; thank you, Bill. I've got to move, though.' 'Why?' said grandfather. 'Oh, because they are crowding me out there; the nesters are settlin' all around me, and I will not be crowded. One of the impudent varmints has settled right down in my back yard.'

"Upon closer inquiry we found the location of the obnoxious nester referred to, to be twenty-eight miles below him, on the opposite side of the river. Of course, it was more of a jest than earnest; the real fact, however, is there were none who enjoyed the presence of the nester; he was held in somewhat the same contempt that a physician of the old school looks upon patent medicine men, or the sheepmen would a wolf. The old-time cattlemen looked upon the country as being fit for nothing but pasture, and the man that presumed to squat down and dig his living out of the ground by the sweat of his brow as being in very small business. In fact, they went upon the principle that they had put no grubs in the ground and didn't propose to take any out, as I once heard a cowman say; that 'God had discriminated in favor of the stockman when he had respect unto Abel in his offering, and despised the offering of Cain, consequently the cattlemen had a right to the range.' This gentleman reminds one very much of the theologians of to-day who simply construe God's word to mean that which meets the demands of their own inclination. This is clearly proven by their antagonism of the sheepman of a few years later. Of all despicable characters to the cattlemen, it was the sheepman. They then quoted the passage portraying the churlishness of Naban, and fain would assume the character of an insulted and outraged David, and further would have wiped him off the face of the earth with all his coolies, but for the reconciling influences of the 'Abigail,' though not so graciously polite as the Abigail of old, yet quite as effective, the great strong arm of the law.

"One discrimination this modern Abigail made, however, and that was that the sheepman must keep his stock on his own land, while the 'King of the Kow' was allowed to turn his cattle loose to roam at will. As there is not an event in history without its forerunner or prophecy, so the coming of the sheepman and the attending results was a prophecy of the eventual downfall of the reign of free grass, and if one will stop and think for a moment, as some men did think, it was an inevitable result; the discrimination against the sheepman in favor of the cow-puncher was enough to bring it about. The 'snoozer' was not allowed to herd or turn his sheep loose on the range that he didn't own. The cowman could, with impunity, locate on the line of the sheepman's range; though the 'snoozer' owned his miles of range, the cattle of a dozen ranches were allowed to roam at will on his land. This would naturally drive him to fence. Other sheepmen, seeing the prosperity of one, would come in and buy up large tracts of land, and say to Mr. Cow-puncher, 'Move your ranch.' Then he 'had to,' and, in order to protect himself, he was forced to buy or lease and fence. So the ball began to roll and accumulate until the trouble precipitated between the pasturemen and the free-grass fellows.

"The wealthier class, of course, could buy up larger tracts and lease more land than the little fellow; and when it once began to be a fixed rule for each man to get all he could and keep all he had, the demon of avarice that goes to make up that leaven of so many lives stepped in as the initiator of schemes for swindling, and prompted many men to buy up and lease land on all sides of large bodies of individual property that was not likely for years to be molested, fence all together and thus utilize thousands of acres of land they had no right to. This had the natural tendency to bring out all the rough points of antagonism in the little fellow who was thus cheated out of what he conceived to be his legitimate heritage, and the consequence was that he bought a pair of nippers and went to cutting, or hired some enterprising fellow to do it for him."

There was, at one time, a law passed in favor of the cattleman, allowing one man to take up seven sections of State school land on certain conditions, giving a certain time in which to pay it out. A cattleman of means could take up seven sections, and then have as many of his hands as he wished to take seven sections each, and thus enable one man to control whole counties. This brought about a state of



HEADING OUT FOR THE TRAIL.

THE
JOHN CRERAR
LIBRARY

affairs that culminated in the repeal of that law and the passage of a new one, allowing but one section to each man, and opening all land to actual settlers not leased or legitimately held by former claimants. This resulted in a more relentless war between the big pasturemen and the squatter, or the man with the hoe, than had ever been waged between any two classes in the State, making litigation almost endless, and causing the larger cattle owners to combine, forming cattle companies and syndicates sufficiently powerful to crush out of existence the smaller fry.

"The advent of barbed wire into Texas," Mr. James proceeds, "brought with it a reign of lawlessness and terror such as has no parallel in the State's eventful history. Then there were decidedly two classes, free grass and pasturemen, and never in any land has there been greater bitterness and eternal hatred than existed between those two factions. It was to be heard on the range, at home 'round the fireside, in the courts and in the legislative halls. Every election was carried or lost on this issue, and the best men of the country were on one or the other side of this question. If a man was a pastureman he was favoring the wealthy, if a free-grass man he was branded as a wire-cutter, when in reality neither charge was necessarily true. It is useless for me to enter into the arguments on the two sides of this question, as it has been thoroughly 'cussed and discussed' by writers better qualified than I am to do the subject justice; besides, it is not my object to deal in theory but facts, and this I shall do as far as in me lies.

"The first thing that especially aroused the indignation of the stockman relative to barbed wire was the terrible destruction of stock caused from being torn first on the wire and the screw worm doing the rest. This was especially the case with horses. When the first fences were made the cattle, never having had experience with it, would run full tilt right into it, and many of them got badly hurt; and when one got a scratch sufficient to draw blood the worms would take hold of it. Some man would come into a range, where the stock had regular rounds or beaten ways, and fence up several hundred acres right across the range, and thus endanger thousands of cattle and horses. After the first three years of wire fences, I have seen horses and cattle that you could hardly drive between two posts, and if there was a line of posts running across the prairie, I have seen a bunch of range horses follow the line out to the end and then turn. But, in a few years, the old tough-hided cow found a way to crawl through into a corn field if the wire was not well stretched and the posts close together. The man who had horses cut up and killed by the wire often felt like cutting it down, and in many instances did; but, like every other class of lawlessness, it ran to extremes, and before it had gotten very far was taken up by the more vicious, and such a time one would hardly dream of, who has never had the misfortune to witness it. It became so common that whole pastures would fall in one night, and it made no difference who owned them, the presence of the dread enemy was sufficient evidence, and down she came. The men who cut the wires, with a very few exceptions, were men who owned but a few if any horses or cattle; many of them owned nothing at all; they came out to find room and grass and that class was the most rabid of all others.

"I once met one of those fellows who was working a little East Texas dogy stag and a little bull to an old human wagon (wood axle). He had seven dogs, nine children, a wife, a cob pipe and a roll of home-spun tobacco stuck down in his hip pocket. I mean the tobacco was in his hip pocket—not the family. I asked him where he was from: 'I'am from Arkansaw; Whoa, Bully.' 'Where are you going?' 'Going West, to find room and grass. Ike-lep.' He was a regular copperas-breeches and one-gallus sort of a character, had as soon live as to die, fight one man as two, and would spend more time twisting a rabbit out of a hollow tree than he would to secure a shelter for his family in time of a storm. He could afford to have one or two children blown away, but rabbits were too scarce to take the chance of losing one.

"There would seem to be some excuse for the man who had stock injured by the wire, but for the man who had nothing on earth to lose or gain, who just did it from pure unadulterated cussedness, there can be no mitigation of his crime. Doubtless many good men for the lack of better judgment, on the impulse of the moment, when they came face to face with the evidence of their loss, were led to cut fences, but the cutting of fences made them no better citizens, but had the direct tendency to lead them into other evils. 'Evil communications corrupt good manners.' One starts out down the stream of wrong-doing, and soon he finds its water growing deeper, the cause being that every little rivulet of

evil wends its way on downward to the river of crime, and the man who once allows himself launched upon this dangerous stream is too apt to drift with the tide of evil, until at last he is disrobed of his power to battle with the awful current, and is helplessly swept out into the whirlpool of ruin, irretrievably sinking at last into the ocean of eternity, where he receives his wages.

"The Legislature eventually made it a felony to cut a fence with punishment at 'State contract.' Many men, both good and bad, lost their lives in the conflict and a bitterness engendered of neighbor against neighbor that will tend to chill the blood of good citizenship for years to come. Free grass has gone and nothing to show for its usefulness but the fact that the country was opened and the way made possible for our present development and growth by men who had iron nerve and will to brave the difficulties of a frontier life, all for the benefits offered by free range, and that, that was good. Suffice it to say that the old fellows who came, saw and conquered were not the wire cutters, and, to their credit be it said, almost to a man they condemned it. I mean the old settlers, those men who came in the early days and carved out of the wilderness a home for themselves. Many of the dear old 'diamonds in the rough' have gone to answer the summons of the Great Pioneer of the universe, and those who are still living with us and witnessing the advancement of civilization as a rule are not appropriating to themselves the credit due them for the patient toil and hardships that have given to many a poor man a home in the land of milk and honey, and very few of those who are enjoying the fruits of their labors properly appreciate their real worth, plodding along as they do, their chief occupation gone, often looking with an eye of longing toward the setting sun that so often in early life marked the course of their journey, taking delight in nothing now so much as the privilege of recounting their experiences of more exciting times.

"But some day the eye that was so keen to discover the presence of his inveterate foe, the red man, and draw so fine a bead along the barrel of an old 'human rifle' as to make it extremely unhealthy for the varmint or game that came within range of his trusty piece, that eye will look for the last time upon the accoutrements that were once his trusty companions in the times that tried men's hearts, and then the soul will take its place in the phantom bark that will bear it across the River of Death to the 'better shores of the spirit land,' where there will be no more heartaches, no more Indians to encounter in deadly strife, no more wild beasts to trouble the peacefulness of that home of delight, no more struggles between free-grass advocates and pasturemen.

"Nearly all of the old frontiersmen of my knowledge are soldiers of King Emanuel. Many of those who took part in the struggles recorded have since laid down the sword and taken up the cross; many thoughtless youths who were led into lawlessness are now living in the way which bids fair to render them useful. The great free-grass struggles are over; the people have, as a rule, buried the tomahawk. Barb wire, like the Johnson grass, came to stay, and the people of Texas have decided to make it a blessing instead of wrestling with it. It is bad medicine when a fellow fools with it, and no sadder plight can be imagined than one in which a man is described as being between a mad Texas steer and a good wire fence, the only thing possible for him to do is to drop to the ground and roll under, leaving the steer to interview the fence.

"I shall never forget the first wire fence I ever saw. I took a trip to Fannin County with my grandfather to buy some cow horses. While passing through Tarrant County we stopped near his old ranch on Deer Creek to see about some stock horses of his that ranged near the old place. While here I saw a horse that had been cut across the knee, and we were told that the wire fence we had just passed was the cause. When I saw a barbed wire fence machine at work manufacturing it, and was told that there were thousands of them at the same work, I went home and told the boys that they might just as well put up their cutters, quit splitting rails and use barbed wire instead. I was as confident then as I am to-day that wire would win, and just as confident, when we landed the first trainload of cattle at Fort Worth, Tex., that between barbed wire and railroads the cowboy's days were numbered, as I am now that he is almost a thing of the past."

And while the trade was thus harassed and cut to pieces by debates and fights on the free range and barbed wire question, both ranchmen and their stock were subjected to exceptional dangers from prairie fires. Settlement and cultivation have largely reduced the risk from prairie fires in the great cattle regions of the Southwest, but in the old days this danger was a factor which could not be ignored.

There has always been trouble on account of the reckless and unnecessary burning of grass, and before fire-guards and furrows became common, an entire range country would be sometimes devastated. Frequently immense numbers of cattle were destroyed, and very much larger numbers were driven to desperation and thus led to stampede. Many a cowboy has been cremated on the open prairie, though, as a general rule, the art or science of protecting one's self by means of "back-firing" reduced the loss of human life to a minimum.

Sometimes, in the fall of the year, when the grass was dry and withered, it would be ignited by a chance match or a camp fire, and whole miles of territory would be devastated until something approaching a famine resulted, all means of support over the area being destroyed until the following spring. At times the fire traveled slowly, especially when there was no wind, and on these occasions it was sometimes possible to run furrows, back-fire and check its work of devastation and ruin. When, however, tall rank grass was reached, its speed would be greatly accelerated, and sometimes two advancing arms of fire would join each other in the front, leaving an oasis of safety for the moment, in the midst of which would be collected men, cattle, deer, prairie wolves, sheep, foxes, jack rabbits, snakes and other moving and creeping things innumerable. Gradually the flames would hem in and contract the little haven of refuge until finally the end came. In exceptional instances, it was possible to make a rush onto burned out portions; but it frequently happened that escape was impossible, in which case a wholesale destruction of animal life followed. In the early days of railroads through the prairies of the West and Southwest, scenes of this kind were witnessed more frequently, and sometimes it happened that railroad prospectors followed a line of fire for two or three weeks in succession.

A contributor to one of the leading daily newspapers of the West narrates a soul-stirring incident in connection with a prairie fire which came near putting an end to his existence, in common with other ranchmen, who were traveling along the trail with him. He states that in the distance stray fires were seen, but there seemed to be no immediate cause for fear, and the party camped for the night. There were four of them, and two slept in the wagon, while the other two took blankets and made beds in the grass. One lay a little distance in front of the wagon, and the other as far behind, with the idea that they could scent horse thieves, either white or red, should they make an unwelcome, although not an unlikely, appearance. In the night came the fire. One of the horses fell over one of the sleepers at two o'clock in the morning, and the frightened animal rushed to the end of its picket line and tugged at it, and set up that unearthly noise which only a horse is capable of when badly scared.

The companion on guard awoke about the same time, while those in the wagon speedily tumbled out. They were none too soon, for they could feel the heat on their faces. But a little distance to the south, perhaps it was further than it seemed, but it was not far, was a fierce, high-leaping, surging, rolling wall of fire. The smoke rolled above and almost touched the white wagon top. The fire surged and rolled and fell and leaped and plunged and crackled and roared, and the black-burned grass stems —some of them still glowing—were driven in their faces and settled around them.

It seemed as if the fire to the east and west was already advanced, and that the line of flame was rapidly closing in a semi-circle. It was light as day, but when they turned to the north they looked into a great, black, inky cave, at the mouth of which the horses plunged and neighed and glared back at the dreaded fire with crazed and bulging eyes.

To give the narrative its proper degree of sensationalism, it ought to have been the case that there was but one match in the crowd, so that something could be said about watching it 'flicker, almost go out, and then burn bright and clear.' The fact is, they had plenty of matches. But, in the excitement, it seemed as if none of them would ever be found. It looked as if the fire had covered half the distance before the first match was produced, then it was a brother sentinel who brought it to light. He ran a short distance in front of the wagon, which stood parallel with the fire, so that the fire that he proposed starting would not reach the horses, and knelt in the tall grass. The first match went out, quite after the most approved form. The next did better. It burned, the dry bunch of grass caught, the flame hurled up in their faces as they leaned anxiously over it, and then leaped to the next bunch, then to both sides away to the north, making a rapidly growing oasis of safety. It was none too soon. They cut the picket ropes and led the horses around upon the burned space, one of them

beating out the feeble flames that tried to work toward the wind. They hastily pushed the wagon into a place of safety and stood behind it to screen their faces from the fierce heat. The fire swept up to the little burned spot, reached over angrily, found nothing to feed on, again leaped high in the air, swayed, wavered, flickered and went out.

The air was hot and stifling for several minutes; then came the cool, strong wind, which was now sweeping the flames away to the north, the little saving fire overtaken and swallowed up in the greater. A half hour later there was a feeling as if a great storm had passed, and far away to the north the smoke hung like a cloud with the fire playing angrily about, low down in broken lines, as the lightning sometimes does after a thunder storm. There was no sound save the steady rush of the wind, which was not loud, as the long dry grass it had murmured through before was gone.

In the morning the brownish gray landscape of the night before was black as night. The coal black ashes lay everywhere and were hurled about by the wind. Far to the north, across the black

A ROUND-UP.

billows of the prairie, there was a low cloud of smoke. It was a landscape in black; it was only broken by occasional bleached buffalo bones, with the great, broad, startling skulls lying white and ghost-like in the sea of black.

We have quoted Mr. James in his most serious mood when dealing with the barb-wire and free-grass question. The same versatile writer adopts quite another tone and style in reference to the preparation for the old-time round-up. In a very tantalizing way he tells his readers that this old-time round-up was something which can only be very imperfectly imagined by those who never saw one. "But," he continues, "if you will draw on your imagination for a picture, I will try to give you what you could have seen had you driven up to a ranch and found them making preparations for a round-up. I will give it as I saw it last. Driving in from the north over a prairie country, with now and then a grove of trees, we picked our way down a winding hollow or ravine for one or two miles, sometimes over one side of the hollow and sometimes on the other. Finally we came out in the open valley, that stretches for a mile or more down the creek on either side. In front of the house stood the old grub wagon, which had done service for years, with the barrel securely fastened to one side. The grub-box setting in the hindmost end of the bed, with its shelves and its door that dropped down. The cook is now busy cleaning it out. In fancy I can see him now, as he stood there with his sleeves rolled up

and his pants turned up at the bottom. Just beyond, and in front of the wagon, stood one of the boys plaiting a whip. Astride the tongue of the wagon was another, mending his saddle and singing as was his habit when busy. Out at the end of the house was one of the boys scraping some rawhides for hopples, and down the valley one of the boys came leisurely driving some ponies. Out on the wood-pile two of the outfit were trying to make a horse-trade, while the remainder of the boys were in the pen, branding some horses before starting out.

"Now, if you want to know it better," concludes Mr. James, who, having excited the reader's curiosity aggravatingly, leaves it unsatisfied, "just go down and see for yourself, which you will hardly do, as that has been sixteen years ago, and everything has so changed since as to make just such a thing almost an impossibility."

A series of reminiscences, such as the above, does more to depict the condition of the cattle industry at the time of the war than any sternly written record could possibly do. As Mr. James puts it so delightfully, and with somewhat of an old Irish "bull," just go down and see for yourself what used to be done sixteen years ago or more, although everything is so changed as to make such a thing almost as impossible as your playing such a trick with time and the calendar.

The round-up in those days was something almost majestic in character. It is scarcely correct to say that the Texas round-up is now a thing of the past, but it is accurate to state that the round-up of to-day bears no more resemblance to the round-up of a quarter of a century ago than does the Texas of to-day, with its countless railroads, highways, towns and farms, resemble the State in the days when free grass was general, and when enormous herds of cattle strayed unmolested and almost uncared for on the vast domain. In a subsequent chapter we shall see how the abolition of the general round-up affected the policy of the only really permanently successful cattleman's association in the world. In the early days of that association dates and locations were fixed for round-ups, and its members participated in these generally and in common. To-day that association recognizes the fact that the great round-up of old is no more, and instead of working in this way, Inspectors are appointed to watch shipments of cattle to and at the different markets, and to prevent the general and even casual stealing of animals.

In the chapter on the duties and characteristics of cowboys we shall learn more concerning the incidents of the old general round-up, and shall see how it differs from the round-up of to-day, interesting as the latter event still is. At the time of which we are writing it was difficult to get cattle to market in any way. At the time of the outbreak of the war a few droves were got to market by swimming them across the Mississippi River below Vicksburg. These efforts were generally crowned with signal failure, and then, to use Mr. McCoy's words, "there dawned a time in Texas when a man's poverty was estimated by the number of cattle he possessed." Cattle having no marketable value, they were frequently deserted altogether, and other stocks were offered at such prices as a dollar or two dollars per head. Speculators naturally rushed in, and tens of thousands of cattle were bought up and held for driving North in the spring of 1866. It is believed that more than a quarter of a million head of cattle actually crossed the Red River during that year, but of these comparatively few found a profitable market. Lawlessness was general in Southern Kansas and Missouri, and under the pretense of danger of infection drovers were mobbed and even badly injured. Many fights took place, resulting in loss of life on both sides, and an immense quantity of cattle were stolen and stampeded. Frequently a Texas cattleman was compelled to sell out at nominal prices, but when he had money he could generally buy a right of way and secure comparative immunity from injury while driving.

Countless trails were used for the purpose of getting cattle to market. The Chisholm trail is a comparatively modern one, although it, like the others, has given way to the curtailing influence of settlement and fence. Of the Sante Fe trail we have already spoken, and the others were so numerous and so broken up in places that it would be difficult to give a detailed list of them. From the Red River to the southern line of Kansas occupied between three and five weeks to drive a herd of cattle, provided circumstances were favorable. In the old days of trail driving it was found advisable to allow the cattle to string out at great length, and then, as now, certain cattle would take the lead and others bring up the rear. It would seem as though in cattle, as in human beings, there are natural born leaders, and it was always best to allow the animals to string out to suit themselves. The most

reliable and experienced cowboys went with the leaders, and their great work was always to get these to swim streams and rivers which intervened before the bulk of the herd caught up. In the case of small streams and rivers not running rapidly very little difficulty was experienced. The cattle would be started across by aid of the leaders already referred to, and it has always been found that although steers have not the follow-my-leader instinct so fully developed as sheep, they will keep in line and even encounter danger if their somewhat limited reasoning capacity convinces them that others of their kind have got through with a whole skin.

It need scarcely be stated to those who have crossed Texas, the Indian Territory and adjoining country by rail, that there were rivers to be crossed which were at times dangerous in the extreme. It was often very hard to persuade the leaders to plunge into the Cimarron and other treacherous rivers when they were at their height, and superhuman efforts were made to get the leaders through before the bulk of the herd came up, experience teaching that the greater the number massed on the banks the more impossible the task of getting them across the water. It may seem strange to speak of discipline in the ranks of a drove of cattle, but certain it is that in some instances the animals were so well under control that the leading cowboys would swim even a rushing torrent, with a reasonable certainty of the cattle following them. When this trick failed, there was often a loss of two or three days in getting the cattle over, and a great deal of shrinkage and damage followed. Sometimes it even happened that a herd of cattle would lose its head in crossing a wide river, and remain for hours without making any progress. Then some of the most intrepid cattlemen would risk their lives, get in the center of the mass and try and frighten some of the animals into making headway.

Even when the herd was over, the difficulty of getting the camp wagon across a very wide river had to be surmounted. Necessity is said to be the mother of invention, and that constant friend of the cowboy, the rope, came into requisition. A number of these were tied together and the wagon dragged across as best it could. River crossing being thus dangerous and costly, trails were selected with as few river fords as possible, and anxious inquiries were made at every hand as to the condition of rivers which it was impossible to avoid.

There were weird scenes in those days on a cattle drive. As Mr. McCoy tells us, the old saying that "music hath charms to soothe the savage breast," was thoroughly proved again and again on these occasions. Just as the snake-charmer lulls into innocuous desuetude the poisonous reptile before him, so did the old-time cattle drover and cowboy quiet many a stampeding steer, by night as well as by day, by singing as well as shouting. A gentleman who is now a financier on a large scale, and who was wise enough in his generation to dispose of his entire stock of cattle before the expiration of the period often spoken of as the "seven years of plenty," talked very entertainingly to the writer of these chapters on this subject. "I learned to sing," he remarked, as he lit a very fragrant Havana in the smoking compartment of a Pullman car, "at a Sunday-school when I was young and good. But my voice was developed, and I first appreciated what singing really meant, while driving cattle on the old Shawnee trail, twenty years ago. Perhaps you think we sang for fun on those occasions, but we didn't. It was often the case that every known method of quieting a stampeding herd would be tried without success, and then one of the boys would say, 'It's no use, boys, let's try a little music.' Then some one would strike up a tune, and the refrain would be taken up all along the line, one man singing bass, another tenor, and another a kind of combination of every recognized voice and tone.

"What did we use to sing, do you say? Why, hymn-tunes almost exclusively. I am not joking when I say that The Old Hundredth had a more soothing effect on wild cattle on the run than any tune of which I have heard. We have sung and hummed it, with variations, by the hour, and frequently have succeeded in quieting a disturbance by this means when no other attempt met with partial success. One night in particular I remember, when we sang ourselves hoarse in an attempt to restore reason to a gang of crazy cattle. In cattle driving, as in everything else, things are apt to follow in a groove. The business man who oversleeps himself in the morning and gets to business late, generally finds that everything goes wrong until nightfall, and that financial and other troubles crowd upon him. It was just the same in driving cattle on the trail, only more so. If the cattle got upset and in a bad temper during the early part of the day, there was going to be hard work to keep them going until nightfall, and there would be sure to be trouble during the night. On this particular occasion it had been raining

incessantly for forty-eight hours, and if the steers we were driving felt half as miserable as we did, I don't blame them for getting contrary. The lightning got very vivid toward night, and the herd commenced to stampede.

"To stop this we persuaded the leaders to adopt a circular course. Nine times out of ten this would put a stop to a stampede altogether, but this being an unlucky day it was evidently the tenth time. Instead of stopping the stampede, we converted it into a circular one, and a number of animals were badly injured, to say nothing of the general damage to the entire herd. We checked that imitation of the modern roundabout or whirligig country-fair feature by stationing ourselves at regular distances outside the circle and singing at the top of our voices. Every man had a cold, and could have fairly excused himself from taking part in musical exercises on the ground of being out of voice. But it was our only alternative, and we took the advice of the eminent divine who, when blaming his congregation for lack of heartiness in singing, said that those who could not sing should shout. It looked at first as though the beeves resented our poor musical effort, for they took no notice of us for awhile. But we persevered, and after nearly an hour's hard work, under exceptional difficulties, we got the animals quieted, and the majority of them were lying down and resting."

Those of our readers who have grown up with the trade, and who served their apprenticeship to trail driving, as to other hard features of cattle raising in the early days, will agree that the above story, so far from being anything out of the ordinary, is merely a graphic description of a scene which occurred frequently on almost every drive in bad weather, or with exceptionally wild and refractory steers.

But there were serious difficulties which had to be met by other means than mere singing. After driving for days and weeks, and, in some cases, even months, the man whose entire fortune was represented by the cattle before him arrived at one of the few markets or shipping points in Western Kansas. Sometimes a buyer was found there and sometimes the cattle were shipped on. The famous, or infamous, Texas cattle law of Kansas was practically nullified by the action of the Governor, and an immense number of the cattle were driven on the trail to Abilene and other points. Mr. McCoy, in dealing with this period, calls attention to the fact that Texas cattlemen were clannish and easily misled by promises of high prices. He records the fact that a secret meeting was held in 1867, at which a number of drovers pledged themselves to hold their cattle for three cents per pound gross, and to sell none for less. The law of supply and demand appears to regulate, or at least influence, the price of all commodities except beef, and this fact should have been as patent at the close of the war as it is now. During the last few years we have seen the price of fat cattle fall in the face of a reduction in the number sent to market and an increase in population; and we have also seen that even in view of absolute shortage, prices have been kept down. *Some of the influences which have produced and maintained this anomaly existed on a smaller scale twenty-six and twenty-seven years ago, and hence it was that the men who established the three cents minimum were guilty of a financial and tactical blunder.

They argued that great preparations were being made at the stock yards for handling the cattle, and also for securing increased shipping facilities. Unless the cattle were worth a great deal more than offered, they reasoned, this step would never have been taken; and they accordingly built castles in the air, and dreamed peacefully of large prices and prompt payments. But it was a case of the sellers proposing and the buyers disposing. After refusing fairly good prices at the shipping points, the patience and the funds of the cattlemen were simultaneously exhausted, and many of them shipped to Chicago and elsewhere on their own account. After paying the freight of six or seven dollars a steer, they, in many instances, received little more than two cents per pound, and thus lost instead of made money on either their work or their speculation.

In 1860 the United States census had credited Texas with about three million five hundred thousand head of cattle. During the five or six years which followed, the trade, as we have already seen, was completely demoralized and it was difficult to keep track of how many cattle there really were in the State. It is doubtful whether a quarter of a million were driven out of Texas north in 1867, and if

*Since the above was written the shortage of cattle in the early spring of 1895 has caused prices to go up in a logical manner. This fortunate occurrence is, however, unusual, though not entirely unanticipated.

there were more than that, the records of their successful disposal are not to be found. Mr. McCoy states that thirty-five thousand head of cattle were driven from Texas to Abilene, Kas., during the year, and that a large quantity of these had to be sent into winter quarters, although others were slaughtered and the product shipped to New York. Those who went into winter quarters seemed to have been the most fortunate, because the year 1868 was a much better one for the cattlemen. Mr. McCoy records the fact that in the fall of 1867, when Texas cattle were selling at from twenty-four to twenty-eight dollars per head in Chicago, a bogus packing company of that city was represented at Abilene by an aristocratic looking man who succeeded in swindling the drovers by the dozen. From time immorial there has existed in mankind an irrepressible desire to get something for nothing, and it seems as though the public has never learned, and never will learn, that philanthropy and business seldom go hand in hand. On this occasion the smooth-tongued individual condoled with the cattlemen on the shameful prices they were obtaining for their fat stock. He assured them confidentially that the quotations from Chicago were doctored to their injury, and concluded by offering them from five to ten dollars per head more on the Kansas prairie than the commission men were paying in the stock yards at Chicago.

Thousands of cattle were disposed of to this gentleman, who agreed to pay for them at the rate of about thirty-five dollars a head, although the cattlemen would have gladly accepted twenty-five or thirty dollars. A merely nominal deposit was made to bind the contract, and the cattle, which were practically stolen, were loaded on the cars and billed in the name of the buyer, all ownership in them being thus practically abandoned by those who had raised and fatted them. Fortunately for the credulous drovers, those in charge of the yards called their attention to the folly they were perpetrating, and persuaded them to have the cattle billed in their own name. This saved some of the cattlemen from entire loss, and the consignments being turned over to reliable commission men, something like eighteen dollars per head was received.

Another swindle which was more successful was perpetrated a little later. A man traveled from Illinois to Western Kansas, and by the judicious expenditure of money in saloons and similar places, made himself exceedingly popular, and earned the reputation of being a man of colossal wealth. Gradually he dropped hints of his ability to handle cattle under the most favorable conditions, and it soon began to be the fashion to offer him large droves. One in particular he purchased consisted of nine hundred steers. For these he was to pay at the rate of thirty dollars per head, and he actually produced and paid down two thousand dollars in cash. He immediately had the cattle loaded in his own name, and the people in charge of the yard were so astonished at the transaction that they felt it their duty to warn the shipper of his risk. The warning was scouted and the transaction was completed, being followed by several others, until at least he was about seventeen thousand dollars ahead of his victims. We find it on record that the man from Illinois was arrested and jailed, but the records are silent as to a solitary dollar ever being refunded to his victims.

Other calamities befell the cattlemen during the year following the close of the war. It was an unfortunate year, with poor grass and sundry other difficulties, and an immense number of cattle were shipped by rail only to be sold at prices little above, and often a little below, the freight charges. Shipping from Abilene, Mr. McCoy tells us, did not begin until the fall, when, notwithstanding the practical demonstration of the feasibility of cattle shipping over their road, the managers of the K. P. Railway in St. Louis were incredulous and freely jested at the whole project, regarding it as the big joke of the season; but there was one young and worthy man in the office of 'purchaser of supplies' who was firm in the belief that there was yet something to be expected of the undertaking at Abilene. He was jeered at by every other officer, both great and small—and most of them were small in more senses than one—who ridiculed him as one championing a self-evident failure.

"On the occasion of the shipment of the first train load of cattle, a certain 'Managing Director' approached the parties in interest at Abilene, and proposed to enter privately into partnership, and, as an inducement to the acceptance of his proposition, said that he would work secretly in the executive committee in St. Louis for the special advantage of the work. After consulting over the matter, the parties concluded that a man who would be willing to 'sell a railroad company' would be equally as willing to sell another company. So they rejected his proposition, which excited the

Managing Director's ire and indignation to a high pitch. But, not long after this occurred, a certain subordinate railroad official appeared at Abilene, and expressed a deep desire to make some money out of the cattle trade; or, in other words, asked the party who was building the yards if he would not give him a certain amount on each car loaded. After a few moments' reflection—in which the many courtesies and the kind aid that had been extended to him by this official were mentally reviewed—the official was told that at the end of the season he might expect a present of an amount of cash equal to one-half the sum for which he had asked. This proved to be an unfortunate step, and was the only one of the kind ever made by that cattle-trader, for no sooner had the next season opened than this same official reappeared at Abilene, demanding one-half the gross amount which the parties were to receive from the railroad company for their services and expenditure during the year 1868. And when this modest request was declined the official left, muttering threats of vengeance, and did actually go to a point twenty-five miles west of Abilene and give a lower rate of freight from that point than was given from Abilene."

Mr. McCoy naturally gives to Abilene special prominence in his narrative, but we quote him because, as we have before remarked, he is the only man who has given to the world at any great length even a disjointed record of the incidents of the cattle interests of Texas and the Southwest during its most critical periods. We conclude this chapter by again quoting from Mr. William Kuykendall, and condensing some of his well-written observations. In further communications to the "TEXAS STOCKMAN AND FARMER" this gentleman calls attention to the fact that upon the passage of the act of secession in February, 1861, the Texas seaports, as well as those of the South generally, were immediately blockaded by the Federal Government, which effectually closed the New Orleans market against the cattle trade of the district in which we are most interested. The tremendous influence of railroads has minimized the importance of New Orleans as a market and shipping point, but in the halcyon days of the Mississippi River trade that city was of the first rank, and it came to the rescue, again and again, of cattlemen in their most dire distress.

The closing of its market put the cattlemen in a most harassing condition, with no market for their product and with little hope of one. Finally, an effort was made to drive overland to Southern Louisiana to points from which access to New Orleans by rail and water could be obtained. The rush thither, during the spring and summer of 1861, was characterized by that suicidal policy which has so often proved disastrous to the financial success of the cattlemen under similar circumstances. The market was glutted and prices ruled in sympathy, many realizing little more than sufficient to defray the expenses incident to marketing.

As a natural result, the trade was of short duration and with its cessation terminated the marketing of cattle in Texas until after the restoration of peace between the North and South, with the exception of supplies furnished the Confederate Government. During the first half of the decade beginning in 1861 occurred the most disastrous drought in the history of Southwest Texas, resulting in great loss of herds along the seaboard. The death rate in some localities was estimated as high as seventy-five per cent. In one respect this disaster proved a virtue in disguise, as it offered the only available means of recuperation to the overstocked ranges at that time. No invading armies despoiled Texas homes or confiscated Texas property, as had been the case with most of the less fortunate Southern States. But the resources of Texas people had been heavily taxed to meet the wants of families at home and supply the armies in the field, and many who were fortunate enough to escape the casualties of war found their herds decimated and themselves bankrupt on their return home. But, with that true Spartan courage that distinguished our soldiery upon so many bloody fields, they were undismayed, and began resolutely to build up their herds and their fortune. By energy and assiduity, aided by a series of favorable seasons, the increase of their herds was phenomenal.

Soon after the resumption of trade relations, the shipment of beef to New Orleans was again resumed, and fair prices were obtained for suitable cattle, reaching, in some instances, as high as twenty dollars per head, though the average ruling prices on the range were from sixteen dollars to eighteen dollars. As was the case prior to the rupture of trade in 1861, the Morgan Steamship Line did a greater portion of the carrying trade. Others competed for this lucrative trade, but with varied success, the Vanderbilt Line offering the most stubborn opposition. Jim Foster, the pioneer in the

business, continued for some years to monopolize the trade, having secured by charter the entire carrying capacity of the Morgan line of steamships, which plied between New Orleans and the Texas ports. He was a shrewd man of business, and, through the exclusive privileges enjoyed in this trade, readily accumulated a large fortune. He did his purchasing principally through agents, who visited the ranches throughout the country for that purpose.

At that time, during the summer season, the market suffered more or less by depression, and as his contract with the steamship company stipulated a fixed sum per trip, whether any cattle were shipped or not, amounting to about ten dollars per head, but little margin for profit was found upon a dull market; and, in consequence, he made it a rule, under such conditions, to allow the cattlemen the privilege of filling his contract with the steamship company for one or more shipments. This generosity was never extended, however, when beef was commanding reasonable prices. "I recall," says Mr. Kuykendall, "a few amusing incidents in point that will bear relating for the purpose of illustrating how completely the producers were at the mercy of this shrewd monopolist. A party of ranchmen secured a vessel, under the conditions above stated, to make a shipment. The shipment was promptly made and they impatiently awaited the returns. But no returns came, however, but instead an account of sale, etc., exhibiting the fact that their cattle failed to fetch enough to meet the expenses of shipping, and they found themselves poorer but wiser men. Upon another occasion, a friend of the writer secured a vessel to make a shipment, and kindly offered me the privilege of providing a portion of the cattle, to which I readily consented. We shipped upon the same vessel, but consigned to different commission firms. When our cattle were safely aboard, my friend wagered me a fine hat his cattle would command a better price than mine. I took the wager and in due time returns were received, which disclosed the fact that my cattle had netted me the sum of five dollars per head in depreciated greenbacks, and my friend's just netted him sufficient to meet the shipping, sale and other incidental expenses, and he was due the wharf company seventy-five cents per head for wharfage. It is needless to say the hat was never demanded.

"The limited market of New Orleans became inadequate to consume the rapidly increasing surplus that was accumulating upon the ranges, and enlarged marketing facilities were demanded to meet existing conditions. The low price that inferior grades were commanding induced a company of Eastern capitalists to establish a packery near the range for the purpose of supplying New York, Boston and other large cities with cheap meat. Acting upon this idea, a packery was established on the Guadalupe River, near the town of Victoria. Dr. W. G. Kingsbury assumed immediate superintendence of the plant, and began the slaughter of cattle in the fall of 1868. The method of preserving meat practiced by this company was by refrigeration. The writer had the opportunity of inspecting some of the product of this plant, and it seemed to be well preserved and in every way a first-class article, and gave promise of success. But from some cause it failed of success, and, after a short time, was discontinued.

"Later, during the period of the next decade, other packeries were established at different points on the seaboard, with the object of slaughtering, principally for the hide and tallow. The most important of these were located at Fulton, in Aransas County. Thousands of rough cattle were consumed by these companies, and the supply under these heavy drafts began to diminish, and a gradual improvement in valuations no longer justified a continuance of this crude mode of marketing. With the closing of these ventures, which occurred after a few years of active operation, the era of slaughtering cattle in Texas for the hide and tallow had passed to return no more.

"But as a logical sequence, upon the cessation of this demand, which held in check, if it did not entirely subdue, over-production—the cattlemen's ever-present Nemesis—the supply again soon exceeded the demand, and the opening of other markets became a necessity, as in the past, to the healthy growth of the industry. Urged by this necessity, toward the middle of this decade the movement of the West was revived. Beginning at a most favorable time, when the influx of population was directed to the great plains of the Northwest, the trade at once assumed gigantic proportions, and with the demand for beef also arose an active demand for young steer cattle which were designed to be matured upon the new ranges of the West. Under these stimulating influences great activity characterized this era of the industry, and attracted the

attention of capital, both foreign and domestic, and hastened that red-letter day of the industry now rapidly approaching.

"We have now arrived at what may be properly termed a transition period in the cattle industry of this State. Influences were at work which, within a few years, were destined to revolutionize the business. Heretofore 'free range' was obtained throughout the grazing sections, and stock was confined only by natural boundaries. The grazing lands were either State lands subject to location or owned principally by non-residents. As early as in 1875, in anticipation of the approaching changes in the system, the more alert and far-seeing of the ranchmen began to secure land by purchase, which at that time was comparatively cheap, owing to an almost total want of demand in the grazing region."

COMANCHE INDIAN OF TO-DAY

CHAPTER IV.

The Romance and Reality of the Maverick; or, Cattle Stealing as a Fine Art.

BEFORE dealing at any length with what was referred to in the concluding paragraph of the last chapter as the transition period in the cattle industry of Texas, and, indeed, of the United States, and the conditions and causes which led to a revival in the trade and sowed the seeds for the immense prosperity of the early eighties, we must devote some space to one of the most extraordinary drawbacks any trade or interest ever encountered.

We refer to the systematic, continuous, day-in-and-day-out stealing of cattle.

The conditions under which cattle were bred, raised and fed prior to, and for several years subsequent to, the war, were calculated to encourage rather than discourage theft. Allusion has already been made to the half-sarcastic, half-earnest by-word of the cattle country of a generation or less ago, that all that was required to stock a ranch was a branding iron and nerve enough to use it. Droves of cattle, as we know, were branded and turned loose on the open prairie, there to follow their own sweet will and find pasture where best they could. Herds intermingled and together wandered in different directions. There was often a tendency to travel south, on account of the northers which passed over the plains during the winter months. Cows and steers will stand an immense quantity of cold without suffering very keenly, but they have an objection to meeting a storm with their face to the foe. Hence, the herd in the old free grass and open range days generally pastured with their heads in the direction toward which the wind was blowing. Unconsciously they often traveled many miles in front of a storm, and the spring would find herds many, many days' journey from their owner's headquarters.

It was generally understood that while cattle were roaming on the range the less they were interfered with the better, more especially in the winter. In the semi-wild condition which followed, the animals were better able to take care of themselves, and when food was scarce it was found that the less herding that was done the better. The animals always had a habit of splitting up into bunches and taking possession of a valley or slope where water was available. Their unerring instinct seldom failed them in this respect, and as long as water remained they strayed but little. When, however, there was a dearth of this indispensable item in the daily bill of fare even of steers and cows, the animals would travel immense distances in search of pools and brooks, and many a lost traveler has had his life saved by locating a single-file cattle trail and following it to water.

At the first advent of winter the cattle generally left the high ground and sought shelter in the valleys. Heavy timber along the banks of streams was always popular, and herds have been known to subsist all winter on bark and leaves from friendly trees. When, at last, the time came for the round-up—we use the term in its old general sense and not in its modern and restricted one—each cattle-owner sent one or more cowboys to represent his brand and take charge of his stock. Two or three months were often occupied in scouring country and getting the stray cattle together for the purposes of division. When all were got together the cutting out began, those owning the largest herd having the first right, and the smaller owners coming last. The cowboys rode through the mass of cattle until they saw a cow and a calf with his ranch brand on it. Efforts were then made to persuade, by more or less rough means, the couple to leave the herd, and sometimes they were got to the edge without great difficulty. The cow generally suspected some fell design on her offspring, and the maternal instinct, always conspicuously strong in the native breed, would show itself by crowding her calf back into the herd where the safety of numbers formed, at least, a small consolation. There was no great difficulty in getting the cow out of the mass, but care had to be taken not to separate the calf, because, this being unbranded, the only claim to ownership rested in its being attached to its branded mother. If the calf was thus separated the cow had to be liberated, and in a short time, after a great deal of noise, a happy reunion took place between mother and calf, and once more the work of cutting out recommenced.

The branding of calves, which followed the cutting out on the round-up, was performed somewhat in the manner of to-day, though there were less facilities at hand, and the work was often more roughly done. As this branding has so much to do with the question of cattle ownership and cattle stealing, we produce here a very realistic description of the old-time process by Tex Bender in "TEN YEARS A COWBOY," published by Rhodes & McClure, of Chicago.*

"If the outfit to which the cows belong has its principal range at some distance, the batch must be taken off and driven and watched till they arrive at their own range. It is not absolutely necessary to have a corral to brand in, but if you can run your bunch into one it saves trouble. The corral is roughly and strongly made of posts and rails about five feet high; it should be big enough to hold your bunch of cattle, and leave room for working. Just outside a fire is lit, and one man keeps the brand hot, which he passes through the rails as called for. In a small corral one man on horseback is enough inside, and he can be dispensed with unless there are any calves to handle. A man, armed with a rope-lasso, catches a calf by throwing it over his head; if a little fellow, the calf is thrown down, cut and branded in a very short time; but a calf of two or three months, even, is not so easily managed. The noose having been tightened on his neck, the end of the rope is passed round one of the rails; the calf gallops up and down the arena at the fullest length of his tether, jumping and bellowing as if he knew his end was coming. By degrees the rope is overhauled, and the length which gives the calf play is shortened. One of the men will then go up to it, catching it by the rope round the neck in one hand, and passing his hand over its back, by the loose skin on the flank near the stifle, with the other. The more the calf jumps the better, and if he is slow and stupid, he will get a shake to rouse him. Taking the time, therefore, by the calf, the man seizes the opportunity of one of his prances, puts a knee under him to turn his body over, and then lets him drop to the ground on his side. Another catches hold of a hind leg, which is stretched out to its full length; the first sits near its head, with one knee on the neck, and doubles up one fore foot. The calves generally lie quietly, and do not bellow even when they feel the hot iron; but a few make up for the silent ones by roaring their best.

"A good-sized calf gives a lot of trouble. After the rope round the neck has been drawn up, another noose is thrown to catch one of the hind legs, which should be the one not on the side to be branded. This rope is also passed round a rail and hauled tight till well extended. Somebody takes hold of his tail, and with a strong jerk throws him on to his side. A hitch is taken with the same rope round his other hind foot; the noose is loosened round his throat, but the man leans his best on his neck and holds his fore leg tightly. He must look out for the brute's head, as the calf throws it about, and if it should strike the man's thigh instead of the ground, as it is very liable to do, he will receive a bruise from the young horns which he will not have the chance of forgetting for a good many days. The brand should not be red-hot, and when applied to the hide should be pressed only just sufficiently to keep it in one place. The brand, if properly done, shows by a pink color that it has bitten into the skin, well through the hair. Some of the stock, in the early spring, have very shaggy coats, and a brand applied only so long to their hide as would answer in most cases, would leave a bad mark which would hardly show next winter. The calf, when finished with, generally gets up quietly, so soon as it feels the ropes loose, and rejoins the others. The cows seldom interfere to protect their progeny; when you do find one on the warpath it makes the ring lively, and all hands are prepared, at short notice, to nimbly climb the fence or jump over.

"To keep steadily at catching, throwing and branding is hard work. The sun is hot, the corral full of dust from the cattle running round and round, and your clean suit is spoiled with the blood and dirt of the operations; you may have, besides, a tumble yourself when throwing a calf. The process is still worse if rain has fallen, and the cattle have probably, for want of time the day they were corralled, been shut up through the night. As they run round and round to avoid the man they see swinging his lasso, the whole area is churned into mud. The animals dragged up get covered with filth, which is passed on to the men at work. There is a certain excitement about the business; the cowboys will work at it very hard and through very long hours. The boss is a great sight, and never tires running backward and forward between the fire and the struggling calves. Each time he slaps on

* Further details of branding, past and present, are given in subsequent chapters, notably in the one dealing with cowboy file and characteristics.

the brand he seals a bit of property worth ten to fifteen dollars. He would like to work at this all day long. If the corral is very large, the ropes are thrown by a man on horseback. So soon as a calf is caught, he takes a turn with the end of the rope round the horn of his saddle, and the horse drags the animal to the right spot. A cow accustomed to men on horseback will sometimes run after her calf with her nose stretched down toward it, no doubt inquiring the nature of its trouble and a 'What can I do for you'; but so soon as she nears the men on foot the cow stops, and then leaves the calf to its fate. If branding is done in the open, one man holds the bunch together and the lassoer picks out the unbranded calves and drags them off to the fire."

At this period in the history of the cattle interest a very small percentage of owners lived upon their ranches. Railroads were far less numerous than they are now and the country post offices on the various star routes were the most convenient methods of locating a residence. Around these post offices there generally grew up a little village with probably a general store, where articles of food could be obtained, and also ropes, hopples, wide-brimmed hats, and sometimes saddles, bridles and bits. Frequently ranch owners made their headquarters within a few hours' journey of some such post office, in order that the clerical and financial portion of their business could receive better attention.

Naturally a point as centrally situated as possible to free grazing lands was adopted for the headquarters of the ranch, with water as a *sine qua non*. To-day the artesian well has practically solved the problem of water for the Texas ranchmen, and thousands of dollars have been spent in sinking these wells, which, generally speaking, have proved a great success. The fencing-up characteristics of the present time have made this necessary, and it is generally found that the expenditure of about five hundred dollars will provide a well, wind-mill and necessary effects. But in the days when cattle stealing flourished and the "rustler" was a man of recognized occupation, this aid to cattle raising was not thought of, and natural or running water had to be sought.

Knowing that his cattle would of necessity stray at times many days journey from his headquarters, the ranchman recognized from the first not so much the importance as the absolute necessity of branding. The cattleman of old either purchased enough land to enable him to put up the necessary buildings for his proposed business, or took advantage of the laws formally in force, and practically squatted without buying anything. Having fixed up his corrals and buildings, he looked through the list of recorded brands and selected a ranch brand and ear-mark as different as possible from anything already recorded. It would require an entire chapter to even describe these brands and the result of the description would be neither interesting nor valuable. Suffice it to say that some ranchmen adopted a number, others a letter or an inverted letter, and others a monogram or some kind of a composite letter in which the initials of their names formed a conspicuous feature. Thus, the Cross-Ell ranch adopted XL as its brand, or perhaps to speak more correctly, the brand adopted gave the name to the ranch. The first ranch to use a diamond for a brand was known as the Diamond Ranch, and there speedily grew up in various parts of the State ranches with such peculiar names as Boot, Saddle, Horse-Shoe, Double X, Fist, Bit, Bridle, Alphabet, on account of the brands adopted, that for the last name in the list being a combination of the letters A, B, C. A road brand was also adopted, used for the purpose of marking cattle purchased by a drover or cattleman with a view to immediate disposal at the best available market.

Mr. James, in giving his personal recollection of brands and the way they were used, says that in the open range days no two men were allowed to have the same mark and brand recorded except as a partnership mark and brand. Some men had more than one brand, but they were recorded in the brand records of the county in different names. "For instance," says the gentleman quoted of the free-range days, "a man had ten children and one wife, and he could thus record twelve different marks and brands. Many men had the same mark and different brands, and many had the same marks and brands, but lived in different counties. There may be people in the world who don't know what a mark and brand is. I have heard people in St. Louis, Kansas City and Chicago, where thousands of cattle are slaughtered every year, talk about a cow being marked with a letter B, or some other letter or figure. One young lady was telling me about her brother's mark, and she showed it on paper. It was A-X-T-L. This young lady said she had spent five months on the ranch, and had been on several round-ups, and still she claimed her brother's *mark* was A-X-T-L, and couldn't tell what

her brother's *brand* was. I don't suppose her observation of cattle had been very close, as she seemed to know more in a minute about a young cowman she met there than anything else. The boys seldom take much pains to teach the young ladies that come from the States more than one lesson at a time, and that is how to love a cowman. Sometimes they succeed; again, they make hopeless failures. No, we didn't mark cattle with A-X-T-L, or B, or N-M, or any other letter or figure, but with a red-hot iron we burned those letters, or whatever brand we wished, into the hide of the poor, bawling animal, and called it a brand, and we cut some sort of a slice out of their ears, and that is called marking them. The names given marks are crop, split, under-bit, over-bit, under and over-hack, under and over half-crop, steeple-fork, grub, under and over slope and swallow-fork. Now, these different cuts in the ear are capable of many combinations. To illustrate, one may mark with swallow-fork and under-bit the right, and over half-crop the left, or crop the right and under-slope the left, or under-slope each ear or over and under-slope the right, which is called a sharp, and crop the swallow-fork the left, or under-bit the left and over-bit the right, and I could take up one hundred pages with the marks I was familiar with and never name the same one twice.

JACK MILES TIME, 48 SECONDS

"This, then, was marking and branding, which was accomplished with a good, keen knife, and a red-hot iron. In some instances, in the absence of an iron, the burning end of a stick was used, but made a poor brand. Some instances have been known where the brand was cut in the hide with a knife, but this method was universally condemned, but, I am not certain, but think there was a law prohibiting it. Some men, however, had very little respect for law; looked upon it very much as an anarchist, an infringement upon their natural rights. I am glad to say, however, that very few of the cowmen had such feelings in regard to the law. They might violate it knowingly, but they never claimed it as a right, but among themselves called it by its right name. Stealing, for instance, was designated as a theft. One 'rustler,' in speaking of another, would designate him as an awful thief, a grand rascal, a renegade from justice, and declared that if he had his dues he would be in the Pen, or hung twenty years ago.*

"A crop meant cutting about half the ear off smoothly, straight from the upper side; a half-crop, either upper or lower, was to split the ear from the tip, midway, about half way back toward the head, and cut off either half. If the upper half was cut off, it was over or upper half-crop. If the lower

* Other writers differ from Mr. James on this point, and many cattlemen remember the time when "rustling" was regarded as smart rather than criminal.

half, it was under half-crop. A split was simply to split the ear as above described and leave it thus. Under-bit or over-bit was to double the ear in and cut a small piece, perhaps an inch, out of either the upper or lower side, an inch in length and, perhaps, one-third that in depth. Under and over hack was simply to cut either up on the under side, or down from the upper side of the ear perhaps half an inch. Steeple-fork was to cut two splits into the ear from the end, back one-third or half way toward the head, and cut out the middle piece, the splits to be an inch apart or thereabouts. An over or under slope was to cut the ear about two-thirds of the way back from the tip, above or below, straight to the center of the ear at the tip. An upper and under slope, you may readily see, would make a sharp look by giving the ear a point. A swallow-fork was to hollow the ear lengthwise, beginning half way back, cut at an angle of forty-five degrees toward the end. The result was a forked notch in the ear, called a swallow-fork. A grub was by far the most cruel mark of any, as it was to cut the ear off smooth to the head. None but very hard men ever used this mark."

Having thus selected his brand, the ranchman went promptly before the proper officer of his county or district and placed the same on record, together with the number of cattle and horses already bearing the brand. This course being taken, the brand was, and for that matter still is, his for all time, and stray cattle found bearing his brand or marks were his property, no matter in what part of the State they might be found. The law as to brands has always been fairly distinct in the State of Texas, as well as in adjoining Territories. Now it is even more stringent. The clerk of the county court of each county is compelled to keep a revised list of all recorded marks and brands, and a record has also to be made of sale of such brands. Precautions are also taken for the registering of marks and brands, not only in the counties where the animals range, but also in adjoining ones, and there are also enactments dealing with counterbranding and other offenses. It is expressly held that an unrecorded brand is no evidence of ownership; and there is now an additional precaution of a county brand enforced in many counties, the mark being placed upon the neck of the animal.

The law calls upon any person who estrays an animal with a county brand to notify the clerk of the county with a full description of the estray, and of all marks and brands upon it. It then becomes the duty of the clerk of the county court to ascertain from his records who is the owner of the animal and notify him, a small fee being paid him for the service. To take up and use or retain an estray without complying with the law is defined by legislative enactment as to come within the meaning of the word "theft," the person guilty to be punished as a thief. Driving animals to market improperly branded is an offense punishable by a fine not exceeding two thousand dollars, and the killing of unmarked or unbranded animals without the production of a proper bill of sale is also an offense. To alter or deface a brand, or to illegally mark or brand an animal, is also defined as a theft, and altogether, at the present time, the law on brands and marks seems to be very complete.

It was less so, of course, thirty years ago than now, but it was still severe; and if it could have been properly enforced, there would have been a good deal less systematic stealing than there was. It was customary to brand calves in the manner already described when they were quite young, and, the process being over, the youngsters were turned loose and allowed to pick up food as best they could until the next round up. The practice grew until a stamp of legality became attached to it of capturing stray calves on individual ranches and placing upon them the brand of the owner of that ranch, the inference being that, possession being nine points of the law, he was as much the owner of the unmarked youngsters as any one else could be.

Of course, such a practice soon led to systematic thieving; and, much as the ranchmen have suffered from stealing, this laxity was, in a measure, responsible for the commencement of the practice. Unbranded cattle over a year old were known as "mavericks," and during war times they were captured right and left by any one who wanted them.

Various stories, all with very little foundation, are told as to the origin of the term. According to Eastern authorities, a humane cattleman declined to brand his stock, on the ground that the act was brutal and unnecessary, but the manner in which the term "maverick" came into vogue as referring to unbranded cattle is as follows:

Sam. A. Maverick bought a stock of cattle from a man named Tilton, on Matagorda Peninsula, and moved them to his ranch fifty miles south of San Antonio, on the San Antonio River, where he built

enclosures and pens and placed these cattle in charge of a negro man and several Mexican herders. Through this negro's drunken negligence the cattle were not branded but were allowed to stray away. In 1855 Maverick sold out his entire holding, brands and rights, to Toutant De Beauregard, who lived near his ranch. Many of the cattle were on the range unbranded and it was in the contract that Beauregard was to hunt them himself, only a specified number having been turned over on the ranch. Beauregard's men hunted and branded cattle in many counties, and when an unbranded animal was found it was spoken of as a "maverick." Thus the name of "maverick" as applied to unmarked stock originated.

Mr. James places himself on record that before the war, and even for many years afterward, cattle stealing in Texas was virtually licensed. It was simply a finable offense, he points out, to steal a cow and proceeds to show that cattle stealing was licensed very much in the same way as gambling and other offenses are still licensed in many States. It frequently happened in the early days that a fine of twenty dollars was imposed for cattle stealing, and during the time allowed the man in which to pay his

BUNCH OF MEXICAN CATTLE.

fine, he would go out and steal enough cattle to pay it. In 1873 cattle stealing was made a felony, but prior to that time stealing was most unfortunately general.

We have seen that during the war cattle practically ceased to have any tangible value. Shipments fell off until they became practically nominal, and an immense number of cattle were allowed to roam at will. The war with its usual results practically extinguished families, and many widows and children left the State as best they could and rejoined their friends back East, deserting ranches and cattle altogether. A regular business struck up immediately in the art of capturing strays or mavericks, and tens of thousands of cattle were seized in this way. Even after public opinion had asserted itself, and the laws were sufficiently changed so as to make them call a spade a spade and a thief a thief, cattle stealing went on. The business developed into a science and was spoken of as "handling" and "rustling," these two terms not sounding quite so harsh as the good old Anglo-Saxon word "thieving." The professional rustler who stole a bunch of cattle and got away with them safely was said to have "got off with them," and it was common to hear of men having made a "good haul" in this way, just as though they had been engaged in some legitimate business and had made a success of it. An unbranded steer was still a "maverick," and an unbranded horse was often spoken of as a "slick." The

news that some stray cattle and horses were in the neighborhood was regarded as of great importance, and if the animals were not branded the little oversight was sure to be made up for within a few hours. Thieves even sold to each other, and gave regular bills of sale, so as to expedite shipments out of the State. Men came from the war impoverished and heart-broken, and some of these, honest as their intentions had always been, fell in with the idea and took to "rustling." Sometimes they merely secured the nucleus for a herd in this way, but too often the first deviation from the paths of honesty led to others, and a useful member of the community was thus converted into something very little better than a common thief.

Horse stealing has always been looked upon as a more serious offense than cattle stealing. It is true that at certain times men have been lynched for stealing cattle, but vigilance committees have always given the bulk of their attention to horse stealing, and many a neck-tie party has resulted from the theft of a single horse, while appropriations of hundreds of cattle have gone unpunished. There are even stories of men in search of stolen cattle being entertained by apparently reputable ranchmen and actually fed on portions of the stolen beast. In short, altogether "everything went," to use a slang expression, when "rustling" was in order. It is amazing that even to-day cattle stealing has not been entirely blotted out. The fear of the detective system of the Texas Live Stock Association, which we shall describe fully later on, has acted as a great detriment, but even now cattle are stolen under the most extraordinary conditions. A man is now languishing in jail for having stolen and shipped two car loads of branded cattle to the East St. Louis Stock Yards, and there are many other recent instances of equal audacity. Still, railroads and telegraphs have combined to increase the risks of stealing, and it is a matter of general congratulation to both the trade and the State that thieving is no longer known as "rustling," nor is the thief looked upon as a sharp man who has only been protecting his own interests and recouping himself from previous losses. Railroad shipping has developed new species of dishonesty against which the cattleman has to contend, but the much-abused fence, the more clear definition of highways and roads, and the placing of detectives and agents at shipping points and markets, have greatly reduced the opportunities for theft and the volume of business done in this way.

Prior to and even during the days in which "rustling" flourished, cattle stealing by Indians had to be guarded against. We have seen it stated that Indians always steal horses in preference to cattle, and, while this is doubtless correct, the fact remains that from time to time the Indians have developed a strong desire to stampede cattle and capture entire herds. Many instances might be given of this unfortunate habit, but we will content ourselves with a brief summary of the experience met with by a cowboy and described by Mr. C. C. Post. Two men, with an aggregate capital of five thousand dollars, located in the wild West with the hope of making a fortune at ranching. One of them, known as Phil, had had considerable experience with the Maxwells, and this experience he put up against the capital of his partner, who, evidently for the sake of concealing his identity, is spoken of in the narrative as Brown. The two men purchased four hundred head of Texas steers at eight dollars a head, a reasonable price for yearlings, and with these they started out in the direction of New Mexico in search of a suitable range. A wagon, a little ammunition and a few tools made up their outfit, and a few three-year-old ponies were taken along for obvious purposes.

They knew that there was less lawlessness and danger than reports indicated, but the more experienced man at least was well aware that the only way to insure a safe passage to their destination was to go well armed and prepared for emergencies. They were especially cautious about Indians, holding the theory, which every man who has herded cattle or lived in the West or Southwest naturally holds, namely, that the good, unfortunate and badly used Indian is as scarce as gold nuggets on the prairie. Their idea of educating the red man had at least the benefit of being practical and easily enforced, and in consequence good repeating rifles and reliable revolvers were added to the outfit.

They started out in the direction of the Pecos River, and, avoiding the Staked Plains, finally pitched camp not far from old Fort Stanton. Finding a good range unoccupied and unappropriated, they entered it according to law at the Government price of a dollar and a quarter an acre, and by taking up three hundred and twenty acres along the head waters of the creek, they secured control of a range large enough for operations ten times as large as those they contemplated. They started on their new life in the best of spirits, built a log house and a stockade, and settled down to a life, if not of actual

comfort, at least of interest and hope. There was an abundance of game, buffalo were frequently seen, and the young people found plenty to do to amuse themselves when work permitted.

Time went on, and after a year's feeding the cattle were worth a great deal more than they had been bought for, and could have been sold at a liberal profit. A buyer could have been found on the ground, but it was thought more advantageous to drive and ship to market, and arrangements were accordingly made for that purpose. Unfortunately, the step was delayed for a short time, and as a result there were very few cattle left to ship away at all. Phil was one day riding alone on the ranch, when he was suddenly met by his herd of steers on the dead run, followed by fifty Apache Indians. He had too much sense to attempt to withstand the raid single-handed, and turning in the direction of home, made his pony go at a speed it had never before attempted. Even at this gait he was in momentary danger, for the Indians had spotted him and were after him at full gallop. Several bullets flew past him, and to his horror he found that the Indians were armed with repeating rifles which they had captured in a recent raid. His pony was shot under him just as he got up to the ranch headquarters,

IN THE BRANDING PEN.

but he got to cover, and finding his partner Brown and a neighbor named Peters within, he explained the situation to them, and the three opened up a lively fire on the redskins. These were driven off, largely, doubtless, because they were less anxious for a fight than for the bunch of fat cattle, and the unfortunate ranchmen speedily collected together such neighbors as they could summon and set out to try and recover at least a few of the stolen herd.

They had no difficulty in locating a trail such as was necessarily made by four hundred steers and fifty or sixty Indians, and so resolute were the men that they followed it up close, regardless of the great danger they encountered. On the following day they sighted the stampeded herd with the Indians urging them forward, and they knew that the time for action had arrived. It was the practice of the Indians, in cases of this kind, to divide up the herd into sections and drive them to different distant hills where pursuit was almost impossible. To offset this idea and plan, the ranchmen's party made a long detour and got in front of the frightened steers and their feathered and painted drivers. About a fourth of the herd broke in the direction of the ambuscade selected, followed by some half a dozen of the savages. These six men learnt a lesson which only half of them had an opportunity of regretting, and the two or three which escaped the shots fired in rapid succession at them rode off at full gallop to rejoin their comrades, leaving the white men to get the demoralized cattle together, and at least save this section of their herd.

The next day they were joined by a party of twenty cowboys, who had followed up the pursuit, and an effort was made to regain a portion of the remaining missing animals. The strengthened band of white men pushed rapidly on the trail of the Indians, who were evidently traveling in the direction of Old Mexico, where further pursuit would have been hopeless. The Indians were finally located in camp about a mile ahead of them, and scouts being sent out, preparations were made for a general rush and an attempt to stampede the cattle, and thus secure some of them. A hand-to-hand fight followed, but the lay of the country was such that the white men were at great disadvantage, and their prospects of success were exceedingly small. On the third night a thunder-storm, with vivid lightning, demoralized the Indians and the cattle, and somewhat helped the rescuing party, although things had gone too far to help them much. Two days were spent hunting cattle, and, finally, about two hundred were recovered. Sixty or seventy of these bore the brand of our heroes, who, on their return home, found that they had altogether less than two hundred cattle left out of their original four hundred. The herd was too small to make it worth while to drive away, and the steers were accordingly sold on the spot for a trifle more money than the original outlay made by the young men.

Prior to this occurrence, the Indians harassed the cattlemen much nearer the center of civilization than the borderland between Old and New Mexico. We could fill a large-sized book with but a summary of the fights between cattlemen and redskin cattle thieves, but space forbids. A few lines in reference to "Texas Jack," the great Indian fighter, who rescued thousands of cattle, may not, however, be out of place. In early years this hero of the ranch was known as John B. Omohundro, though in later years the fact that this was his real name came to be forgotten. At the age of seven he ran away from home and shipped as "general utility" boy on a sailing vessel bound for Australia. This voyage proved so delightful to the youthful adventurer that he remained at sea until he had developed into a seaman before the mast, in which service he visited nearly all the countries of the world, but in 1858 was wrecked off the coast of Texas, and, after a hard struggle for life with the angry billows, was cast upon the shore near Corpus Christi.

After this experience, Jack resolved to remain a landsman until some desirable position should offer him for an easier life. He was not long idle, however, for occupation was readily found among the large cattle herders of Texas, which service soon introduced him to the wild life found only on the plains, and in which there was a congeniality and fascination peculiarly suited to his disposition. Strong, muscular, active and adventurous, Jack took to horseback riding with wonderful naturalness, and the pistol, knife, rifle and lasso came next to his hand by a process of gravitation which distinguishes the Texan cowboy from the free rovers of all other States. He, therefore, readily acquired great dexterity in the use of fire-arms, and became an expert horseman, which proved to be of excellent service to him afterward.

Jack was employed on a ranch in the Texas Pan Handle, near the border line of the Indian Territory, where Indian cattle thieves were accustomed to make periodical depredations. On this ranch were also many head of horses, raised chiefly for herding purposes, and these animals required constant watchfulness from the herders to prevent them from falling into the hands of covetous Indians. In fact, many cowboys were murdered by these pests of the ranch, so that the business of herder had become extremely hazardous in the Pan Handle section. When Jack entered upon the dangerous duty he expected trouble with the Indians, and was, therefore, prepared for it. Nor was he anywise surprised when, a few months after his engagement, a large body of redskins came down upon him and his partner, with whoop and weapons, intent upon capturing the horses under Jack's charge. But the Indians were received with a cordiality little expected. While his partner drove the horses away, Jack poured a deadly fire into the Indians, killing several, and thus checking pursuit. For this skillfull and effective resistance he was well rewarded by the owner of the stock. Afterward Jack made several cattle drives to Abilene, and became one of Texas' most renowned rancheros.

When the great Civil War was declared, and there was a mustering of Southern forces through the Southwest, Jack proffered his services to Gen. Floyd, by whom he was at once made "headquarters courier," and directly thereafter was promoted to be chief of scouts, under the celebrated cavalry Colonel, J. B. Stuart. He served in this capacity for several years, and became noted throughout the Confederacy. At the close of the hostilities Jack was employed as guide between the Colorado and

Rio Grande Rivers, and after pursuing this calling for several months made an extended tour through Kansas and Nebraska, for the purpose of so familiarizing himself with the country that he could competently guide parties through it.

In 1872 Jack was engaged as scout for the Government, and in the following summer had charge of four hundred Pawnees, who were engaged to operate against the Cheyennes. It was while thus employed that he made the acquaintance of Buffalo Bill, with whom he scouted a considerable time, and until the two became partners in an enterprise conceived by Ned Buntline. While Gen. Sheridan was organizing his campaign against the Northern Cheyennes Jack was employed as hunter for the army, in which capacity he developed remarkable skill in killing antelope, which abounded on the prairies of Western Kansas at that time. The method employed for killing this most wary and fleet of North American game was of a strategic rather than sensational character, the curiosity of the animal being largely relied upon for the purpose. During the Cheyenne war, and at the time of Custer's death, Jack was employed by the New York "HERALD" to carry dispatches from the scene of hostilities to the nearest point for transmission, and performed these duties with such satisfaction that he received many flattering notices of praise from that paper.

In the early part of 1880 Jack's health became much impaired, and he went to Colorado with the hope of benefiting his physical condition, and also his fortune, as the Leadville gold and silver discoveries were then promising large returns for small investments of capital and labor. But his anticipations were never realized, for in May he was attacked by pneumonia, a disease of great prevalence in the rarified atmosphere of that high altitude, and in June following he died. His wife, who was known on the stage as Mdlle. Morlacchi, was with him during his illness, and nursed him with all the care and tender attention that a devoted wife could give. Texas Jack was a true exponent of Western civilization; courageous, true to his friends, unfaltering in the line of duty, and resolute under all circumstances. His grave is among those whose adventurous spirits led them to the auriferous fields of Leadville only to lay down their hopes and burdens beside the still waters and peaceful fields of death; but it is kept green by friendly hands, while his name is ever fresh in the memory of companions who cherish the traits of his noble manhood.

No one knows how many ranches were broken up in the old days of cattle raising by the Indians, and the average Eastern man has but little idea of the trouble encountered by those who, in the early days, made a vigorous effort to earn a livelihood on the ranch, and who sometimes hit, but very often did not. The dishonesty of neighbors, both white and red, was one of the most serious and lasting drawbacks, which accounts for the fact that we have given to the subject an entire chapter, although a brief one, in this history.

CHAPTER V.

A Few Facts Concerning Texas Fever, Actual and Alleged.

WE have seen how the war and the consequent closing of markets paralyzed the cattle trade of Texas and the Southwest, and we have noted how the industry was hampered by "crowding" and fencing. We have also noted how cattle stealing became reduced to a science and how it interfered with legitimate business, ruined many ranchmen and impoverished a great many more.

There are two more serious handicaps against which the Texas cattleman has had to contend, one for more than a quarter of a century; the other for a shorter period. We refer to Texas fever and the lack of competitive markets. To the former we must now give some consideration, owing to its great influence on the trade. The loss from "Spanish," "Southern" or "Texas" fever, actual and imagined, has been very large, but the direct loss has been insignificant compared with the great injury which has resulted from exaggerated reports as to the character and extent of the disease. To the average cattleman of the Southwest the word "quarantine" conjures up all sorts of memories of annoyance, inconvenience and financial loss. Politicians talk freely of Mason and Dixon's line, and its separation of North and South; cattlemen talk rather of another line which has been arbitrarily drawn, and which condemns immense sections of the country to hardships which the Government deems inevitable, but which might, to a very large extent, be mitigated if more common sense were used as a leaven to severity and red tape. As to the question of what is Texas fever, the authorities differ so greatly that whatever side of the question one takes, some one is certain to arise to say that another one is the more correct.

One of the best descriptions of this disease, from what may be described as a Northern standpoint, was written about eight years ago by Prof. A. J. Murray, at one time a special veterinary inspector for the British and American Governments. Prof. Murray says that the disease is known by the name of Texas and Spanish fever, adding that it is peculiar, to a large extent, to the Southern part of the United States. He, however, points out that it has also occurred in Mexico and the West Indies, and that it differs from most other enzootic and other maladies, in the fact that it may be developed at a very great distance.

"The disease," he says, "may be developed in two ways among Northern cattle. First, by their coming in contact with Texas cattle, or passing over any place which is contaminated with their excreta or saliva. Dr. Detmers, who has made investigations into the nature of this disease, thinks that the contagion is contained in the saliva, and that Northern cattle contract the disease from the saliva which has been deposited on the pasture by the Southern cattle while grazing, and he also makes the statement that fæces and urine do not contain any infecting element. Dr. Detmers, however, states that the saliva derives its infecting element from the contents of the paunch, and to any one holding such an opinion the conclusion seems unavoidable that the fæces must contain the same infecting element as the paunch. He also denies that the urine contains any infecting element, and it is probable that in this statement he is correct. Dr. Detmers' statement as to the infectious qualities of saliva is well supported by the facts he has observed, but there is no evidence to show that the fæces is free from contagious properties. Secondly, Northern cattle contract the disease when taken to the South without coming in contact with Southern cattle. It appears probable, therefore, that there is some poisonous germ in the Southern pastures which produces fever, and that Southern animals apparently in good health have the power of excreting this poison from their systems, which may then contaminate the systems of Northern cattle; but in the latter it appears to have exhausted its power, as they are not capable of transmitting the disease to other Northern cattle when they are pastured with them, or kept in the same stable with them. It was generally thought by those who had had a large experience with this disease, that it could not be transmitted by inoculation. Dr. Salmon, however, states that he has transmitted the disease to a bull and cow by inoculating them with the pulp of the spleen. No cases have occurred in which any bad results have arisen from butchers or others being

inoculated with the blood of animals which have been killed while suffering from this disease—so it would appear from this fact that the blood is not possessed of any virulent or infecting properties. The non-infecting character of the blood when placed in contact with wounds, and the absence of the bacillus anthacis distinguished Southern fever from anthrax, though by some eminent writers it has been described as a form of anthrax."

According to Professor Murray, the most reliable symptoms of Texas fever are arched, or roached, back, head carried low; ears drooping; eyes staring, with a dull, glassy appearance; gait tremulous and staggering in the hindquarters. These are the external symptoms in a well-marked case of the disease, and represent the condition of the cattle in the illustration. Professor Gamgee states, as the result of his observations, that an elevated temperature is the earliest symptom of the disease, and that this elevated temperature exists for from four to six days before any other symptom of the disease can be observed. There is also dullness, want of appetite; in cows, a diminished secretion of milk; pulse quick and weak, generally from ninety to one hundred; quick, panting respiration. As the disease advances, the urine is dark-colored or bloody—this is a very characteristic symptom; the breath has a fetid odor, and there is evidence of great nervous prostration, the animal staggering on being made to move. Delirium and lethargy are also frequent in the latter stage of the disease. Those affected with delirium throw their heads about violently, and sometimes in doing so fracture their horns. Cows or oxen affected with coma will remain fixed in one position, and it is only by main force that they can be made to move.

The Bureau of Animal Industry, operated in connection with the Department of Agriculture at Washington, has gone into the question at great length, and has issued reports of immense volume dealing with the subject in its various phases, and setting up and knocking down a great number of theories. The idea of a quarantine line dividing North and South is based upon the idea that Texas fever is a purely local complaint or calamity, and that the disease invariably originates south of the line which separates the alleged infected region from the remainder of the country. Experiments have not proved that this is entirely the case, and the Bureau of Animal Industry records the case of a North Carolina cow whose blood was capable of producing Texas fever, although the animal had not seen a strictly Southern pasture for three years.

"Texas fever," says the eighth annual report of the bureau, "in the territory outside of the enzootic region, is the result of the distribution of ripe egg-laying ticks by cattle from the enzootic region. Hence, such cattle should not be allowed on uninfected territory during the warmer half of the year. It is also evident that during the same period all cars carrying Southern cattle contain a larger or smaller number of ticks, which have been dropped off during the journey, and which are ready to lay their eggs. The sweepings of such cars, wherever deposited, may give rise to a crop of young ticks, and these, when they have access to cattle, will produce the disease. Wherever Southern tick-bearing cattle are kept within twenty-five to thirty days after their departure from native fields, they are liable to infect such places, since it requires the period mentioned for the smaller ticks to ripen and drop off. But under special conditions even this period is too short, and the Southern cattle may remain dangerous a longer time. This would occur when such cattle remain in any one enclosure long enough (four to five weeks) for the progeny of the first ticks, which drop off, to appear on the same cattle.

"The above points are covered in the regulations of the Department of Agriculture concerning cattle transportation. These regulations insist on the complete isolation of cattle coming from the permanently infected territory, between March 1 and December 1 of each year, and on the proper disinfection of the litter and manure from such cattle during transportation. Furthermore, such cattle can only be transported into uninfected territory for immediate slaughter during the prescribed period. These regulations, if properly carried out, would prevent the appearance of Texas fever at any time in those areas north of the enzootic territory.

"The only question which now presents itself is the efficiency of the prescribed disinfection. It has been shown that the infection resides only in the cattle ticks and their eggs; hence the destruction of these is absolutely essential to make the disinfection of any value. In the present report this question has not been touched upon; therefore, pending the trial of various disinfectants which is now going on, any discussion or any suggestions are of little value.

"The harmlessness of Southern cattle after being deprived of the cattle tick brings up the very important question whether such cattle cannot by some means be freed from ticks, so that their transportation may go on without any restriction during the entire year. There are several ways in which experiments might be undertaken. Cattle might be subjected to disinfectant washes of various kinds, or else they might be run through disinfectant baths, which expose the whole body to the action of the liquid used. Such processes would require careful attention. The survival of a very few ticks might lead to serious consequences, since a single ripe tick averages about 2,000 eggs."

The same report goes on to recommend that in case "the ticks are found on the cattle they should be carefully removed and the cattle transferred at once to uninfected grounds. They should be repeatedly examined for ticks and all found destroyed. While the change of pasture and the removal of ticks may not prevent the attack nor cut short the disease after it has once shown itself, we feel certain that fewer animals will succumb to the disease. A single infection is sufficient to cause severe and prolonged disease, as is shown by the injection of infected blood; but the mortality seems to be lower than in natural exposures, where the infection is intensified with every additional tick."

Summarizing its experiments and its conclusions, the report defines Texas fever very much more concisely than is usually the case. It states that Texas fever is a disease of the blood, "characterized by the destruction of red corpuscles. The symptoms are partly due to the anæmia produced, partly to the large amount of debris in the blood, which is excreted with difficulty and which causes derangement of the organs occupied with its removal.

"(2). The destruction of the red corpuscles is due to a micro-organism or micro-parasite which lives within them. It belongs to the protozoa and passes through several distinct phases in the blood.

"(3). Cattle from the permanently infected territory, though otherwise healthy, carry the micro-parasite of Texas fever in their blood.

"(4). Texas fever may be produced in susceptible cattle by the direct inoculation of blood containing the micro-parasite.

"(5). Texas fever in nature is transmitted from cattle which come from the permanently infected territory to cattle outside of this territory by the cattle tick (Boophilus bovis).

"(6). The infection is carried by the progeny of the ticks, which mature on infected cattle, and is inoculated by them directly into the blood of susceptible cattle.

"(7). Sick natives may be a source of infection (when ticks are present).

"(8). Texas fever is more fatal to adult than to younger cattle.

"(9). Two mild attacks or one severe attack will probably prevent a subsequent fatal attack in every case.

"(10). Sheep, rabbits, guinea-pigs and pigeons are insusceptible to direct inoculation. (Other animals have not been tested.)

"(11). In the diagnosis of Texas fever, especially in the living animal, the blood should always be examined microscopically, if possible."

As already mentioned, much inconvenience and loss has been experienced by cattle raisers and feeders in consequence of precautions, necessary and otherwise, taken to prevent the spread of this much discussed fever. In 1891 the quarantined section was very distinctly defined by act of Congress, and in 1892 the Department of Agriculture issued a regulation declaring that splenetic, or Southern, fever existed among cattle in all the country lying east or south of a line commencing at the southwest corner of Belvedere County, Texas, on the Rio Grande River; thence running northerly along the western boundaries of Valverde and Crockett Counties to the northwest corner of Crockett County; thence easterly along the northern boundaries of Crockett and Schleicher Counties to the southeastern corner of Irion County; thence northerly along the eastern boundary of Irion County to the northeast corner of said county; thence northerly to the southern boundary of Coke County; thence northerly along the western boundary of Coke County to the southern boundary of Mitchell County; thence easterly to the southeast corner of Mitchell County; thence northerly along the western boundaries of Nolan and Fisher Counties to the southern boundary of Kent County; thence easterly along the southern boundary of Kent County to the southwestern corner of Stonewall County; thence northerly along the western boundary of Stonewall County to the southeastern corner of Dickens County; thence easterly

along the northern boundary of Stonewall County to the southwestern corner of Knox County; thence northerly along the western boundaries of Knox and Hardeman Counties to the Red River; thence northwesterly following the Red River to its point of intersection with the one hundredth meridian of longitude; thence northerly from said point of intersection along said one hundredth meridian to the southern boundary of the State of Kansas; thence easterly along the southern boundary of the State of Kansas to the northeast boundary of the Indian Territory; thence southerly along the eastern boundary of the Indian Territory to the southwest corner of the State of Missouri; thence easterly along the southern boundary of the State of Missouri to the Mississippi River; thence running southerly along the Mississippi River to the southwestern corner of the County of Lauderdale, State of Tennessee; thence running easterly, following the southern boundaries of the Counties of Lauderdale, Crockett, Gibson, Carroll, Benton, Perry, Lewis, Maury, Marshall, Bedford, Coffee, Grundy, Sequatchie, Hamilton, Meigs, McMinn and Monroe, State of Tennessee, to the eastern boundaries of Macon, Jackson, Transylvania and Henderson, State of North Carolina, to the southeast corner of the County of Buncombe, of said State; thence in a northeasterly direction, following the Blue Ridge Mountains, to the southwestern corner of the County of Madison, State of Virginia; thence easterly along the southern boundaries of the Counties of Madison, Culpepper and Stafford; thence northerly along the eastern boundary of Stafford County to the Potomac River; thence following the Potomac River southerly to the Chesapeake Bay; thence easterly along the southern boundary of the State of Maryland to the Atlantic Ocean. The same proclamation declared that between March 1 and December 1 no cattle could be transported from within the alleged infected area, which, of course, includes thousands of square miles where no cattle have ever been raised or grazed at all, to any portion of the country north or west of the line, except by rail for immediate slaughter. Even when shipped for slaughter, special regulations were laid down, including one calling for the labeling of all cars with a statement that they contained Southern cattle.

The regulations have been enforced with much more rigor than the average Federal or State enactment. The Inspectors of the Bureau of Animal Industry had a hard task before them in the work of inspection for which they were assigned. Thus, during the quarantine season of 1892, two and a half million cattle from the alleged infected district were inspected and kept separate from other cattle. Of this two and a half million, nearly seven hundred thousand were inspected at the quarantine pens at Chicago. More than four hundred and thirty thousand were similarly inspected at East St. Louis, and three hundred and fifty thousand at Kansas City. The number of car loads of cattle received from infected districts during the period was nearly one hundred thousand, Chicago heading the list with twenty-five thousand, and East St. Louis coming next with fifteen thousand. All this work resulted in the rejection of something less than a thousand head of cattle, showing that an immense amount of work was gone through with comparatively insignificant results.

Many of the leaders in the industry, including men who have given the subject of cattle and cattle diseases the most careful attention, believe that Texans are, to a great extent, the victims of a scare, and that the amount of disease throughout the South and Southwest has always been, and still is, very far smaller than sometimes imagined. The conditions under which the cattle of Texas, Arizona and the Indian Territory live is natural and healthy, and the long journeys through and across the plains does not seem to bear out the report of disease heard and recorded in the North. Texas cattle were driven through Missouri and adjoining States several years before the war, and in some cases the disease, then known as the "bloody murrain," got among the native cattle which came in contact with the Texas-bred animals, thus giving color to the theory that whatever Texas fever may be, it is a disease which is caught easily by animals which have been reared and grazed in more Northern climes. In consequence of difficulties arising from the disease, the cattle trails North gradually went further West, and the extremely long-horned cattle from Southern Texas began to cross the river in the vicinity of Leavenworth. Outbreaks of disease in this section led to further agitation against the cattle of the South, and at one time feeling was so high on the subject that the driving of cattle along the trail was of necessity temporarily abandoned.

After the war an immense number of cattle were shipped through Sedalia and other Western points, but again the outbreak of the disease caused so much hard feeling that in some cases armed

bodies of men prevented the passage of Texas cattle through their neighborhood. As a result of this, the more thinly settled districts of States west of Missouri were selected, and Baxter Springs, Kas., came into prominence as a shipping point of great importance. In 1867 the Kansas Legislature took up the question and established a quarantine line on the sixth principal meridian; and as a result of this Wellington, Wichita and Newton became prominent shipping points for what were known as through Texas cattle. In 1872, as very specifically explained by Cuthbert Powell in his interesting record, "a new line was drawn following the Arkansas River from Wichita west to the southwest corner of Rice County, thence north to the northwest corner of said county and east along the north line of said county to a point a little east of the southeast corner of Ellsworth County, thence north to a line parallel with the south line of said county to the southwest corner of said county, thence north along the west line of Osborne and Smith counties out of the State, taking in the Counties of Harvey, McPherson, Rice, Saline, Ottawa, Cloud, Republic, Mitchell, Jewell, Osborne and Smith, but leaving out Ellsworth, Lincoln and Russell, and Ellsworth became the main shipping point for 'through' Texas cattle that year."

ON THE RANGE.

This remained the quarantine line up to 1876, when other counties were taken in and kept exempt from Southern Texas cattle. The act that year started the quarantine line at the southeast corner of Sumner County, thence north along the west line of said county to a point a little north of the center of Kingman, thence west through Kingman, Pratt and Kiowa to the west line of Kiowa County, thence west along the west line of Edwards, Pawnee, Rush, Ellis and Rooks to the southeast corner of Phillips, thence west along the south line of Norton to the southeast corner of Decatur, thence north along the east line of said county to the north line of the State; the counties now being taken in being Sumner, Sedgwick, Reno, a part of Pratt, the whole of Stafford, Edwards, Pawnee, Rush, Barton, Ellsworth, Lincoln, Russell, Ellis, Rooks, Phillips and Norton, which were now exempt from "through" Texas cattle. By this act Wichita and Ellsworth were closed as shipping points for "through" Texas cattle, and Medicine Lodge, Caldwell and Dodge City became the head centers of the Texas cattle trade.

A year later the line was again forced west, being at the southeast corner of Comanche County, thence north along the west line of said county to the southeast corner of Hodgeman, thence west on the south line of said county for about fifteen miles, thence north to the north line of said county, thence west to the southwest corner of Ness County, thence north on the west line of said county to the northwest corner thereof, thence north on the west line of Ellis County to the southeast corner of Graham, thence west on the south line of said county to the southwest corner of said county, thence north to the southeast corner of Decatur County, thence north on the west line of said county to the

north line of the State. The new territory being taken in by this line included the counties of Harper, Kingman, Barber, the south half of Pratt, the whole of Comanche, Kiowa, Ness and Decatur, and "through" Texas cattle were shut out of them forever. Dodge City and Hunnewell now became the shipping points for "through" Texas cattle.

In 1879 another change was made in the line. It started at the same point as two years previously, but went west as far as Dodge City, and thence north to Ness County, proceeding to the southwest corner of Trigo County, and thence along the line between Trigo and Graham Counties to Decatur. In 1883 six counties were added, and Dodge City was closed as a shipping point. Hence, all southern herds, driven in a westerly direction, were shipped through Honeywell and Kiola, and the Texas travel was practically pushed out of Kansas. In 1885 the Kansas Legislature took the question up and passed a law prohibiting the driving of "through" Texas cattle through any county in the State during the quarantine period, which, like the Government regulation, extended through March 1 to December 1. In the meantime the Federal Government had commenced taking action, and from that time forward, although various changes have been made in the exact line of demarcation, Texas cattle have been legislated and quarantined against with a vigor which, while it has resulted in quieting the alarms of Northern breeders and dealers, has caused an unlimited amount of inconvenience to many of the large shippers. In 1893 Pecos County, Texas, was added to the infected area, and February 15 was named as the first day of danger and enforced precautions, instead of March 1, as formerly. Other slight changes have since been made.

Although in order to do so we have to depart from the regular chronological order, it is advisable at this point to place on record briefly the results of a series of investigations into Southern or Texas fever made by the Bureau of Animal Industry during the years 1883, 1884 and 1885. We do this in order that we may acquire at least an approximately definite idea concerning this mysterious and disastrous disease, or whatever the correct name for it may be. The agents of the bureau failed to locate very much fever in the Indian Territory. Owing to the promiscuous driving of cattle through the Cherokee and Creek countries little definite information was available. The bureau, however, came to the conclusion that the line of infection continued in a northwesterly direction from the northwest corner of the State of Arkansas to within twelve or fifteen miles of the Kansas State line, near Chetopa. The direction was then westward across the Cherokee country and half way across the Osage country, the imaginary line then turning to the southwest and crossing the lands of the Kiowas, Comanches and Apaches, to the Texas State line.

Reports indicated that long drives and close herding of cattle from the infected districts were exciting causes of the malady, and that large numbers of such animals sickened and died during the drives. An unlimited amount of space is, of course, given to Texas, which has for a quarter of a century and more been handicapped by the reputation of being the home of this fearfully and wonderfully described fever. The report points out that there was a doubt in the minds of many cattlemen whether Texas cattle are dangerous from all that section of the State in which cattle brought in from the Northern States contract acclimation fever. The opinions of a large number of stockmen are quoted and some of these we reproduce. Thus, Mr. J. V. Evans, of Grayson County, reported introducing one hundred and sixty graded cattle from the North, one-half of which died from Southern fever. Also, that in the summer of 1881 he moved six thousand head of cattle from Grayson, Hunt, Tarrant and Benton Counties to his ranch in Donnelly County with no disease resulting.

Mr. C. C. Slaughter, of Dallas County, drove seven thousand cattle in May and June, 1884, from his ranch in Dawson County to the Cheyenne and Arapahoe Reservation in the Indian Territory. They came in contact with a herd from the extreme south of the State, and two hundred of his seven thousand died of the fever.

Mr. J. T. Davis, of Colorado City, Mitchell County, bought twelve grade bulls in Kentucky in the spring of 1884, and took ten of them safely to his ranch sixty miles north of his home. The other two were taken to his Falls County ranch, and both died from Southern fever.

The Magnolia Cattle Company, with headquarters at the same city, imported two hundred and eighty-five bulls from Illinois to their ranches in Mitchell and Howard Counties, and lost but three in acclimation.

Mr. J. D. Merchant, of Callahan County, between the years 1873 and 1876, introduced a number of graded cattle into Benton County, and lost from thirty-three to fifty per cent.

The Matador Cattle Company, of Colorado City, drove four hundred half-breeds from their ranch in Motley and Cottle Counties to Gainesville, whence they were shipped North. The loss from fever was sixty.

Mr. Charles Goodnight, of Donnelly County, stated that a hundred cattle on his Armstrong County ranch were exposed to a trail over which fifteen hundred cattle had passed in the early summmer from Mason County. Thirty of the hundred died.

Other similar reports of this character are given, but the force of the argument seems to be lost by the fact that all deaths are attributed to Texas or Southern fever. As we have already mentioned, the too hasty removal of stock from one part of the country to another is very apt to result in heavy loss. This is the case frequently in districts where Texas fever has never been heard of. Mr. Norman J. Colman, who was at that time Commissioner of Agriculture, followed up the inquiries by a circular to Texas cattle owners. In this communication he called attention to the prohibition enactments of other States and Territories, and asked information on two specific points, in order that he could be governed in his actions in the matter. His first question related to the purchase of cattle from the north to the south line of Kansas, for feeding in Texas, and requested data as to numbers, location and loss from acclimization fever. The second question related to cases in which cattle from the eastern counties of Texas had been taken to a series of counties named; and if so, what were the results so far as disease was concerned?

The replies to this circular were numerous and varied. Some of them were so exceedingly pertinent and historically interesting that we give quotations and selections from them.

Messrs. H. H. Carmichael & Co., of Bandera, reported the purchase of five high grade Durham cattle in Pennsylvania, in August, 1882. They were turned out on the range with native cattle, and all had lived and had done well.

Mr. Henry Terrell, San Antonio: I have purchased yearly in Ohio and Michigan blooded cattle, registered herd-book stock, and had the same shipped to my ranch near this city, and have given especial attention to the so-called Texas cattle fever. In shipping my fine stock, I have had stalls made in the car, had a careful man in charge, provided barrels of water and an abundance of feed to last. The stock had not been allowed to be taken from the cars from place of shipment until their arrival in this city. On their arrival here they have been as carefully attended to as possible, no labor or expense being spared to save them. With all this care I have been able to reduce the loss to less than any other person in the business whose experience I know. My loss has averaged about twenty per cent. All stock imported have an acclimating fever, horses as well as cattle, but the percentage of loss in shipping horses from the North is only about five per cent.

Messrs. J. O. & T. Dewees, San Antonio: Our ranch is situated in Wilson, Karnes and Atascosa Counties. We purchased three bulls in the year 1876, shipped them from Kentucky, and turned them in with our Texas cattle. None of them died from fever. They lived and did well for several years. We have handled a great many cattle from different parts of Texas and other States. We have brought cattle from Louisiana, Mississippi, Mexico, and from the coast of Texas to the eastern line, and from several counties northwest, and mixed them with our cattle on our ranch, and have never known of any disease to trouble them. We have never had such a disease as Texas or splenic fever. We have never lost any cattle except from black leg or starvation. Our opinion is that the Texas fever is unknown in our native Texas cattle, and we do not believe they are capable of imparting a disease they do not have.

Mr. H. B. Stoddard, Bryan: I have driven and shipped three thousand to four thousand head of cattle each year for the past eight years from this county to Caldwell, Kan., and Fort Dodge. No complaint ever reached me as to the cattle being diseased, or communicating disease to other cattle.

Mr. W. S. Ikard, Henrietta: I have been buying cattle from Iowa, Illinois and Missouri for several years. About eight years ago I bought ten Hereford bulls from Mr. Miller, Beecher, in Illinois. Seven died, but I think this was caused by driving through. It might have been the result of fever. In 1874 I brought ten Durhams from Kentucky; lost none. In 1883 I brought two Hereford bulls from

Missouri and nine Durhams, and lost none. In 1884 I bought twenty-six Hereford bulls from Low Hastings, of Iowa, and two half Highland Scotch, none of which died. I don't believe there is any danger here.

Mr. R. H. Overall, Coleman: Referring to your circular of the 18th of April, I have to say that in January, 1884, I bought of an agent of Messrs. A. A. Crane & Co., Henry County, Ill., twenty-five cross-bred Hereford and Durham bulls. They were immediately transported to my ranch in this county; they arrived about the 20th of the month; were turned into feed-pens with native bulls and other cattle, fed on milled-hay and sorghum (sugar cane) until the 1st of April, when they were turned loose in a pasture of twenty-five thousand acres, with nearly three thousand head of cattle. Up to the time of turning them loose I saw them two or three times every day. I am confident I never saw a healthier or more thrifty bunch of cattle. Several months after this my hands reported two of them dead. On inspecting them, one was found to have been gored by a bull, the other was so decomposed that I could not make a critical examination of him. These were all the losses I met with during the season. If any of these cattle were affected with Texas or splenic fever they all recovered, as we found none other than the above described dead, and saw none sick.

Mr. J. G. Witherspoon, Gainesville: In answer to the first question asked by you through the papers, I will say that we bought and put on our ranch in Hardeman County, seventy-three Hereford and shorthorn bulls this spring. We were encouraged to do this from the fact that our neighboring ranchmen, Forsyth Cattle Company, have been buying bulls from the same parties we bought from in the State of Illinois for two or three years, and they have lost very few, if any, from Texas or acclimatizing fever. There have been no cattle turned in our range from Southern Texas, so we cannot answer your second question, but will say that we lost cattle in 1883 from driving on the trail behind Southern cattle, and from contact with them, with the disease known as Texas fever. During last season our neighbors in Cottle County lost cattle in the same way, and for this reason we would be afraid to turn Southern or extreme Southwestern cattle among ours on the range. However, we believe that no cattle raised or held one year north of the Texas Pacific, or west of the Houston and Texas Central Railroad, are liable to give the disease known as Texas fever to our cattle (in Pan Handle), or to cattle in the State of Kansas, or in any of the Northern Territories.

Mr. S. Witherspoon, Gainesville: We ranch in Hardeman County. In answer to your first question, I will say that we bought seventy-five Hereford bulls from Mr. Gregory, of Chicago. The bulls were bred by Mr. G. on his farm near Chicago; were shipped to this county (Cook) in December, and carried from here to the ranch in April last. None of them have died so far. Our neighbors have been buying blooded bulls from the Eastern States, principally from Illinois, Missouri, Kentucky and Tennessee, and have had good luck with them. However, I wish to say that I do not believe that acclimatization fever has anything to do with it, or is in any way connected with Texas or splenic fever. Any cattle transferred from one county to another, and more particularly from a Northern to a Southern county, are liable to die with acclimatization fever, while no cattle were ever known to die of Texas or splenic fever unless they have come in contact with Southern or Coast cattle, or have been driven across or on the trail with them. We have never known cattle from our country (Northwest Texas) to give Texas fever. We never had Southern cattle thrown with ours on the range, but have had cattle to die from contact with Southern herds on the trail.

Mr. Joseph Clymer, Sherman: I have to say that I purchased, in the fall of 1883, eighteen head of thoroughbred shorthorn cattle in Kentucky; transported the same to this county by steamboat and railroad. In the lot I had thirteen heifers and five bulls; sold four bulls and one heifer. I still own twelve heifers and one bull. All the heifers have been bred and now have calves. None ever showed any symptoms of disease whatever. Our prairie grass has given them a rapid growth.

Mr. J. W. Colston, Gertrudes: My attention has been called to a circular issued by you, asking information regarding the so-called Texas fever within the borders of certain counties enumerated. As Secretary of the Young County Cattle Raisers' Association, I will answer for the Counties of Young, Jack, and the southern part of Archer and Clay. First. There have been numerous importations of blooded stock, including Durhams, Herefords, Polled Angus, Holsteins and Jerseys, to the counties specified by me, and while some showed slight symptoms of acclimatization fever the majority went

through without any visible alteration, and, so far as my information reaches, none have died. Second. There has been no disease, within the bounds specified by me, caused by the introduction of cattle from the western counties of Texas. But there was a very peculiar and fatal disease prevailing last fall and winter, and by well-posted parties it was attributed to the introduction of cattle from Louisiana, Florida and Mississippi. Lastly. I think that a careful and unbiased investigation of the so-called Texas or splenic fever, will establish the fact that it is confined principally to the Gulf Coast and adjoining counties, and is as prevalent in the other Gulf States as in Texas; and, furthermore, that the Northern and Northwestern part of Texas is as free from the disease as any other of the Northern States or Territories.

Mr. A. H. Pierce, Rancho Grande: I have been as familiar and probably as well acquainted over Texas as any man in it, having imported as many as eighty Northern bulls from Kentucky and Missouri at one time, from which I lost from thirty-three to fifty per cent of every lot brought in. Will state that Northern bulls die oftener with us than in any of the counties named in your circular, and our cattle driven from Eastern Texas to the counties named do not contract disease at all, and cattle from those counties do not die when brought to us. Every man has his own theory as regards Texas fever. I know there is such a disease, but not to such an extent as reported; the cry is raised for self-interest, and it will regulate itself in the next eighteen months.* Texas fever is caused, beyond a doubt, from handling stock badly late in the season, when the weather is too hot and water scarce. If they do not have it this season they need not fear it again for the next five years, as the cattle going North this season are starting later, by sixty days, than usual.

Mr. H. Seligson, Galveston: Referring to your circular addressed to cattle owners in Texas, I beg to state that I have been raising cattle in Texas for thirty-five years; have resided here forty-six years. I know, from my own knowledge, that six years prior to 1861, when from thirty thousand to sixty thousand cattle were driven to Kansas each year, we heard nothing of Texas fever. So long as they were driven through we heard very little of it, but so soon as they were shipped by rail, and crowded into cars in hot weather, they became fevered and, no doubt in some instances, infected others. But a great deal of this hue and cry of Texas fever is founded on the fact that Kansas and the Territories are well stocked with our cattle, and they do not wish competition from Texas any longer. They know this to be the great breeding grounds, averaging ninety per cent of calves as against sixty per cent with them. Our people in the Pan Handle in Texas, who now have their ranges fully stocked, have proclaimed a quarantine against Southwestern cattle. They average about seventy per cent of calves, so they, too, realize that they can not compete as a breeding ground, and they, too, proclaim their independence of law, right and justice.

Mr. A. P. Bush, Colorado: I have not bought any bulls from north of the south line of Kansas, but many have been brought to this section of the country during this season. McWilliams & King, out of thirty-two bought in February, have lost one (located in the southern part of the county). M. Z. Smisson, in Tom Green County, lost three out of thirty-eight, and others have had more or less losses, but as far as my observation and investigation have gone, bulls brought here at a season of the spring when they can get fresh and tender grass have shown lighter losses than when brought during the winter. The bulls that have died have, as a rule, not come in contact with native cattle. I do not know of any cattle brought from Eastern Texas and turned loose in the counties named in your circular.

Mr. W. H. Somerville, Fort Worth: Referring to your circular addressed to Texas cattlemen, we have pleasure in replying as follows: In 1883, and again in 1884, this company (The Matador Land and Cattle Company) purchased in Kansas between three hundred and four hundred head each year of bulls—Durham and Hereford—from three-fourth grade to pure blood, pedigree stock. In both cases these were driven from Kansas through the Pan Handle during the month of May, and were turned out on the company's range (embracing portions of Motley, Cottle, Dickens and Floyd Counties), between the 1st and 15th of June. We have naturally watched their progress carefully, and have never yet

* It is to be regretted that the wish, which was father to this thought, was not realized. "It" has not yet regulated itself though six times eighteen months have passed.

known one to be sick or diseased; indeed, to the best of our knowledge, all, with the exception of three that were killed by accidents, are now living and in good condition. We are repeating the same practice this year with three hundred and fifty head, being satisfied of its safety.

Mr. B. F. Buzard, Uvalde: Thoroughbred and high grade shorthorns and Hereford bulls have been brought from north of the south line of Kansas into this and adjoining counties for the past three years. In October, 1884, Searight and Carothers brought about fifty head from Iowa to their ranches in Zavala and Kinney Counties, and the previous year about the same number, with no loss from fever. Dr. Johnson brought several car loads from Kentucky to his ranch on the Frio River, in this county, and I have not heard of his having lost any. Mr. O'Neil brought three fine thoroughbred shorthorn bulls from Kentucky four years ago, which are yet doing good service on his range. Many other cattlemen have brought in good stock with like result. Thousands of cattle from Eastern Texas have been driven into Uvalde and adjoining counties during the spring and summer months, and allowed to pasture on the same range with cattle native to these counties without loss to either, all being alike very healthy.

Mr. A. S. Mercer, Cheyenne: With pleasure I note your remarks about the Texas dead-line, and when our folks properly understand this matter North Texas cattle will be admitted into Northern ranges; but there is a world of educating to be done. To show you what my views on this subject are I inclose you an editorial from the "JOURNAL" of April 3. I am familiar with the whole of Northwest Texas and know whereof I speak. The editorial enclosed was as follows: "'The TEXAS LIVE STOCK JOURNAL' seems to think that a large number of Texas cattle will be admitted into Kansas by the Sanitary Board after a few days' detention on the border, in company with native cattle put into the herds, to determine whether there is a fever germ among them. We think the olive branch of peace that is being held out to Texas drovers is deceptive and should not be borne aloft. There is no doubt in our mind as to the fact that all native cattle north of the Upper Cross Timbers in Texas are as free from splenic fever as are those of Colorado and Kansas. But the herds made up in those sections are so frequently mixed with Southern Texas cattle previously brought in, that it is very difficult to get a clean bill of health. Experience on the border shows beyond any question that there is no definite time between exposure to and development of fever. Ninety days is as short a time as is absolutely safe. It has been known to develop at any and every period between ten and ninety days. Hence any such test as above mentioned is valueless, except at the end of the ninety days, and the Sanitary Board is not likely to make any rule that has an uncertain sound among the people who have forced the quarantine measures and to whom the board is responsible.

"The people owning the cattle in the district where the fever is known to germinate have a right to know exactly what to expect, and should not be buoyed up by false or deceptive utterances that might lead them into trouble. If the gentlemen from the Coast know their cattle can not come in under ninety days, they will be loth to drive from Wichita Falls or Harold and take the chances of selling their cattle in the autumn at such figures as those who have range and feed may choose to offer. The fact is, that all cattle from what may be termed the infected district will be religiously kept out until the law has been fully enforced. The line of infection is the difficult thing to establish, but when once settled it will be a 'sure enough' dead-line.

"The western or northwestern edge of the Upper Cross Timbers may be taken as a safe line, so far as the North is concerned. There are few counties south and east of this that would probably be safe sections to receive cattle from, but the line would be crooked and uncertain. The question can be determined by honest care, and the people of Texas are as much interested in the matter as those of the North. Any county in North Texas where the native cattle take the fever from coming in contact with Southern Texas cattle is a safe country from which to receive native cattle. And the reverse proposition is true. It is a little difficult to get an exact or positive line, just as it is difficult to determine the point where two nicely shaded lines on a picture blend. There is a sort of middle ground in the picture where the colors can not be distinguished. So there is a neutral strip on this line of infection. But, the line as laid down above is on the side of absolute safety. When properly adjusted there will be a safe inlet for all the steers from North Texas, and that section is really in the same boat with Kansas and Colorado.

"Instead of a misunderstanding and pulling apart, the people of the South and the North want to enter upon a concert of action that will develop all the facts about splenic fever, and enable them to shape their action as to bring about trade and market relations to their mutual interests. Self-preservation is the first law of nature, and the Texan is as quick to assert it as the citizen of Kansas or any other country. But a knowledge of all the facts will aid all those in interest."

Enough space has now been devoted to the theories with reference to Texas fever, and we will go back to the period subsequent to the war to see how fever and the fear of it came well nigh completing the ruin of an industry which had already been torn in pieces by the war and by the closing of markets against its product. Mr. McCoy, still harping on Abilene, goes into the fever question at considerable length, and has a great deal of fun at the expense of the alleged scientific investigators. One of his illustrations shows three antiquated individuals with wide-open eyes scrutinizing a billygoat. We are not quite sure from the context whether our good friend wishes to suggest that the experts did not know a goat from a steer, but it is evident from some of his remarks that his opinion concerning their wisdom was based upon some such assumption. Another of his cartoons illustrates a number of beefy-looking

RANCH SCENE NEAR WEATHERFORD, TEXAS.

individuals in council, with horns of various length shooting out of the portions of their head where the brains ought to have been but evidently wern't. In speaking of the first effects of the fever, he narrates the case of a herd of eight hundred very choice cattle which arrived at Abilene in the spring of 1868. They were a very choice selection and were put on the best grazing grounds of Kansas pending shipment. Two hundred and twenty-four of them, including the very best in the bunch, were purchased by an Illinois drover, who weighed them in the yards and found that they averaged 1,228 pounds each, a splendid showing for a quarter of a century ago, when the industry was in such an exceptionally depressed condition. The fate of the shipment was tragic. There was no sale for them in Chicago, owing to the fever scare, and they had to be reloaded and shipped on to Buffalo, N. Y. The net return for the shipment was $1,468, or about six thousand dollars less than expected.

This heart-breaking loss was caused by the sudden prejudice which had sprung up against Texas cattle, resulting from the excitement caused by the discovery of the existence of Spanish fever, which was spoken of in bated breath much as health commissioners talk of cholera and typhus. A panic naturally resulted from this craze, for it was nothing more or less. To get cattle out of Texas was one of the great ideas of some of those who were cattle poor. During the hottest weather, when the danger

was the greatest, calves, cows and steers were shipped to grazing grounds of Kansas, Illinois, Missouri and other States, and turned out to graze. If the idea was to flee from the wrath, or the fever, to come, a worse plan could not have been devised. Hurried through during a season of extreme heat, and run down in strength and flesh in consequence, all latent disease was developed, and there can be no doubt that a great deal of infection was spread. Cattle disease of every character in every part of the country was attributed to Texas, and the adage about giving a dog a bad name and hanging it had another practical and ocular demonstration of its accuracy.

Then there arose philosophers in every nook and corner, and every one began to discuss Texas fever, its causes, its cures, its origin and its development. The Illinois Agricultural Society appointed a committee of three to investigate the "plague" and, if possible, check it. Then New York stepped in and established a quarantine against all cattle from the West and Northwest, the result of which was a good case of the biter bit. In protecting itself against Texas, Illinois had opened a valve which injured it immensely, and allowed a great prospect of wealth to escape. Hurriedly a convention of experts was summoned by the Governor of Illinois, and all sorts of nonsense was talked by the experts whom Mr. McCoy lampoons so freely. The three principal theories advanced have all of them been since discredited; and, as some instance of the injustice of the convention and of its make-up, the fact may be mentioned that Texas, the most interested State of all, was unrepresented.

During the summer of 1868 the Federal Government took the matter up and further theories were advanced, all of them more or less wide of the mark. The peculiar characteristic of the fever, specially noted at that time, was that its presence was scarcely ever perceptible to the casual observer. Also, that while it did little or no harm to the Texas cattle themselves, it was fatal to cattle with whom such steers came in contact, and more especially with high grade and Northern beasts. The symptoms generally noted among shorthorns, grazing over and resting upon pastures where herds of infected cattle had been fed, was a refusal to eat and drink. The animal became stupid, inclined to stand or lie in the fence corners. "His head will droop below its natural position, his ears will lop down beside his head, his eyes will become nearly fixed, and a wild, glaring stare will be observed, whilst from his nostrils or mouth will constantly drop a whitish, ropy slobber resembling excessive salivary secretion. The animal's coat of hair will stand up on end or turn forward, presenting a rough, unthrifty appearance, whilst his back will become arched. Frequent urinary discharges will occur, presenting the appearance to the casual observer of pure blood; but rare evacuation of the bowels will occur, and those will be very hard and dry. The animal will become intensely hot and suffer great pain, and when near dissolution will often bellow piercing shrieks, expressive of the racking pain endured. Sometimes they will plunge about wildly for a few moments and then suddenly fall down and expire instantly."—(*McCoy.*)

It was observed at that time that one shorthorn would not take the disease from another, and various other peculiar and apparently miraculous ideas permeated the country. He would be a wise man who could estimate the loss to the trade during the year 1868 alone. Cattle sold in some cases at figures less than the shipping rates, and all sorts of losses were incurred.

The great difficulty in selling caused the Abilene people to determine upon a series of public sales, and, in order to advertise these, it was decided to load up a car with live buffalo and send it to various points, with bills of the sale attached to the cars. In order to do this it was necessary to first catch the buffalo, and a good deal of fun resulted. Some Texas cowboys, aided by expert Spanish lassoers, started on a chase after the then rapidly disappearing buffalo. The first old bull discovered was pursued and lassoed. His wrath, we are told, became terrific, and the only way he could be handled was to adopt the pl[illegible]of the Spanish bull fighter and lure the animal to the cattle car by means of stratagem. Finally he was thrown, his legs securely tied, and then he was hauled into the car by aid of block and tackle. Ten were captured altogether in this way, but only three were got successfully to the cars. As an advertising device the scheme was a good one, but the returns from the sale do not appear to have been exceptionally great.

Then followed an immense amount of trouble in the shipment of cattle. Contracts were canceled and the railroads accused of acting in bad faith, Mr. McCoy being especially severe on the Kansas Pacific Company and its St. Louis offices. While this trouble was being encountered the Illinois

Legislature met, and the usual legislation in a panic followed. A bill was introduced prohibiting the introduction of Texas cattle into the State of Illinois. The bill was a very stringent one, and really involved the shutting out of longhorn cattle of all kinds. No quarantine period was named, the bill being absolute in every respect and pitiless in its severity. It even went so far as to prevent the hauling of southern cattle through the State, and this, in consequence of the size of Illinois and its intimate relations with the leading railroads, meant the annihilation of the Texas cattle industry altogether.

The fight was a long and tedious one, and, if Mr. McCoy was correctly informed, the measure was kept from going before the proper committee by all kinds of devices. Texas had a few friends even in Illinois during this scare period, and these managed to arrange so that the clerk would leave the manuscript of the bill in some out-of-the-way place when the committee left. At another time festivities were in order, and a quorum was by that means broken.

But at last it came to be considered, and it was adopted, subject to an amendment permitting the introduction of Texas, or Southern, cattle under certain conditions. The total prohibition party were chagrined at the amendment, and all sorts of delays and fights followed. Finally, the bill went through with a proviso that it should not apply to wintered Texas cattle, and was, of course, rendered valueless from one point of view, and harmless from another. The following spring almost all cattle offered for sale for Eastern markets had been "wintered," and certificates were forthcoming, under seal, showing that every beast so offered had been duly wintered, and was hence exempt from the law. The amendment referred to not only took the sting out of the bill, but even gave an impetus to the cattle business, and the spring of 1869 found more Illinois buyers at the various shipping points in Southern Kansas than ever before. A drive of one hundred and fifty thousand cattle was announced early in the spring at Abilene, and prices ruled much higher. The same difficulty was encountered with the railroad authorities, and the celebrated fight between Abilene and Brookfield, the latter described as a railroad town exclusively, commenced. Business certainly became better, and when the sixties went out prospects were a great deal brighter, and there was every hope of better success in the future.

As in quoting from Mr. McCoy we have given considerable prominence to the Abilene trade, it may not be out of place to record his theory as to the killing of that town as a cattle shipping point. "The year 1871," he says, "was the last one in which the cattle business was done at Abilene. The trade was driven away by the schemes and concerted actions of a trio of office-seekers. In the year 1868 Abilene was visited by a brace of town-site seekers, forerunners of a band of ministering angels who came from a far-off land. Finding the proprietors of Abilene in selling humor, they were not long in deciding to purchase and in closing the contract for the entire site." Then follow charges of blackmail and other insinuations, with a record that the cattle trade was antagonized, and drovers turned their herds to other points farther West on the Kansas Pacific Road or on the Santa Fe. In 1872 an effort was made to get back the cattle trade, but it was too late, and the glory of the shipping point had, Mr. McCoy tells us, departed forever. At the same time Winfield, Wichita, Dodge City and other places came into prominence as shipping points, and the glory of Abilene was dimmed. But whatever may have been the contributory causes of the closing of the stock yards at this point, or to the loss of the heavy Texas business, there can be no doubt that the Texas fever scare started the downward tendency, and either caused the disaster or made it difficult to avert it.

Perhaps the most unfortunate result of the immense amount of discussion on Texas fever, and the very elaborate precautions taken to prevent its spread, is the influence on the export cattle trade. In foreign countries, and especially in England and Germany, there is a strong political or trade party objecting in every way to the importation of beef products, and more especially of live cattle. In the Old World one of the great questions of the day is the decadence of agriculture, and in this connection the importation of live cattle has always been bitterly opposed. No stronger argument for exclusion can be furnished the agricultural protectionists of the Old World than the quarantine regulations so freely advertised in the new one. Just as this chapter is completed, Germany has shut her gates against American beef. Politicians say this is tariff retaliation; the Germans say it is self-defense against that terrible bugaboo, Texas fever. It was about the end of October, 1894, when there came the formal notification to the Secretary of State by the German Ambassador, that the further importation of

fresh beef and cattle from the United States into Germany had been prohibited by his Government. Regarding cargoes then afloat, Baron von Saurma-Jetsch added that exports from this side up to October 28 would be admitted, but only on condition of being slaughtered directly on landing. Whatever might be behind this, the ostensible reason given for so sudden an action was the fact that in two shipments from New York the Texas fever had been introduced. This was also news to the Department of State and to merchants generally, as no reports had been received from Germany, or from any other country, indicating that this disease could have recently been exported from the United States, and the note of the German Ambassador was the first intimation that his countrymen had any complaint to make.

Several papers commented on this international slap in the face as a serious blow to an important industry. But as soon as the first annoyance passed over it was seen that there was very much of a storm in a tea-pot, and that the loss of the German market to American beef-producers was hardly worth talking about. Germany took no live cattle from the United States until 1878, when that empire received 1171 head, valued at $87,648. During the year 1891 Germany received from the United States its largest number of cattle, 5223 head, valued at $427,565. In 1893 Germany only received four hundred and nineteen head, valued at forty-one thousand dollars. Thus far, in 1894, she had received 3069 head, valued at $285,792. Germany took no fresh beef from the United States until 1887, when it took 9398 pounds, and in 1894 all Germany took of fresh beef from the United States was 4066 pounds, valued at eight hundred dollars. In view of the above facts, Secretary Morton very sensibly replied to questions as to what he was going to do about it, that he did not think it worth while to exploit or magnify as a matter of any importance the loss of the German market to American cattle and meat producers.

Still more recently, Denmark has gone out of its way to exclude American cattle from its ports, the usual excuse of Texas fever being made. In point of size and population Denmark is an exceedingly insignificant country, and the quantity of cattle it has imported from this country is too small for consideration. It is generally felt that the action of Germany was purely vindictive, and the result of annoyance at the action of Congress on the tariff question. It is also argued by diplomatists that the action of Denmark is really sympathetic with Germany, whose Government went out of its way to influence its little Northern neighbor. Unfortunately the action of other countries which have, still more recently, excluded American cattle, is much more serious.

The exportation of meat from the United States commenced several years before Texas fever was born or thought of, to use a somewhat hackneyed but not inappropriate phrase. Salted meats and tallow had been shipped out of this country to foreign climes for more than half a century. Early in the fifties Texas and Florida cattle began to be shipped in considerable numbers to the West India Islands. These were not high grade in character, and the average value was less than eighteen dollars. After the war shipments of cattle on a comprehensive scale commenced to Great Britain. Owing to the universal stall-feeding of cattle in that country, it was obviously useless to ship light or lean cattle across the Atlantic, and the heaviest steers were almost invariably selected for the purpose. It is just seventeen years since the first shipment of beef in refrigerator ships to Europe commenced. The value of fresh beef thus shipped averaged five million dollars a year for the first three years, and the average was more than doubled in 1884 and 1885. There were fluctuations in the amount shipped for the following five years, but 1891 saw another distinct increase, the figures running up to fifteen millions.

The shipments of salted or cured beef have fluctuated in the most remarkable manner during the last quarter of a century. In 1871 the value of the export was double that of 1870, while the total for 1872 showed an equally marked falling off. In 1875 there was another marked increase, the value of the meat thus exported exceeding four millions. This figure was not exceeded until 1890, when the five-million mark was reached and passed.

Twenty-seven thousand head of live cattle were exported in 1870, the value being placed at $439,987. These figures were rather more than doubled in 1874, but it was not until 1879 that anything like a boom in this business took place. In that year 136,720 head of cattle were exported, their value exceeding eight millions. In the two following years the average was forty per cent better in numbers and fifty or sixty per cent better in values. In 1882 and 1883 there was a heavy falling off, amounting

to fully eighty per cent in the number and fifty per cent in value. In 1884 the loss in numbers was more than regained, and the value of cattle exported approximated eighteen millions. Then followed four years of lighter shipments, with another favorable turn in 1889. In 1890 and 1891 the export business was given a great impetus, the number of cattle shipped abroad each year being nearly four hundred thousand, and the valuation about thirty million dollars.

One thing is certain about these foreign shipments, and that is, that while there is a great deal of profit made, the cattle raiser gets the worst end of the deal, and is not given even a decent percentage of the gain. A thoroughly competent authority points out that while it is not easy to state the cost of exporting to the actual dollar, it is easy to approximate the amount closely. The railway charges from Chicago to the different seaports average about twenty-eight cents per hundred pounds. The expenses en route will average about one dollar per head. Ropes and buckets for use on shipboard will average fifteen cents per head. Feed and hay for the voyage will cost about three dollars, and good attendance of the cattle cannot be expected for less than seventy-five cents per head, the wages of the attendants averaging seventy-five to one hundred dollars per trip for good, experienced men. Insurance costs about one dollar per head, and the steamship companies charge from seven to fourteen dollars for ocean carriage, the rate of freight fluctuating from about thirty shillings to sixty shillings per head. The English salesman will charge about one dollar and twenty-five cents for selling each beast. These are the principal items of expenditure. To make the matter clear, we will show in a general way what a one thousand three hundred pound steer, bought in Chicago at four cents per pound, would cost before it reaches the wholesale butcher's hands in England:

Cost in Chicago	$52 00
Railroad charges	3 64
Expenses en route from Chicago	1 00
Ropes, buckets, etc	15
Feed for ocean voyage	3 00
Attendance	75
Insurance	1 00
Ocean freight at forty-five shillings	10 80
Salesman's commission	1 25
Total	$73 59

In round figures, about seventy-five dollars, or twenty-two dollars more than the first cost of the beef in Chicago. The steamship companies supply nothing but the space and the water for the cattle, the ships being fitted up and the animals loaded under the supervision of officials of the Bureau of Animal Industry of the United States. Each beast is allowed a space two feet six inches wide on the top deck and two feet eight inches wide on the lower decks. The quotation in England now is about ten and a half cents per pound, sinking the offal; which means so much per pound for the dressed beef, with everything else, paunch, intestines, hide, feet, etc., thrown in to the buyer. The range of prices in 1893, for finest American cattle, was nine to thirteen cents, the average being about eleven and a half cents. This certainly shows a good profit to cattle shippers, and should justify higher prices for exceptionally good steers on the hoof.

WAITING AT THE FOUNTAIN.—From Photo by Ragsdale, San Angelo, Texas.

CHAPTER VI.

From Panic to Boom, with Extremes of Prices in Both Directions.

THUS through crime and tribulation the Texas cattle trade survived and advanced until it entered into what we have spoken of as the "transition period." By this we mean the years during which the trade emerged from the approximate bankruptcy of the years of the war and immediately after it, to the much greater prosperity of the later seventies, and the ultimate boom and inflation of the earlier eighties. The following figures, showing the number of cattle in the annual Texas drives, for a period of fifteen years, speak very eloquently of the conditions of that period, and of the building up of what looked at one time as promising to be one of the most profitable callings under the sun. The official figures as to the Texas cattle drives for the years mentioned are as follows:

1866 260,000	1871 600,000	1876 321,928
1867 35,000	1872 350,000	1877 201,000
1868 75,000	1873 404,000	1878 265,649
1869 350,000	1874 166,000	1879 250,927
1870 350,000	1875 151,618	1880 394,784

These figures, of course, deal only with the actual drives, and are not so much an index of the trade done during that period as of the habits and customs of the cattlemen. The extent of the trade can be better gleaned from the fact that in 1870 Chicago received five hundred and thirty thousand head of cattle, which number was increased almost to a million in 1875, and to about one million four hundred thousand in 1880. During the same decade the receipts at St. Louis increased from two hundred and one thousand to four hundred and twenty-four thousand. Kansas City practically came into existence as a cattle market and shipping point during the seventies, opening up that period with a record of but twenty-one thousand head of cattle, and closing it with about a quarter of a million.

During this same transition period the receipts of the principal Eastern cities increased from seven hundred and one thousand in 1870, to more than a million and a quarter in 1880. Baltimore showed the smallest gain and New York the largest, the increase in the latter city being more than three hundred and twenty thousand head. The exporting of live animals, also, as explained in the preceding chapter, showed a marked increase during this period, and must be taken as one of the agencies for good and one of the causes of the revival in the industry. In the year 1870, 27,530 head of cattle, valued at less than half a million dollars, were exported. There was scarcely any increase in number, though there was a large increase in value, up to 1872, but in 1874 the number of cattle was more than doubled and the valuation nearly trebled. In 1890, 182,756 head of cattle, worth more than thirteen million dollars, were exported from this country, and during the same year forty-five million pounds of salted or cured beef, eighty-four million pounds of fresh beef products, and one hundred and ten million pounds of tallow were exported. The exportation of fresh beef products only commenced on a large scale in 1877, and during the first four or five years the total was doubled. During the seventies there was a gain of two hundred per cent in the quantity of tallow exported, and a gain of ninety per cent in the weight of salted and cured beef.

These figures, dealing as they do with the time during which the cattle trade emancipated itself from difficulties and established itself on a basis of prosperity, are not by any means sensational, although they, to a very large extent, serve as an index of progress made, and also indicate, better, perhaps, than any other figures, the building up of Texas and the Southwest, and the bringing of shipping facilities close to the homes of the people and within easy access of the principal ranches.

Prices during this period fluctuated greatly, but showed a general tendency to increase. Range cattle were down to below two dollars per hundred in the winters of the years 1871, 1873 and 1874,

seldom rising much above two dollars in those years. In 1875 prices were much steadier, and in 1877 there were very few sales made at as low as two dollars and twenty-five cents, even for grass-fed steers, while steers from eleven hundred to fifteen hundred pounds frequently realized more than five dollars. In 1878 there was a slight reaction in prices, but the loss was recovered in the following year, to be followed by a distinct rise in the value of grass cattle in 1880, with very much less fluctuation than in previous years. The great rise in prices did not come till later, but it is safe to say that the boom which materialized during the first three years of the eighties was thoroughly established, or at least the seed sown for it, before the transition period to which we are referring ended.

Early in the seventies the railroad companies, which had been looking somewhat askance at the cattle-hauling business, suddenly awoke to the fact that there was big money in it, and, as a result, active competition set in with prices not only cut in two, but sometimes cut in ten, and nine-tenths taken off. The rate war which followed enabled shippers to get their cattle East at nominal expense, loaded cars being in some cases hauled from Chicago to Buffalo, and even to New York City, at the rate of a dollar a car. It is even stated that hundreds of cars were hauled for nothing, and little presents given to shippers in addition, as an inducement to them to help make one particular line more popular and fashionable than the other. Sales were effected at satisfactory prices, and twenty dollars profit on each head of cattle driven to the Western Kansas shipping points was not considered at all out of the way or exceptional. Rejoicing followed bewailing, and heavy trainloads of fat Texas steers were hauled out of the different yards every day. It had been a very prosperous season and there was an abundance of rich grass of every description, the consequence being that the cattle were unusually fat. Thirty, forty and even fifty and sixty dollars per head was paid on several transactions, and the ordinary result followed.

This result was, of course, the driving of more cattle in 1871 than could be successfully handled. As our table on the preceding page shows, the Texas drive into Kansas jumped from thirty-five thousand in 1867 to just ten times that number in 1869 and 1870, and to the enormous total of six hundred thousand in 1871. The result was, that every vestige of grazing ground was occupied by cattle awaiting a market, and a rainy, unfortunate season set in. The difficulties of the cattlemen were increased by the settlement of the differences between the railroads. From absurdly low rates the companies went to very high ones, and whereas in 1870 everything had been as prosperous as a green bay tree for the Texas cattleman, in 1871 things looked almost as blue as ever. The cattle shrunk visibly while waiting for the market, and notwithstanding these obvious calamities, thousands of cattle kept coming from Texas and adding to the overcrowding.

Had Colonel Black's Bureau of Information and Statistics been in existence at this time, means could have been taken to have warned the cattle dealers at home that it was absurd to send more stock in while thousands of beasts were waiting for a market. But there was no way of giving this information and there was no time to give it, the result being that every one shipped what he wanted to, regardless of consequences, and the condition of affairs got worse and worse every day.

More than a quarter of a million head of cattle, thus insanely driven to a point where they were not wanted, and where there was no market for them, were put into winter quarters at the risk and expense of those who had been guilty of the blunder of driving them North. Hay was very scarce, and when the animals were sent farther west in search of buffalo grass on the prairies it was found that a succession of prairie fires had added to the complication. In the blue-grass region there was absolutely nothing left for them but burned stubble, and in the buffalo regions things were but slightly better. To add to the difficulties, a winter of unusual severity set in, with rain storms of long duration, which left sheets of ice upon the prairies. The scene almost reminded one of the Arctic regions, and when a series of intensely cold winds sprang up many men and horses were actually frozen to death.

Among the cattle the losses were counted by thousands. Following the instinct, already noted as one of their characteristics, the poor famished brutes drifted before the gale, and when, exhausted with their long, fruitless tramp in search of food and warmth, they laid down to rest, they seldom rose again. Many cattlemen found themselves absolutely ruined, and a large number of men who had been accounted exceptionally wealthy had to commence life over again and inaugurate a noble struggle for means with which to meet their heavy liabilities.

Numerous estimates have been given the writer as to the loss resulting from the attempt to overdo cattle shipping from Southern Kansas into 1871, as a result of the spasmodic and alluring boom of 1870. One gentleman, who resided in Western Kansas during the time of the calamity, states that conservative estimates placed the loss at about three million dollars, or at about ten or twelve dollars per head of the cattle which had to be wintered over, as a result of the short-sighted policy adopted by their owners. The cattle had, however, been driven North, with the expectation of averaging forty or fifty dollars per head, these figures being based upon the average rates of the preceding year. On this calculation the loss per head must have averaged nearly twenty-five dollars, and the aggregate loss must have been more than twice the figures stated. As an evidence of the terrible results brought about by lack of information, poor judgment and poorer weather, Mr. McCoy records the fact that the hides of thirty-five thousand cattle, lost in the way described, were shipped East from one station, with a total of seventy thousand from two others. One firm wintered nine hundred head of cattle on the Republican River, and could only secure one hundred and ten of them the following spring.

We have already noted that Abilene lost its cattle shipping trade at about this period; other towns came into prominence as the glory of this pioneer shipping point departed. Among them was Dodge City, from which many thousand head of cattle were shipped yearly as soon as trade began to revive after the calamity we have briefly described. Capt. Henry King, now associate editor of the St. Louis "GLOBE-DEMOCRAT," but at the period of which we are writing a prominent Kansas man, well known in political, agricultural and literary circles, contributed to "SCRIBNER'S MAGAZINE" a most interesting sketch of this town when it was, perhaps, at the zenith of its prosperity as a shipping point. The town at the time of Capt. King's visit was just budding into existence, and the buildings were of such varying and irregular proportions and patterns, and so lacking in neighborliness of size and altitude, that the idea was suggested of their having been purchased at an auction sale. Few of them boasted of any underpinning, and many of them, the article states, "sat visibly perched upon awkward corner props, as if fearing a flood." There were no fences and hence no yards, and, of course, there were neither trees nor awnings. Here and there were tents with blankets spread upon guy ropes, and opposite the hotel where Capt. King stopped a wheelless freight car did duty as a restaurant.

The railroad formed the boundary of the town proper, and thence, the article goes on to say, "spread a succession of yellow pine board pens, filled with cattle—antlered, uneasy, alien looking cattle—out over the level bottom land, pen after pen, until the boards became shadows, the beasts lost their identity, and all that was left was a queer sinister, perplexity of uplifted and tossing horns. For New Sharon* was what is known out West as a cattle town, that novel frontier village which belongs to a branch of commerce and an aspect of life unknown elsewhere under the sun. Indeed, it was not possible even here, so recently as fifteen years ago, when the vast plains of the Kansas border were the sneer of geographers, and their short, moss-like grass was supposed to be a little more than a mimicry in nature, fit only for fire and frost to sport with and make ridiculous. But the railroad came along at length and spanned the desert, and the nimble-witted Kansan, putting this and that together, evolved the idea that a pasturage upon which the plentiful buffalo had lived and flourished for ages, perhaps—certainly ever since 1542, when the Spanish explorer, Coronado, crossed it and saw it populous with the 'hump-backed oxen,' as he described them—might be profitably utilized in grazing cattle to supply Eastern markets. And so the immense herds roaming half-wild upon the Texas pampas, and there valued only for their hides and tallow, were turned in this direction; and the scorned expanse of Kansas prairie, from which the locomotive had but yesterday frightened the buffalo, soon began to furnish fat, sleek beeves to New York, Philadelphia and Boston, at the rate of hundreds of thousands a year. In round numbers, over four million head have thus been disposed of since 1870, and more than once the cattlemen of Kansas have been able to dictate prices as far away as Liverpool.

"As a direct outgrowth of this new and important business, evoked from chaos, as it were, came the cattle town—the converging point of the narrow, rambling trails to and from the outlying grazing grounds, the rendezvous of the drovers and herders, the agreed depot for the collection, assortment,

* Capt. King's article was headed "Sunday Over in New Sharon," the *nom de plume* of the city being selected, it is to be presumed, to anticipate any criticism as to the sketch being designed as an advertisement.

branding, sale and shipment of cattle; and New Sharon, at the time we saw it, was chief of its class and at the flood-tide of its activity and consequence. The town site had been located less than a year before, it is true, but already the population—'counting transients,' as the landlord phrased in—numbered as many as three thousand, while fully fifty thousand cattle were gathered there, awaiting purchasers and transportation, and all that the young city required to make her 'the metropolis of the Southwest,' the landlord assured us, was a second railroad and some artesian wells for dry weather.

"The street along which we strolled while making our observations was the main one of New Sharon—Grand Avenue, and side-walked with long, slender, creaking planks, laid in the perfunctory and uncertain style of a midnight pontoon. The symbols and inscriptions over the doors and on the windows were largely of a nature to unsettle our confidence in what the landlord had told us in praise of the water of the locality, for the drinking saloons outnumbered all other places of business three to one. We counted seventeen of them in a distance of half as many rods, bearing such signs as 'The Alamo,' 'The Snuggery,' 'Wallapus,' 'Old Fruit,' 'Dewdrop Inn,' and in front of one of them we stopped to read, over the pier-glass and the pyramidal display of tumblers behind the counter, this unique monition: 'Drinks Cash'; 'That's Mine is Played Out.' They were surprisingly quiet, though, it seemed to us, for summer afternoon purveyors of good cheer; and, in many cases the bartenders, whom we recognized at once by their characteristic little white aprons and the pink elastics on their shirt-sleeves, were lounging outside the open doors, idly fumbling their long, gaudy watch-chains, or exchanging lazy chaff with their fellows across the street. The whole town, in fact, wore an ambushed and waiting air. Occasionally a solitary herder would canter by on his jaded and unwilling pony. At times we caught the subdued hum of a sewing machine; and once a woman, the first we had seen since our arrival, drew aside a curtain and glanced out at us furtively with red and curious eyes. But these were the only interruptions of the general lethargy, if we omit the solemn lowing of the cattle, which really tendered to deepen rather than disturb the stillness.

"Not until we had left the last of the houses behind us, and Grand Avenue had trivialized itself to a cow-path, did we come upon a scene of life and animation. A kind of camp it looked to be, as of some beleaguering force just outside the crouched and apprehensive town; and it was astir, and excited, like camps when marching orders reach them. A scout had arrived, we learned, with news of an attack by Indians upon a well-known stockade, a hundred miles to the southwest. He still sat upon his panting horse, and talked rapidly, with many gestures, and round about him were a score or more cattle herders—erect, sinewy, and strong-breasted fellows—pacing back and forth, listening to his story, plying him with eager questions, muttering at times to one another, and often pausing suddenly to gaze a moment across the dreary waste of prairie, as though with an impulse to hasten at once to the rescue. It was a sight for a painter. Every face was a study. But in all of them alike beamed and flashed the peculiar intense and relentless look which you always see in the usually imperturbable faces of these sons of the border when the Indian occupies their attention. Such an expression of countenance, I think, is nowhere seen, except among men who, like these, have to grapple with the Indian problem as a personal matter. Can it be the sign of that rooted and irrepressible antagonism between the two races, which came in with the Pilgrims, and will go out, heaven only knows when?

"During the early period of cattle driving from Texas to Kansas, Indian attacks and fights were frequent, and the journey was one of military precaution and constant hazard; but in recent years, the drover told us, such events have been exceptional; the only regular annoyance from Indians now is their exaction of toll for the passage of cattle through the Territory; and outside of their reservations one is rarely seen any more, unless it may be a dead one left on the trail by some scouting party from an adjacent fort; 'But I'd rather see one dead Injun than a dozen live ones, any day,' he remarked. They have learned, by experience, to avoid the cattleman, 'knowing we're always ready for 'em,' the drover explained, and to make their raids, instead, upon the scattered and unprotected settlers along the Kansas border; and thus the trip that was once so exciting and thick with adventure has come to be an unspeakably cheerless and tiresome thing, with only a chance buffalo chase (for the buffalo, too, is now seldom met with) or a race after jack-rabbits to relieve its prolonged monotony.

"About the first of April is the time the herds are started from Red River northward, and the aim is to reach the Kansas cattle-towns, distant some eight hundred miles, in the latter part of June, the

route leading over the long, bleak 'Chisholm trail,' which goes winding and twisting this way and that, to suit the erratic bearings of the water courses, and strike conveniences for camping. Two herders to a hundred head of cattle is the rule—the herd often embraces five or six thousand head—and each herder has two horses, and is paid thirty to forty dollars per month, or twice that if he owns his horses; a boss and a cook added to these, with wagons or pack-mules to carry provisions, and an abundant supply of fire-arms, saddles, lariats, blankets, and short-handled whips, and in some cases a few dog-tents, make up the 'outfit,' as it is termed. The herd is driven leisurely until noon, when there is a short stop for dinner; then the rate of travel is gradually increased, and kept up without rest or slackening until the camping place is arrived at and a halt made for the night; there the cattle are huddled together, or 'rounded-up,' in as small a compass as possible, called 'the bed-ground,' and the herders stand guard over them, by stated turns, like pickets, until morning comes, and the fantastic expedition moves forward again, though sometimes a thunder-storm or other unexpected noise brings on a stampede, and enlivens these prosaic night watches (to the secret delight of the drowsy guards, we may guess) with a swift gallop into the grassy darkness after the terrified and fleeing cattle.

"And so, day after day, the slow, dull drive continues, each day so like every other that soon all reckoning of its place in the week is lost; each passing scene so much a mere bald repetition that the whole outlook in a short time becomes simply one vast featureless, confusing impression like the ocean. Indeed, being adrift on these great, vague and melancholy prairies is very similar to being out at sea. The drover, of whom I have spoken, told us that he never made the journey without a continual, torturing heartache and sense of exile; and it is not improbable that the most ignorant and indifferent of herders—perhaps even the worn and bewildered cattle, also—catch a hint of this feeling, could they formulate it in speech.

"Always, after a few days of the march and a fair start into what may be called the sorcery of the intervening desert, a habit of silence and reverie and depression comes upon the entire outfit, save only the unaccountable little cowbirds—the Mother Carey's chickens of this singular argosy—that flutter cheerily and constantly around the herd the whole way from Red River to New Sharon. The songs and jokes die out, the story-tellers cease to spin their coarse and knotted yarns, card-playing by the camp-fire is voted a bore, daily conversation dwindles into monosyllables. 'Every man draws himself into his shell,' as the drover expressed it; and there he remains, taciturn and brooding, unmindful of his companions and careless of himself, until some lucky morning a strange dog's bark, the crow of an early-rising rooster, or a bit of breakfast smoke from a homesteader's dug-out, rouses him from his dream, and with a thrill as of escape from long and nameless peril he comes back to the world, alert, expectant, potential.

"Once arrived in New Sharon the herder, or 'cowboy,' dominates the town. He is no longer the easy-going, mild-demeanored type of native Texan languor, and the anomalous self-repression of the trail. He 'turns loose,' as he calls it, and appears to change his disposition in the act of shifting his garments, so rapidly does he challenge every restraint of society and sound every depth of vice and shame. Perhaps the sight of civilization, after so much of the desert and its high, haunting sky, stuns and dazes his moral nature; or, possibly, it is but the assertion, under tempting conditions, of that latent and ineradicable savagery which abides, more or less, in the best of us. Be the solution what it may, the fact is glaring that he no sooner reaches the town than he is straightway seized by some occult and masterful influence which transforms him like a new creation.

"We saw it all, as in a panorama, that unforgetable Saturday night in New Sharon. The dullness which had so weighed upon us through the long, uneventful afternoon was but a lull, we soon learned, and not a stagnation. With the first approach of darkness the lethargic town rubbed its eyes, so to speak, and leaped to its feet, and in a twinkling, it seemed like an incantation, Grand Avenue was a carnival of light and motion and music. The broad board sidewalks were crowded with promenaders; smiling groups passed in and out of the drinking saloons and gambling places; in every quarter glasses clinked and dice rattled (is there another sound in the world like that of shaken dice?), violins, flutes and cornets sent eager, inviting strains of waltz and polka from a score or more establishments, and a brass band was playing patriotic airs in front of the theater, where, oddly enough, the crude morality of 'Ten Nights in a Bar Room' was about to be presented, 'with the full strength of the company in the cast.'

"Everywhere the cowboys made themselves manifest, clad now in the soiled and dingy jeans of the trail, then in a suit of many-buttoned corduroy, and again in affluence of broadcloth, silk hat, gloves, cane, and sometimes a clerical white neck-tie. And everywhere, also, stared and shone the Lone Star of Texas—for the cowboy, wherever he may wander, and however he may change, never forgets to be a Texan, and never spends his money or lends his presence to a concern that does not in some way recognize the emblem of his native State; so you will see in a town like New Sharon a general pandering to this sentiment, and lone stars abound in all sizes and hues, from the big, disfiguring white one painted on the hotel front, down to the little pink one stitched in silk on the cowboy's shilling handkerchief. Barring these numerous stars, the rich lights and the music, we missed sight of any special efforts to beguile or entrap the passer-by—perhaps because we were not looking for them; nor was there, for some hours, a sound to reveal the spirit of coiled and utter vileness which the cheerful outside so well belied. It was in the main much the kind of scene one would be apt to conjecture for an Oriental holiday. But as the night sped on the festivities deepened, and the jovial aspect of the picture began to be touched and tainted with a subtle, rebuking something, which gradually disclosed the passion, the crime, the depravity, and really vivified and swayed it all, and made it infernal. The saloons became clamorous with profanity and ribald songs and laughter. There were no longer any promenaders on the sidewalks, save once in a while a single bleared and staggering fellow, with a difficulty in his clumsy lips over some such thing as 'The Girl I Left Behind Me.' An inflamed and quivering fierceness crept into the busy music. The lights paled, flickered, and here and there went out. Doors were stealthily closed, window-shutters slammed to with angry creaks. And at length, as we looked and listened, the sharp, significant report of a pistol, with a shriek behind it, was borne toward us from a turbulent dancing-hall to certify its tale of combat and probable homicide, and to be succeeded by a close but brief halt in the noisy quadrille, presumably for the removal of the victim."

Newton made a bid for this business, and the early days of cattle shipping from that point were marked by an exceptional amount of trouble and disorder. With 1872 came the opening up of the Santa Fe Branch along the Arkansas River Valley, and Wichita, then a town of two thousand inhabitants, also received for shipment many thousand head of cattle. This was fifteen years before the great boom and the advertising to the world of the fact that Wichita was the Peerless Princess of the Prairie. The little town appeared to be exceptionally well adapted for the trade, and even before the railroad reached it arrangements were made to ship cattle from it. Those that remained out of the disastrous wintering-over experiment of the winter of 1871–72 were driven to various points, and many of them to Wichita, from which seventy thousand head of cattle were shipped very soon after the stock yards were opened. Fort Harker, sixty or seventy miles west of Abilene, also came into prominence during 1872 and 1873 as a shipping point, and there was a general revival of cattle driving to Western Kansas.

In the table published at the opening of this chapter the cattle drive of 1873 is placed at four hundred and four thousand. Mr. McCoy's estimate for the same year is four hundred and fifty thousand. The 1872 figures in the official return are three hundred and fifty thousand, with which the pioneer shipper agrees. The season of 1872, while it did not approach that of 1870, was a vast improvement on 1871. The corn crop in the Northwest was a very heavy one, and as the outside demand for corn was not great, cattle were bought in large numbers and taken North for feeding. The comparative success of the 1872 drive led to a marked increase in the number of cattle driven in 1873, when, as we have already seen, four hundred or four hundred and fifty thousand head of cattle entered Western Kansas. In addition to this there were fifty or sixty thousand head which went farther East in search of shipping points, making a possible total for 1873 of nearly half a million. About three-fifths of this number were cows, heifers and steers under four years. Three railroads were now competing for the traffic which was no longer sneered at. Indeed, Mr. McCoy tells us that during 1872 and 1873 one railroad company alone, which in preceding years had shown a disinclination to handle the cattle traffic at all, distributed large sums of money to get that traffic away from rival roads.

Had the drive of 1873 been of anything like average proportions, the year would have been a fairly prosperous one, as the bulk of the stock would have been marketed before the panic occurred. As it

was, however, the preponderance of farm or stock cattle over fat beasts came well-nigh ruining the cattle trade altogether. The scare about Texas fever naturally made buyers a little timid in regard to this class of cattle, and instead of an army of buyers appearing and competing for the choicest lots and bunches, very few buyers came at all. Dispatches were sent in various directions only to be ignored, or to bring forth replies that all wants were supplied.

Something like a feeling of horror resulted, and the disaster of 1871 was repeated, and tens of thousands of cattle were found begging for buyers at Western Kansas points. Many of the larger drivers succeeded in making contracts whereby the animals were driven to the Indian Territory. Other bunches were fattened locally, and it became necessary to borrow money in large amounts. Just as the money thus borrowed fell due the great panic of 1873 commenced in Eastern cities, and by October the business of the country was practically paralyzed.

Never had there been so many cattle awaiting buyers and shipment, and never had the demand been so absolutely nominal. The banks which had loaned money for the purpose of carrying the cattlemen were themselves pressed, and were compelled to call in the loans. Cattle were, in consequence, put upon the market without reserve, and although it is estimated that there were only about one-fourth the number of buyers that had appeared in 1872, twice the number of cattle were forced on the market during the early fall. Mr. McCoy estimates that the panic cost the Texas drovers another two million dollars, and that scores of men who had hitherto paid dollar for dollar were bankrupt. Animals by the thousands were sold for their hides, horns and hoofs and for the tallow they would produce, the flesh being thrown away as superfluous.

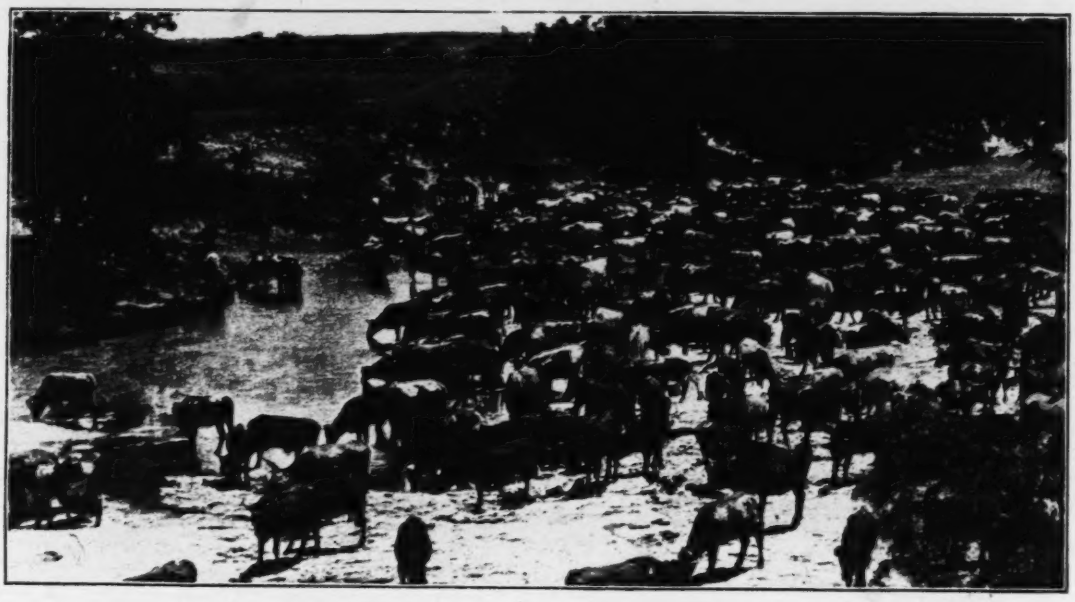
Pages could be written on the moral of this calamity, and on the lesson it taught as to the valuelessness of the most valuable products when there was no demand for them. Many men declined to sacrifice the product of their labor and capital in this apparently sinful manner, and shipped their stock East with instructions to force them for sale on their arrival. From a financial point of view, those who did this fared worse than those who disposed of their stock to the tankers. A gentleman who is now engaged as a commission man was one of those who shipped to his sorrow. The circumstances were almost painful.

"I had five thousand head of cattle at three points in Western Kansas ready for shipment," said the ex-cattle feeder. "They were fairly good stock, and ought to have yielded me a profit of at least ten dollars a head, even in medium bad times. A friend of mine in Chicago made inquiries at my request, and notified me that if I shipped on at once I should realize prices which would leave me at least a reasonable profit. I flatter myself that I did not anticipate any such a happy result, but I certainly thought, judging from my friend's figures, that I could about come out even and have a little money with which to start in again the following year. I accordingly shipped, laying out my last dollar in expenses, and borrowing a great deal more into the bargain. I never slept a wink on the way to Chicago, and when I arrived there I saw that I had not worried any too much. I was asked a dozen times in half that number of hours what on earth I had shipped for, and when at night I compared the various offers I had received I began to ask myself the same question, and to feel an intense desire to take myself into some obscure locality and kick myself a few times for being a fool. I held off a day or two with a kind of a vague hope that things would get better, or at least that they could not get worse. But on the third day the papers were full of reports of bank failures and suspensions, and the offers made me on my first arrival were all repudiated when I tried to close with those who had made them. When I finally got rid of the bunch I found I had lost money on the shipment. This sounds incredible, but it is a fact. Three of my purchasers failed before settling time, and what little money I had left was barely enough to pay what I had borrowed for shipping expenses. If ever a man was flat on his back I was that man, but my losses were small compared with some others, who lost heavy fortunes during that terrible fall."

About two hundred thousand cattle were placed in winter quarters in Kansas after the panic. There was very little hope of doing much with these animals, but there was just the possibility of a better demand the following year, and accordingly the heavy expense was incurred. Some few were driven to the Northwest, and various schemes were adopted by those who were not absolutely ruined by the panic and the glut which came side by side.

The success of the wintering experiment was not marked. As much hay as possible was secured by those who had money with which to buy it, or credit with which to obtain it. Temporary dugouts and stockades were put up, and the cattle eat hay with avidity, and did fairly well. In the extreme west of the State the cheaper method of wintering the stock on dry buffalo grass was adopted, and those who selected Eastern Kansas made more use of corn stalks and other produce. Just as the arrangements for wintering were complete the cattlemen got together with a view to discussing the situation and seeing what could be done to remedy it. Mr. McCoy reports at some length the mass meeting of live stock men at Kansas City, where a banquet, almost funereal in character, was given. The object of the gathering was to get together the cattlemen of the North and the South, and try to establish an association in their joint interest.

Eleven years later the cattlemen met in Convention in St. Louis and heralded their prosperity to the four wings of heaven; but in 1872 they met rather to condole than to congratulate. Some of the men at the banquet were almost crazed with grief and chagrin, and some amusing stories were told of



WATERING ON THE CONCHO.—From Photo by Ragsdale, San Angelo, Texas.

how the men acted. The majority, however, were there for business only, and as a result the Live Stock Men's National Association came into existence. Of this association, Mr. John T. Alexander, of Illinois, was made President, and Mr. McCoy, Vice-President. Matters grew so much worse instead of better just after its formation, that it lay in abeyance for some time, and never really assumed the proportions anticipated, although it is but fair to say that it paved the way for the larger association which followed it, and more especially the great Convention to which we have already alluded, that of November, 1884.

Mr. McCoy's remarks on this gathering and on the cattle situation, as the panic of 1873 found it, are so perfect a likeness of trade as it then existed, and so superior to anything else that has been published on the subject, that we reproduce them, merely commenting on the fact that in many respects Mr. McCoy proved himself to be a prophet as well as a close observer of human nature, and especially of the cattle trade. "It is a fact," he wrote, just after the panic, "that almost every other branch of business or occupation, although not of one-half the magnitude nor employing a fourth as many men as the live stock business, is organized completely, and by such organization aids and protects its members in a thousand ways, besides collecting statistical and other general information concerning their special business, as well as protecting their co-laborers from oppression and outrage at the hands of strong monopolies, with which they are often individually brought into business relations. It is true that live

stock men are, or have been heretofore, entirely unorganized, and as a result thereof, they are not correctly informed as to the extent or magnitude of the business in which they are engaged; nor do the stock men of one State, as a class, or as a rule, have any definite knowledge of the number engaged in like business in any other State or Territory. This might be truthfully said of most stock men, as to their adjoining counties, and often townships. Nor do they know, or have any good means of informing themselves, as to the number of live stock, hogs, cattle or sheep that are being prepared for market, or that are likely to be put upon the market at any given time in the future. And when they are prepared, or ready to market their stock, they accept the nearest and most convenient means of transportation, even if asked exorbitant rates of freight, yard charges, feed charges, commissions, and other incidental expenses to which the business is inevitably subjected.

"It would be next to impossible for railroads to effect and maintain combinations which the stockmen could not break. Corporations, by combination, would not then successfully put up and maintain the price of freight fully thirty-three per cent over rates charged previous years, and that, too, when live stock is selling at prices ranging from twenty-five to fifty per cent below those realized in former years. No such outrage could, or would, be attempted or tolerated, if live stock men would act in concert to obtain what they desire, and of a right ought to have; neither could stock yard companies insolently mistreat and abuse live stock or charge exorbitant and outrageous prices for yardage, hay, corn, or for other services rendered; they would not dare to do it. But as matters now stand, the live stock men, entirely unorganized, each one by himself and for himself only, are subjected to the arbitrary restrictions and extortionate charges of conscienceless corporations. A stockman or shipper sees himself wronged, and his stock abused, neglected and otherwise mistreated, but feels himself powerless as to remedies, and usually does nothing but mutter curses, not loud, but deep; then pass along, only to have the same outrages repeated as often as he attempts to go to market.

"The only remedy suggested to me for these and many other abuses and grievances is in organization. Then a potent protest, that could and would be enforced and respected, would issue against offending parties, and they be compelled to do right and act fairly with their patrons; or, in the event of their persisting in oppressive practices, such retributive justice could be meted out to them as would compel a change in their conduct and manner of doing business; or the business would be entirely taken from them. Again, if the stockmen were properly associated together, a statistical bureau would be established for gathering and disseminating such information as would enable the members of the association to form correct estimates as to the amount of stock in every section of the country, and the probable number that would be marketed each month of the year.

"It is not difficult for the practical cattleman to see wherein such information would be of inestimable value in forming business calculations and correct judgment of the probable future status of the business and markets. Besides, a great aid to both buyers and sellers would be thus created, and a general business register of the wants or desires of live stock men would exist, to which any member might refer at his pleasure, and thus save much time and money, which would otherwise be spent in rambling over the country seeking, without knowing just where to look, for that which he desired. The advantages of organization or association are so numerous and so great, that it is time spent idly to urge them upon the attention of thinking, discerning live stock men. But, if they continue to bear without effort to remedy the many evils, abuses and extortions which have been heaped upon them in the past, then are they degenerate dung-hills, and unfit to bear the proud distinction to which, as a class, they aspire.

"But we hope and apprehend the day is not distant when there will be found organizations of live-stock men in every State and in many counties, all of which may be made auxiliary to a general or national association. When that day does come, live stock men will be subjected to fewer losses and be able to conduct their business in an intelligent, systematic manner, just as in every other industry or vocation in the United States. It is in no sense for the lack of intelligence among stockmen that effectual organization has not before been effected, but from a habit of doing and acting in an independent individual capacity. The benefits to accrue from association are not thought of nor realized; but the day now is when their numbers and their interest alike behoove them to organize for their own mutual benefit, information and strength."

In the next chapter we shall have occasion to deal more with the question of association between different interests among cattlemen, and the hopes and possibilities connected with fusion and amalgation. Before doing so we have to consider and trace as nearly as we can the circumstance connected with this exceptionally dark period of the history of the cattle trade, and the way in which light gradually dawned on the horizon as a harbinger of the good times which finally came. The history of the cattle trade of the South and Southwest, and of the United States generally, is one of cycles, and it is of the worst side of one of these that we are now treating.

All things seemed to conspire together for the injuring of cattlemen and cattle at this period. There was not the abandoning of herds in the way that prevailed during the war, but, in some instances, there were catastrophies bordering very closely upon it. One of the calamities of this kind has much of the wierd and unnatural about it, and arising out of it there still continues a condition of affairs which seems almost incredible. This is the existence of a herd of cattle on a ranch which is practically a prison, and from which there is no available means of escape or exit. The cattle number one thousand or more, and are said to be fat and sleek; but they are in a position more anomalous than that of fish out of water.

The scene of this wonder is in Utah. The ranch is oblong in shape, and along the two main sides there arise precipitous cliffs, to climb which is impossible. At each end rushes the Yampa River in its circuitous and temptuous course, and thus on all four sides the cattle are hemmed in, their prison being a fortress of the most amazing type. The story of how these cattle got in this natural jail is even more interesting than a description of the prison itself. At the time when the cattle trade was in the very depths of its adversity, or about twenty years ago, the Danites, or Avenging Angels of the Mormons, were being driven into the wilderness by the Government troops. A few of those who had been the blindest followers of Lee, the Mormon fiend incarnate, whose hands were red with the blood of women and children, found in their wanderings a pretty valley or stream, which flows from the Wasatch Range into the Green River.

They stuck their stakes, built their camp-fires, and during the night their sagacious leader had a vision which told him there to stay. They could hardly have chosen in all Utah a more fertile or more isolated spot. They called it Ashley, and about them have since gathered more of their sect, until where the refugees posted their pickets on the lonely nights of the first summer has grown a thriving village. It is one hundred and forty miles from the Union Pacific Railroad south, and a hundred and forty-five miles north of the Rio Grande Western. Until within a few years past it has been isolated entirely, but now it is but thirty miles from the Ute Reservation, and furnishing supplies for the agency forms quite a business for the community.

It was a tenet of the Danites that robbing or theft from a Gentile was no crime. So it was thought to be only a cunning trick when John Wyckliffe, one of the Mormon settlers of the new town, and his three sons made a night sortie on Henry's Ford, in Wyoming, and carried away eight hundred head of cattle ranging there. This was in 1874. The owners of the cattle discovered their loss a few days after they were gone and started in pursuit. The Wyckliffes had their friends along the trail, and were warned by signals of the coming of the pursuing party. Accordingly, they drove the cattle as fast as they could travel on eastward, across the Green River and up along the Bear, with the intention of reaching the Elk Mountain country, in Northwestern Colorado, where they would be practically safe from detection, and their stock also could secure the most succulent food.

The thieves and the stolen herd had reached the mess of inviting grass at sundown one day, and halted to camp for the night. A terrific storm arose. The lightning flashed incessantly, and the thunder pealed and cracked with unintermitting fury. The four men desperately held the terror-stricken cattle by riding around them constantly and chanting some weird tune. But the wild fearfulness of the furious storm excited the brutes beyond measure. They surged and ginned, every moment growing less subject to control. All at once, as if by one mad impulse, they stampeded.

A stampede of cattle by day is calculated to strike terror to any heart, lest there should be some human being in the pathway. A stampede by night, and during a furious thunder storm, with the lightning revealing the huge mass of frenzied brutes hurling itself on like a living catapult, frantic with fear, and as resistless as the storm itself, is one of the grandest and most appalling spectacles. All

the mad might of frenzied animate force is aroused; and self-destroying, as well as destroying all in their way, they rush on until they fall dead-like or plunge into some abyss.

John Wyckliffe and his sons met their fate amid the lightning's glare and the thunder's roar. They endeavored to head off the stampeded herd. Instead, they and their horses were swept on, and driven, in the terror to escape the charge of the maddened animals, over the brink of the awful precipice which frowns up from the waters of the Bear. After them plunged the whole fright-crazed herd, and down to the bottom of the fearful fall went horses, riders and horned creatures.

Out of this plunge of life, to what was seemingly certain death for all, a few of the herd were not killed. Those which had gone ahead had formed a cushion of death. Maimed, stunned, but still invested with a spark of life, when the dread storm was over, the living cattle crawled out from the mass beneath them and formed a nucleus for the herd which now roam at will within their rocky confines. On the bank of the river, stretching back a few hundred yards, grow succulent grasses, and upon this the cattle have propagated and thrived. In looking over the edge of the precipice, one can see that they are small and as wild and as agile as a deer. They have been shot at to see the effect, and have learned to regard the appearance of a man, whether Indian or white, as a menace from which they flee, clamoring over rocks and through underbrush in the chase to a point of concealment.

The place where the thieves and their horses and the herd fell is plainly marked by a pyramid of bones which rise to the height of thirty feet. The ghastly reminder and relics of the human and animal victims of the terrible leap shine forth white and glistening when the sun is high and reaches that spot with its full glare. The progeny of the surviving animals from the fall are fat and sleek, though, and have their sunny beds, deer-like, where they lie for warmth in the winter, and to them the monument of skeletons is no source of disquietude. There is no fierce mountain lion or more dangerous bear, nor, in fact, any other animate thing within this cow-garden of Eden. As yet, too, no man has been able to reach or disturb them.

This story, so romantic in character as to almost challenge its accuracy, is merely given as an illustration of the difficulty of the times. Troubles, Shakspeare aptly tells us, come not in singles, but in battalia, and it seems as though this were the case even more than usual in the cattle industry twenty years ago. Had not the men connected with it been blessed with back-bone of abnormal character, the condition of affairs would have been very serious, and the country would have been taught a lesson which, perhaps, would have done it good, although it would have also subjected it to inconvenience and even famine. The work done by the cattlemen in supplying the needs of a race of beef-eating people has never been appreciated at its full worth, and had the men, whose prospects were blighted by the panic of 1873 and the absolute dearth of business in 1874, given up in despair and turned their attention to some other mode of livelihood, there would have been a shortage in the cattle supply, the extent of which few people have stopped to inquire.

This calamity was averted by the stern, business-like activity of the cattlemen. It is not quite true that a man who was once a cowboy never leaves the prairie for town life. On the contrary, some of our best-known bankers and commission men graduated from the open prairie and from the wild, unfenced ranch. At the same time, there is something about blue grass and open country which cements the affection and regard of those who have earned a living upon it, and hence it was that the boys stuck to their lasts, to use a common trade expression, when there was every reason to fear a stampede in some other direction. The opening up of immense tracts of country for stock purposes in the extreme West, and particularly in Wyoming, Northeastern Colorado and Northwestern Kansas, acted as a safety-valve in time of danger, and the development of the stock-raising industry in these sections proved of incalculable value.

The belt of country along the line of the Rockies, over a thousand miles long and four hundred miles wide, is so admirably adapted for cattle-raising purposes, that, as the panic subsided, attention began to be turned to it in proper ratio, and this as much as anything else helped to bring about a speedy turn in the cycle and a period of prosperity. Many a man gathered together what little he had left out of the wreck and fed cattle in this wild region, where he succeeded in making a new start in life. In 1873 one herd of eleven thousand cattle was driven west from Texas in the manner described, and there were many other instances of even a larger character. In Colorado the stock-growers

organized at an early date, and their association proved to be of immense value. Many thousands of cattle were recovered after they had been stolen, and in some instances the consent of the Governor of New Mexico had to be obtained in order to enable the hunters after stolen cattle to cross the border line and recover it for the benefit of the actual owners.

In Northwest and Western Kansas the industry also obtained an impetus after the calamities recorded. Mr. McCoy records, with much interest, the location of the Victoria colony by English and Scotch capitalists. The colony was located along the line of the Kansas Pacific Railway, and was well watered and exceedingly well adapted for its purpose. Thoroughbred cattle were imported in large numbers, and it was found that beasts could be cared for an entire year at a cost of about two dollars per head. A large number of Galloway stock was placed on the ranch, and here, as elsewhere, the results of the importation of better blood proved exceedingly successful.

New Mexico also found grazing ground for thousands of head of cattle for which no market could be found in consequence of the panic. This vast Territory offered every facility for cattle raising, with the single exception of the fact that there were too many sheep, and always have been, to please the average cattleman. But New Mexico and Southern Colorado received many thousand head of cattle at the time we are speaking of, and although there were many difficulties to be overcome, there were, also, great successes, many men making quite a considerable fortune out of the work. Nevada grazing grounds were also used in the same way, and thousands of Southern cattle were driven on to them. Still larger numbers went to Wyoming, and others found temporary resting places in the Indian Territory. Various estimates of the number which were placed in different parts of the Indian Nation during the fall and winter of 1873 have been given. The total was certainly away up in the hundreds of thousands, and as a safety-valve it proved of inestimable worth until the Government put a stop to the grazing of cattle in Oklahoma and the Cherokee Strip, in response to a demand for increased land for the homeseeker and "boomer."

These facts, combined with other influences we shall try to trace, helped the industry back into prosperity. The growth in the foreign export trade was an important factor, and about the year 1876 its influence began to be felt to a very remarkable extent. Enterprising Eastern capitalists, discovering the fact that there was money to be made out of this business, commenced slaughtering cattle in the Western markets and shipping the carcasses to Europe. Improved shipping and carriage facilities aided this movement, and, after a very few months, its influence began to be apparent. Live cattle were at first shipped, but the importing countries were hampered by agitations in behalf of home agriculture, and before long dressed beef took the place of live animals. The canned-beef industry also led to a heavy demand, and prices, which had been very low, commenced to spring up rapidly. The early eighties saw them abnormally high, and the excessive prices of 1881 and 1882 will not soon be forgotten. Those who had stuck to the trade in spite of discouragements had their reward and made fortunes far greater than those they had lost.

Four years before high-water marks and records were made in prices there was a perfect revolution in the trade. It began to be breathed abroad that there was money in cattle. Hundreds of thousands, and indeed millions, of dollars were withdrawn from other investments and diverted to Texas and the Southwest. The demand for breeding cattle was tremendous, and every one who could get a ranch did so immediately. The activity was most marked in Texas, the Indian Territory, Wyoming, Arizona, New Mexico and Colorado, and these States and Territories vied with each other in enterprise and activity. Early in the eighties there was a distinct scarcity of young stock, and especially of heifers. The short corn crop of 1881 was one of the many things which conspired for the good of the cattle industry, and the open winter which followed was equally advantageous. The Western States and Territories were able to winter their cattle in good condition and at trifling expense, while in the Eastern and older States the conditions were far less favorable.

For two or three years there has been a heavy drain on native cattle, high prices having tempted the marketing of immature stock. The spring of 1882 found an absolute shortage in the market, and this time the panic hit the other fellows and helped the cattlemen. Those who had raised fat cattle on buffalo grass found themselves in clover. Nine cents a pound gross was freely paid in the great markets, and cattle were shipped in with great rapidity and much eagerness. Everything was rosy and

delightful, and many a handsome fortune was made by men who, less than ten years before, had been almost in the depths of despair, with ruin staring them blankly in the face.

It is usual to condemn corporations on general principles, and to speak of trusts very much in the same tone as of small-pox or diphtheria. In the cattle trade this has been the case quite as much as outside of it, and the Big Four has come in for a great deal of vigorous condemnation. That it has combined to keep down prices during recent years, and done a great deal to injure and hamper the cattle raiser, can scarcely be denied; but it is fair to remember that this combination helped materially, in its component parts, at any rate, to bring about the condition of affairs which we have described. The millions of money introduced into the business made it possible to provide the ice houses, refrigerator cars and other requisites for carrying on the business of shipping dead meat; and the success of the Big Four, while it has meant the ruin of many others, has to a considerable extent helped a good many more.

To another class of corporations immense credit must be given in the matter of the great revival of the cattle industry during the eight or nine years which followed the panic. Some people say that the railroads encouraged the fencing in of ranges, and others assert that the fencing in of ranges encouraged the building of railroads. This is a point concerning which we are not compelled to express an opinion or advance an argument. But it is a fact, nevertheless, that under existing conditions, and especially in these days of fences, cattle raising would be well nigh impossible without the admirable railroad facilities now provided.

During the time when every cattleman was living up to the proverb which tells us to make hay while the sun shines, the railroads did their share of the work in excellent shape. Of course, there was frequently a shortage of cars during the tremendous rush to ship in the cattle during the short period of inflation, but this was scarcely to be wondered at. All the best-managed roads gave exceptional privileges to cattle trains, and frequently points were strained in their favor during the year 1882, when every man who had anything in the shape of a calf, heifer, steer or cow was tempted to convert it into money. Some men freely asserted that high prices had come to stay, and others went so far as to argue that nine cents a pound was a comparatively small figure compared with the high prices that were to be established upon a permanent basis. A good many long-headed cattlemen, however, were inclined from the first to be a little suspicious of the boom, and to foresee in the excitement which prevailed the beginning of the end, and the commencement of another cycle in the trade. These men, wise in their day and generation, realized on their investments, and allowed enthusiastic would-be buyers full leeway, though many others preferred to hold on and are still in the front rank of cattle raisers.

Mr. Wm. Kuykendall, in another of his admirable letters to the "TEXAS STOCKMAN AND FARMER," says of the period of which we have just been writing: "We find ourselves at the threshold of a new era in the cattle business, not only of Texas, but of the entire Western section of the United States as well. For the first time in the history of the industry we find the demand exceeding the supply, which, in keeping with that inexorable law of commerce, rapidly forced prices beyond normal conditions. Values of all classes of cattle were enhanced two or threefold, and grazing lands in sympathy advanced in prices proportionately. Ordinary stock cattle readily commanded from eighteen dollars to twenty dollars per head. Every female animal, whether good, bad, or indifferent, was reserved for breeding purposes. She cattle were no longer sent to the shambles, and the custom which, prior to this date, obtained among the ranchmen of slaughtering for domestic purposes nothing but choice heifer calves, was discontinued to a great extent, as it was deemed too great a violation of the law of economy. Quality, that important factor which determines the valuation of every herd, was entirely lost sight of, numbers being the great desideratum.

"To supply the demand for breeding cattle to stock new ranges, drafts were made upon the herds of Louisiana, Arkansas, and other Southern States. The Pan Handle, hitherto almost a terra incognita, and regarded as unavailable to settlement, soon became tributary to the demand for new ranges, and countless herds of longhorns were located upon these treeless plains, the erstwhile grazing grounds of the buffalo and the undisputed home of the red man. Kansas, Colorado, Wyoming and Nebraska felt the impulse, as well as Arizona and New Mexico, and in turn yielded their virgin plains to the production of cattle. Indeed, the entire grazing section of the country was brought under subjection."

While the cattle industry was emerging from darkness into light—from the depths of disaster to the heights of prosperity—great interest was manifested by foreign countries in its progress. Nearly all of the leading English papers published letters and articles from the plains and prairies, and many of the communications were full of interest, with more or less of fact. One of them we reproduce in part. It took the shape of a diary-form letter from a young Englishman, who, it is explained, "hired with a cattle king, Goodnight by name, to go to Texas to drive a herd," this engagement resulting in a partnership with a young Scotchman, and in the two young men striking out for an unoccupied ranch on a canyon on the borders of Texas. Writing on January 1, 1877, the young man said: "Goodnight left here on November 4, and by the next night we had all the things down the mountain. We were able to make a 'kinder' road for the first third and the last third of the hill, but the middle was too steep, and we had to unload the wagons and carry the things down on our backs. We then let the wagons down, hind end first, with a rope attached to the pole and turned once around a tree, and a man at each wheel. We got everything down safely and broke nothing, which was lucky. Almost the first thing done in the canyon was the slaying of two wild turkeys, which were very good eating. We drove the cattle down to where we are now, about twelve miles from where we struck the canyon.

"Everything went on much as usual—with the exception of two snow storms, one on November 13 and the other on November 22, as we had no house, and doing everything; especially getting out of bed, in a snow storm is 'bracing' to say the least of it—until December 11, when riding along down the river alone on 'Cubby,' I espied a bear. I immediately threw the persuaders into 'Cubby' and ran him up to the bear, who, of course, at the first sight of me made off as fast as possible. I kept circling round, keeping him in the open till I had killed him. I had no gun with me, only my six-shooter. I shot fourteen times before I got him to stop, but, I think, I only hit him three times. Shooting 'on the dead run' (the way they say 'at full gallop' out here) is very good fun and exciting, but with me, as yet, it is very chance work, as about all a fellow can do is to throw the pistol down toward the object and pull trigger. I have heard of good shots on horseback with a pistol, but haven't struck any yet. I skinned my bear and brought the hide into camp, when I rather surprised the 'boys,' as though we knew there were bears down here, having seen their tracks, we did not expect to see them without hunting them. Ley Dyer (one of the boys) has shot a bear since, and we have been living on him for some time. The meat is the most delicious you can imagine. I never saw any meat as fat as the bears we have killed. Their skins are so glossy, and when running they seem to tremble all over. The only kind of bear we have seen yet is the black bear. On the 5th I struck 'an outfit' hunting a cattle range. They were rather vague about where they were, and from what they told me they were thirty miles out of their reckoning, and they did not even know the name of our river, although they knew that it was somewhere in the country. The next day I struck two fellows hunting cows, or, rather, traveling over the country on the spec. of finding cattle which a large company lost on the drive from Texas to Kansas.

"The 'Texas drive' this year was about two hundred and seventy thousand head of cattle. The company they are working for lost about two thousand, and drove about seventy-five thousand. One of the fellows is a Scotchman, and reminded me very much of John ——; they are here yet, and will be, as long as they like. Anybody striking an out-of-the-way place like this stays there as long as he feels so disposed. On the 15th we finished the first room of our house, and so felt easy about future storms. On the 16th we went down the river to kill some turkeys for Christmas; about fourteen miles down a little stream we got fourteen. I killed my first (I have just come out of doors from helping to 'get away' with the last of them). The reason I have been seeing everybody is that I am the only one riding every day, as the cattle are very little trouble now, and seem contented (I don't know if it is because they can hardly get out), and the rest of the boys have been working on the house and corrals.

"On the 22d I washed all my clothes, a very great undertaking, as I had a large collection—in fact, every stitch I possessed—not having washed my clothes since we left the Canadian. On the 23d and 24th it snowed. We all shaved and 'greased up' with bear oil for Christmas—the only thing we could think of doing, as we had run out of all grub except flour; but then flour, bear, buffalo and turkey is pretty good living. On the 25th, Christmas Day, Ley started up-country to find what had become of our provisions, and corn for the horses, as they were overdue nearly a month. It snowed

again on the 28th, and the snow is on the ground yet. We all think it must have been a pretty severe storm in the outer world (i. e., out of the Palo Duro Canyon), as we are pretty far south. Yesterday we repeated the shaving and greasing-up for the new year. It is very curious how it changes fellows shaving off their beards. Ley Dyer has a very slight growth on the upper lip, and shaving it off made him look very long-faced and large-toothed, Dane (another boy) is also ambitious as to his upper lip, and so shaved it and his side-whiskers, and underneath his chin, till he looks rather like a navvy, and a pugilistic one 'at that.' They say that Johnson and I look like 'winged outfits' about the head, as nobody wears side-whiskers out West.

"All these items I gather from my almanac, which I have kept ever since I struck the United States, and am sorry the new one has not come in to begin on at once. I now, having got rid, as it were, of the old year, will wish you all, or rather will hope you have had, a merry Christmas and a happy New Year. I did hope to get off a letter in time for Christmas. These fellows, the lost cattle hunters, who in their travels of six weeks struck Fort Elliot, with the exception of which they never saw a white man till they came here, say it is one hundred miles any way you make it. You may think it strange that we do not start out and go there, but any journey down here means two fellows away for an indefinite time, and our horses are too poor (through delay of corn) for us to hunt anything but cattle, although, of course, we would like to go to the fort for letters. They have a weekly mail there which comes from Fort Dodge on the railway. They call it two hundred miles from Elliot to Dodge.

"I do really hope you are beginning to understand the amount of uninhabited country in these parts—it has become a pet hobby of mine thinking about it. The buffalo are pretty thick here. The main herd is about one hundred and fifty miles southeast of us. The Scotchman saw it two years ago, and says it was about one hundred miles long and fifty broad, and I have always heard they are pretty close packed in the main herd. I don't think I told you about the first buffalo I killed. I was, luckily, on 'Cubby,' who, as you know, is my favorite, and exclusively my own horse ('doesn't belong to the concern,' as Goodnight would say). I ran 'Cubby' right up alongside the buffalo, within about ten feet, and commenced firing with my six-shooter. I brought him down at the sixteenth shot, having, of course, to load and throw out the shells 'on the dead run'; very exciting and jolly, and not at all dangerous, as long as you don't tumble off your horse at any sharp turn after the buffalo is wounded."

Writing a week later, the same correspondent said: "On the morning after I had written the above, Walter got into camp with letters and tobacco, so you can fancy what a jolly evening we had. You should have seen the boys going for the baccy—they got it off his saddle before he had time to get down. I got your letters from Offley, also C.'s, L.'s, and P.'s. Please thank them all. I can so easily imagine you all at Offley, and everything going on 'as per usual.' Thinking of how people at home, especially in country places, seem to have certain things to talk about and do at certain times, is a great source of amusement to me. I was very much struck with it on my run home last year, especially Mr. Davies's church, where the fellows seemed to all have on the same coats, etc. Four days ago Ley and I started down the river on an exploring expedition, and he took it into his head to rope ('lasso,' as the yellow-backs have it) a buffalo. He threw his rope onto a buffalo cow, and shot her twice. The cow then commenced 'coming for' him, and his horse getting scared, 'let into bucking,' and spilt Ley on a stump. He got very badly shaken, and can do nothing yet, but I hope there is nothing else wrong. For two or three hours he lay and could not move at all; and I had to move him when he had to change positions. The first thing he said was, and is, I believe, what everybody has in their minds when badly hurt, 'I tell you, Hugh' (my name in this latitude), 'this thing of life is a mighty uncertain kinder business.'

"Things have never looked so well for us before, as now we have got the cattle into a place where they can hardly get out, and the only thing we have to fear are horse and cattle thieves. Our expenses are comparatively over. Of course, we have been under very heavy expenses till now, as it takes so many men to move cattle about the country, and you are more liable to lose them; and they never do as well and 'breed up' till they are settled and, as it were, at home. I shall not enter on this any more till next fall, when we shall sell our beef, and I hope to send you a very favorable report in figures. In this life there is a very happy combination of business and pleasure, as a fellow is always running across game which other men have to hunt, and then very often don't get."

In view of the many conflicting statements as to the business in 1883, we have prepared the following table from returns furnished by the different railroads. The figures show the number of cattle received at Chicago, St. Louis and Kansas City during the year, and have never before been published in this form.

CATTLE DELIVERED BY	CHICAGO.	ST. LOUIS.	KANSAS CITY.
Chicago & Alton	214,769	20,629	6,177
Baltimore & Ohio	1,732	....	....
Chicago & Atlantic	1,847	....	....
Chicago, Burlington & Quincy	556,836	2,305	....
Chicago & Eastern Illinois	25,909	....	....
Chicago & Grand Trunk	2,100	....	....
Chicago, Milwaukee & St. Paul	261,698	....	....
Chicago & Northwestern	258,249	....	....
Chicago, Rock Island & Pacific	271,987	....	13,433
Chicago, St. Louis & Pacific	3,855	....	....
Illinois Central	98,799	....	....
Lake Shore & Michigan Southern	4,943	....	....
Louisville, New Albany & Chicago	11,073	....	....
Michigan Central	4,219	....	....
New York Central & St. Louis	1,467	....	....
Peoria, Fort Worth & Chicago	3,296	....	....
Wabash	181,005	101,289	9,967
Missouri Pacific	....	160,391	43,785
Frisco	....	57,783	....
Cairo Short Line	....	4,397	....
Louisville & Nashville	....	4,308	....
St. Louis & Cairo	....	396	....
Ohio & Mississippi	....	2,918	....
Indianapolis & St. Louis	....	2,952	....
Vandalia	....	4,500	....
Toledo, Cincinnati & St. Louis	....	82	....
Keokuk & St. Louis	....	2,626	....
Hannibal & St. Joe	....	....	6,576
Union Pacific	....	....	45,601
Southern Kansas	....	....	94,339
Fort Scott	....	....	29,605
Council Bluffs	....	....	14,889
Sante Fe	....	....	177,651
By River	....	13,648	....
Driven in	5,183	6,689	18,757
Total	1,909,167	410,008	460,780

This return shows that the receipts of cattle at the three largest markets, during a year which has frequently been spoken of as one of phenomenal, and indeed wonderful prosperity, of something less than three millions. Various estimates received orally from men engaged in the trade have placed the total for the year as high as five and even seven millions, showing how dangerous it is to base calculations upon problematical and mental arithmetic calculations. Chicago continued after this point to gain rapidly on its rivals, and during the first six months of 1885 it received 886,619 head of cattle, as against 812,593 during the corresponding period of the preceding year. Kansas City about held its own with a total for the six months of two hundred thousand, while St. Louis fell off considerably, its total for the first six months of 1885 being one hundred and eighty-six thousand, as against two hundred and forty-three thousand in the corresponding period of 1884.

The figures are given at this stage because the period covered was very largely pivotal in character, including as it did the last of the boom years and the opening period of the very disastrous reaction which almost of necessity set in.

CHAPTER VII.

Cattlemen in Convention Eleven Years Ago.

THE history of conventions contains the record of no grander gathering of delegates than that at the first National Convention of Cattlemen held in St. Louis during the third week of November, 1884. It is generally stated that this was the largest Convention ever held in point of numbers, excluding only the great nominating conventions held every four years. Every newspaper man will bear out the statement that the difference between the anticipated and the actual attendance at commercial or industrial conventions is almost always extraordinary. The writer while connected with the daily press reported several hundred gatherings of this character, and was often called upon to disprove, by actual facts and registrations, the optimistic figures given out by the heralders of the conventions. Frequently, when it was announced that seven or eight hundred delegates would attend, a couple of hundred was all that put in appearance, and it was quite usual to allow the public to encroach considerably on the space allotted to delegates, in order to cover up the nakedness of the affair somewhat.

But the Convention in November, 1884, was an exception to this rule. We are not aware exactly how many delegates were announced in advance, but the names are recorded of thirteen hundred and sixty-five men who were admitted to the floor as accredited representatives of cattle States or cattle associations. In addition to this there were at least a thousand others in attendance, who were deeply interested in the result, and who formed a lobby of an intelligent and influential character. St. Louis has been called the City of Conventions on account of the immense number of representative gatherings, political, social and commercial, which have been held within its hospitable gates. Never, however, has it been called upon to welcome a convention of more colossal proportions than the one to which we are now referring, and which marks so great an epoch in the history of the cattle industry of Texas and the Southwest, that we are compelled to deal with it at considerable length. There had been money in cattle raising for some years, and prices had touched such high points that many of the men who answered to the roll-call on the occasion named had merged from practical insolvency after the panic of 1873 to wealth and opulence after the boom which culminated nine or ten years later.

The cattleman, as all the world knows, is generous to a fault, and the way money was spent in St. Louis during the week of the Convention made glad the hearts of her trading citizens. Many exaggerated stories have been told concerning the feasts and fetes of the week; but, setting these aside, it is a fa[illegible] that presents, souvenirs and keepsakes were bought in every direction, and thousands of dollars were certainly expended in this way. Pride, we are told, goeth before a fall, and one of the most reliable and conservative cattlemen in the country merely voiced the sentiment of several of his colleagues when he told the writer, last fall, that he believed the tremendous show of wealth and success of the great Cattle Convention of 1884 sounded the death-knell of the industry, and hastened, if it did not cause, the heart-breaking reaction which followed.

This opinion is merely reported and not endorsed. The ancient Romans had a proverb which, being translated, reads "Great is the truth and it must prevail." Argued from this standpoint, the obvious genuineness of the first National Cattlemen's Convention and the immense fund of information which it laid before the trade, and incidentally the public, ought not to have had any such effect as that suggested. In a subsequent chapter, while tracing the causes of what may be described as the fall from grace of cattle raising as a money-making or money-coining industry, it will be necessary to revert to this subject and to this opinion, which is merely quoted here as an evidence of the magnitude of the Convention in the eyes of those best able to form an estimate and base an opinion.

Certain it is that there was very little modesty or bashfulness about the Convention or those who attended it. The Cowboy Band, of Dodge City and Parsons, Kan., was something unique in the

extreme, and every one in St. Louis gazed with mingled awe and astonishment on this aggregation of musical wealth, or wealthy music, whichever may be the correct expression. This band has been correctly described as the most unique feature of this very unique Convention. It did excellent service as an escort to the various delegations which marched to the Exposition Hall, making several trips back and forth and leading the procession which escorted the Governor to the hall. It was composed of nineteen performers, all of them cowboys selected from the various cattle companies in Kansas. The leader was J. W. Eastman, and it was made up of the following members: D. Mathies, James Smith, Roy Drake, W. K. Robertson, W. S. Reamer, George Horder, H. G. Willis, Harry Adams, Frank Cummins, L. A. Louher, Frank Warren, George Meserale, C. M. Beesen, George Ragland, Charles Ottero, C. A. Miller and W. M. Visquesney.

The band uniform was a very appropriate one, consisting of a white felt hat, with a band, having the name of the musical aggregation inscribed on the side, and with the figure of a steer and the brand of the company to which the performer belonged in front; blue shirt, leather leggings, boots and spurs, and belts with ivory-handled pistols in them, completed the outfit. Capt. J. S. Welch was the drum major, and, instead of the usual staff, he carried a magnificent pair of horns, with a banner suspended from it inscribed with the legend: "Cowboy Band, Dodge City, Kansas, $20,000,000." The figures indicated the amount of hard cash represented in the band. The horns were among the finest ever seen. They measured five feet from tip to tip, and were highly polished and richly mounted. The band was offered one hundred dollars for them by a commission merchant. It took part in all of the public demonstrations. The members were all skilled musicians, but had only been practicing together for a week.

The large hall in the Exposition Building was decorated with a profusion seldom seen since. The popularity of the cowboy among members of the fair sex was evidenced by the presence of a large number of the fairest daughters of St. Louis and vicinity, and all around there were flowers and plants. Two handsome horn vases filled with flowers stood upon the Chairman's table, and elegant banners bearing the names of the different States and Territories were scattered throughout the hall. Every one in the city realized that something exceptional was taking place, and as a very excellent report of the Convention published at that time says, "the great broad-shouldered, brawny, bearded men, although they looked not quite at home, showed a proud consciousness of being welcome. These were the cattlemen of the West, coming together in St. Louis to their first annual Convention. There was an unmistakable class look about them—a class look, too, of which every man in the class may be proud. There was the unfettered carriage of men whose lives had been lived on the great plains, who were accustomed to wide horizons, who were used to the open, wholesome air, to much horseback riding, to much camping out. Even in matters of dress and bearing, the cattlemen are peculiar; they wear wide white hats, long black coats, and, as a rule, long silky beards. The toilet sets off the form well, and no man could help being impressed with it."

"The men," the report referred to went on to record, "represent many millions of capital, and the most tremendous new industry of America. They are the men who have put a new value upon the waste lands of the boundless West. Their herds, recalling the pastoral days of the world's history, fatten upon a thousand hills, from the farthest reaches of the Republic in the North to the Rio Grande. They are the latter-day representatives of the patriarchs, and they have some of the patriarchial in their bearing and manner. The business which has brought them together has been so thoroughly well advertised that there remains but little to be said about it. They come together to consult on the national needs of an industry that represents more capital than would be required to pay off the national debt. There is legislation needed by Congress and by separate States, which the Convention requested. There were trade matters of national importance which the Convention discussed. There were a hundred things done vital to the cattle trade, and through the latter trade to the Western country, which gave the Convention a paramount importance.

"The Texas men concluded that there was only one matter that they would press upon the Convention, and that was the National Trail. The matter was debated over and over again, and it was decided that that issue alone should be pressed, and that Texas would ask nothing else. At the same time, Texas did not believe that there was ground for being over-confident of the ultimate establishment

BUFFALO AND ELK ON CHARLES GOODNIGHT'S RANCH.

THE

LIBRARY

of the trail. The opposition of Kansas was counted upon as sure, and it was admitted that it will take one million dollars to buy the right of way over the settled part of the proposed route. The Texas delegates had been told that while the delegates from the North would not oppose the trail scheme, they would not work for it, and they would sooner see it fail than succeed. If the North was not sure that Kansas alone would itself fight the trail, its delegation would be actively hostile instead of passively and inertly careless.

"The Wyoming delegation, at its caucus, concluded to present a resolution, which it asked to have included in the memorial, asking for legislation which will permit the leasing of the public domain to the stockmen. Mr. Nagel, the Chairman of the Wyoming delegation, explained the desire of himself and his friends thus: 'These lands are entirely unfit for cultivation; they are only good for grazing. Now, we want Congress to pass such a law as will permit the leasing of the public lands. We hope to have the matter so arranged that the Government will lease large blocks of land by district to associations of cattlemen, who will divide it out among themselves, thus preventing any man from fencing off the water. You see, they are not doing anything which would be opposed to the rights of other cattle owners. Of course, all these matters of detail are very simple, and are to be considered afterward. The main point is the leasing of the land for the longest term possible. That we will press upon the Convention as strongly as we can. It is very easy to arrange and protect the rights of all under the law.'

"In all the delegations the questions of quarantine were discussed, and part of the memorial will be devoted to this subject. The Convention asked Congress to pass rigid quarantine laws, which will effectually protect the cattle industry of the whole country. The chief danger feared by all is the pleuro-pneumonia from the East. It was conceded by all, North and South, that cattle can not carry Texas fever. When driven any distance North the disease of itself disappears. But the pleuro-pneumonia is the danger about which the cattlemen are really nervous. In the event that Congress does not pass the required law, it is probable that the delegations will agree upon a series of uniform quarantine laws which they will ask their own respective States to pass."

The Governor of Missouri and the Mayor of St. Louis welcomed the Convention, and such distinguished men as General Sherman, General Curtis, Ex-Governor Fletcher and John Hogan were on the stage with these gentlemen. Major C. C. Rainwater, of St. Louis, was temporary Chairman, and he introduced the Mayor of St. Louis (Mr. William L. Ewing) to the audience. In a few well-chosen sentences that gentleman pointed out that no inferior figures could be used in numbering the products of the cattle industry. "They are told," he said, "by the million, and by the introduction of superior blood the character of the herds has been so improved that they bid fair to equal, in the near future, the ordinary farm-raised stock." Governor Crittenden followed in the same strain, giving special attention to the shorthorn and to the statistics of cattle raising in Missouri. General Sherman was called upon for a speech, and amidst a tumult of enthusiasm shook hands, figuratively speaking, with the cowboys, and wished all the health, luck and prosperity which the wild, natural and brave men deserved. Among the other distinguished visitors to the Convention was Captain Bedford Pim, of the British Royal Navy, who was present with Messrs. Bostwick, Hibbard and Bancroft, of the New York and Boston Cattle Co. Taking advantage of his presence in America on other business, he attended the Convention in order to gather all the information possible relative to the securing of cheap and good beef for the English people. "The great question in England," he said, "is the food question. To talk of attacking England by invading her shores is foolish. The best way to attack England to advantage is to send out a gunboat and intercept the ship bearing food to England, and the nation is conquered at once. With England and America united we can knock out the world. We will not have to knock them out, because we could starve them out without a blow. England has a limited area which cannot be increased one inch, and a constantly increasing population, and the problem of obtaining without interruption a constant supply of beef and breadstuffs is a great one. Here you have a great stock-raising and growing country, sufficient to almost supply the world, and the question is how best to bring the supply and demand into communication.

"As to shipping cattle to England to be matured there, I do not think well of it, for the reason that we have not the grazing land to fatten them on. What could England do with one million cattle

sent over to be fattened, and with thousands of additions coming on the heels of these? It cannot be done. The cattle must be fattened here and shipped alive as rapidly as possible, or shipped dressed and frozen. There was, at one time, prejudice existing in England against American beef, but there is none now to speak of, especially against cattle. Now, my plan is simply this: To ship or drive the cattle from Colorado and the lower ranges, or from Montana and other Northern ranges, to the most convenient port accessible to Hudson Bay. I think that ships for the purpose should be constructed; not immense, so that crushing by the ice would result in the destruction of large cargoes, but light, small ships, sailing vessels with only small screws and power enough to drive them through the ice when necessary. Little tugs, taken aboard and lowered when needed, would, I think, be amply sufficient for the purpose. The route through the East at present is too expensive a one, and, I may safely say, a week would be saved at least. The western winds would drive the ship directly to the English shores. Arrangements could be made at all of the English ports for feeding and caring of the animals before their distribution to English markets. I know all about the route, because I have been over it, and six years' experience in the ice made me entirely familiar with the difficulties to be overcome. There are no insurmountable obstructions in the way of the plan. However, I do not come here as an expert, but as a learner, and I shall look into the cattle question so as to be able to tell my people what can be done in this way. There is no English company ready to take hold of it as yet, but there need be no fear of lack of capital. The English people are careful, but they place great weight on the opinion of a man who has investigated and has seen for himself. There is abundance of capital ready to be placed in any sound, sensible and reasonable project."

Probably the most extraordinary feature of the Convention, which was permanently organized shortly after these speeches, was the extent of its representation. Connecticut, Maine, Kentucky, Arkansas, Rhode Island, Tennessee, Minnesota, Utah, New Hampshire, Oregon, Ohio, New York, Maryland, Pennsylvania, Missouri, New Mexico, Wisconsin, Wyoming, Colorado, Idaho, California, Illinois, Iowa, the Indian Territory, Kansas, Texas and Massachusetts were all represented by delegates at large, in addition to which there were special delegates representing almost countless cattle associations throughout the West, Southwest and South. We give a list of each stock-growers' or cattle association which was represented at the Convention, because of the significance of the list and of its importance as a matter of history. Many of the associations were short-lived. Several of them have long since gone to that bourn whence no traveler returneth, and a great many others have very wisely consolidated with larger organizations in their own States or Territories. But the list of associations as given below tells a story which can not be left untold in a history of the cattle industry, and hence we give it in full, extracting the names from the official proceedings, and more especially from the report of the Committee on Credentials. A perusal of it is recommended even to the man who always skips tables and statistics, because, read between the lines, it points a most important moral and adorns a most instructive tale.

Mr. John L. Routt, of Colorado, was made permanent President; Mr. M. N. Curtis, of New York, First Vice-President, and Mr. A. T. Atwater, of St. Louis, Secretary. An ivory gavel, the gift of the "NORTHWESTERN LIVE STOCK JOURNAL," of Cheyenne, was handed to the President, with which he rapped for order. The first business done at the Convention was the appointment of a permanent committee to draft a constitution for a National Cattlemen's Association, and Judge Carroll, of Texas, then moved that the Convention memorialize Congress for legislation for the establishment of a national stock trail, beginning at some point on the Red River and extending thence in a north or northwestern direction to the northern line of the United States. This question appeared to be, in the opinion of the delegates from Texas and the Southwest, the burning issue of the day, and a debate of the utmost importance followed. Mr. Carroll went so far as to say, more ingenuously, perhaps, than was quite politic, that it was *the* question which had brought the Texas delegates to St. Louis, and that it was the one question to which they would ask all cattlemen and those interested in the trade to give their direct attention. He argued that it was to the vital interest of Texas, and also the Northwest, to have this national trail established.

Gov. Stone, of Colorado, was equally strong in his support of the proposition, and Mr. Dorsey, of New Mexico, was another enthusiastic speaker on the same subject. Mr. Russell, of Kansas, voiced

another side of the same question when he said that several from his State had been burned already a good deal by the cattle trail from Texas, and did not want any more of it. Some of his friends from Texas went so far as to say that there was no such thing as Texas fever, but he knew to his sorrow that there was. If the trail was not proposed to go through Kansas he was not opposing it. The profit on cattle feeding had filled up Southwest Kansas with improved and improving herds, and he wanted them protected. Mr. Norman J. Colman, of Missouri, followed with a more temperate address, stating that if a trail was required it ought to be provided, and that Congress could attach such restrictions and precautions as would obviate danger of the character anticipated. The consumers of the North were just as much interested in the matter as the producers of the South. The former wanted cheap and good meat all the year round, and objected to being starved in summer and surfeited in winter.

Col. Stewart, of Montana, let some light into the cattle situation of the day by protesting against the expression in the resolution, "the breeding grounds of Texas to the maturing grounds of the North." The strip of ground, he argued, on both sides of the Rocky Mountains, from Texas to the British possessions, was a breeding ground for cattle, and he failed to see why Government aid should be asked for a trail to enable the Texas breeders to get their surplus stock through into the British possessions. Thousands of cattle had been shipped to market from Montana that year because the ranches were overstocked. He was perfectly willing that people should bring their cattle to Montana in the good, old-fashioned way, as he and his associates did. But he protested against Government aid being provided to overwhelm Montana with cattle.

Mr. Culver, of Kansas, speaking of the danger, actual and alleged, of Texas fever, said that while Health Officer of Dodge City he inspected four thousand six hundred and fifty head of cattle, all of which were healthy. Some of them on reaching Eastern markets turned out to be diseased. They did not get this on the cattle trail, but by being grazed upon territory upon which scattered and promiscuous herds had been grazed. He claimed that Texas cattle must have the right to go through the country, and that, in justice alike to the Texas cattlemen and those of more Northern States, a trail ought to be opened and fenced. Its exact location would then be known to all, and the danger of infection would be minimized. At a subsequent stage of the proceedings, three or four days later, a vote was taken, and the following memorial in favor of the opening of a trail as suggested adopted.

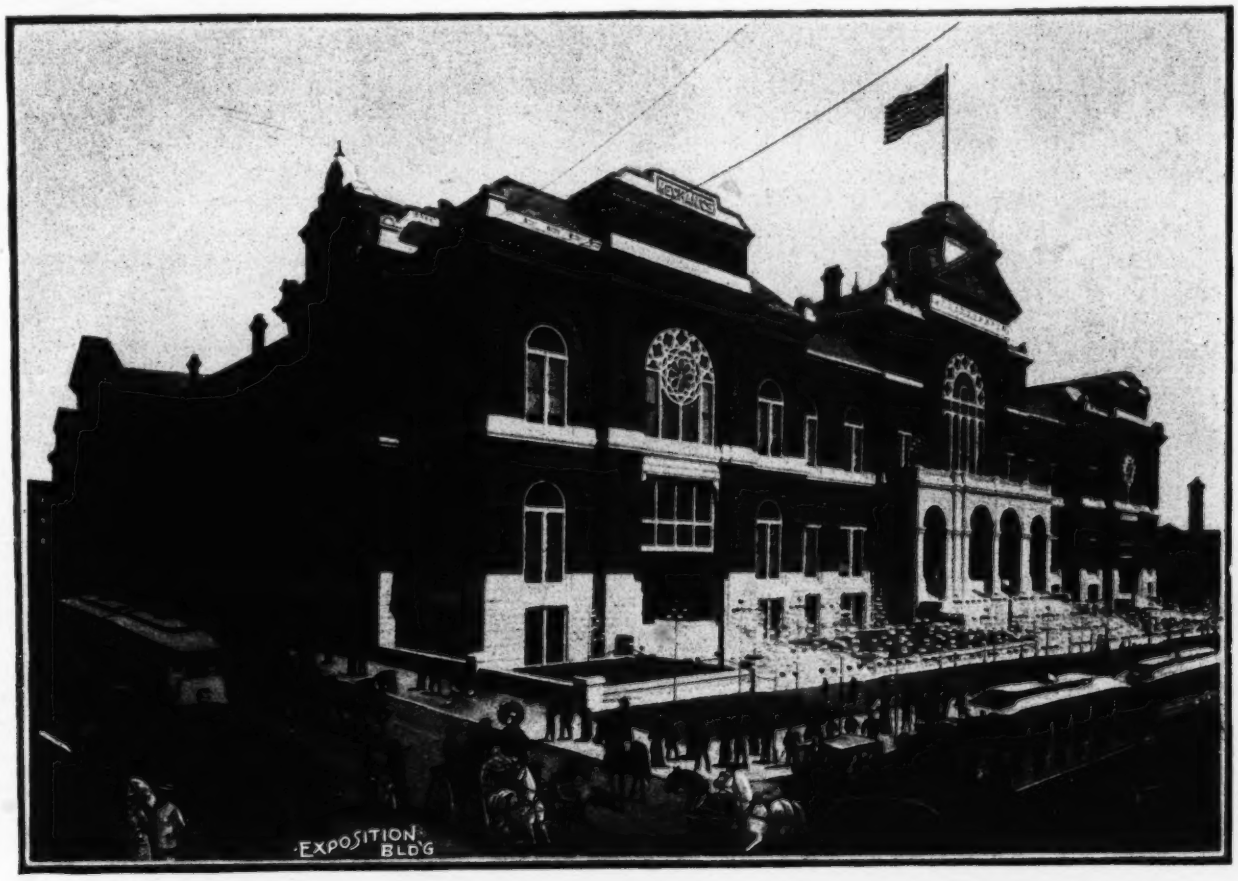
"To the Governors and Legislators of the States of Colorado, Kansas and Nebraska:

"We, the Executive Committee of the National Cattle and Horse Growers' Association, emanating from the first National Convention of Cattlemen of the United States, consisting of one thousand three hundred delegates, representing almost every section of the Union, which assembled in Convention, November 17th to 22nd, 1884, in St. Louis, Mo., do hereby present the following memorial and facts, to wit: The first National Convention of Cattlemen did memorialize the Congress of the United States, praying for the establishment of a natural highway, or cattle trail, from the Red River of the South to the British line on the North. Now, therefore, realizing that such proposed national cattle trail, or highway, must of necessity traverse the territory embraced within the boundaries of one or more of the States named herein, we do most respectfully ask your honorable bodies, at the earliest practical date, to declare and grant your consent to the establishment by the General Government of said national highway, or cattle trail, within and across the territory embraced within the boundaries of your respective States, it being understood and intended that said highway and cattle trail will be located upon unsettled domain, so far as may be practicable, so as not to in any manner interfere with any habitation or material interest, without first compensating such person or interest within the limits of your respective States."

Unfortunately, the trail referred to, carefully fenced in and so defined that no danger could possibly result from it, has not yet materialized, and it is more than doubtful whether it ever will. The minds of a great many of the delegates seemed to be vastly relieved, however, by the expression of their opinions and by the adoption of a memorial, and the Convention turned its attention to less controversial subjects.

The Committee on Resolutions handed in a report calling attention to the fact that large tracts of the public domain having been reserved for the exclusive use of Indians, permits were granted every year to large numbers to leave their reservations and hunt over ranges stocked with cattle.

This practice, it was pointed out, had a tendency to exasperate the rangemen and to provoke hostile collisions, and it was hence resolved that the Secretary of the Interior be urged to restrict all Indians, except those in the Indian Territory, to the limits of their respective reservations. General P. Porter, of the Muskogee and Seminole Live Stock Association, spoke at length on this resolution. Taking the Indian side of the everlasting controversy as to the policy to be adopted toward the red man, he spoke in a most feeling manner of the rights of the Indians. In the Indian Territory, in which a great number of those present owned cattle, herds were grazed upon Indian lands by mutual consent. Out of this agreement the cattlemen derived a large income, and the Indians also were learning to own cattle and make money for themselves. The resolution might be very applicable to other States and Territories, but he did not think it was applicable to his district. He thought that the depredations of



WHERE THE GREAT CONVENTION WAS HELD.

the Indians, as well as the encroachments of the cattlemen, were greatly exaggerated, and he was afraid that the preamble, as worded, was calculated to increase the differences between the two classes.

Dr. Moore, in the course of a warm speech, said that the resolutions had reference only to the Indians of New Mexico, Southern Colorado, Arizona, Montana and Wyoming. "In these sections," he said, "every year we are depredated upon by these bands of roaming Indians just in the manner recited in this preamble. I have no objection whatever to striking out the preamble, except that the preamble contains the reasons of the resolution. I submit to the candid consideration of the Convention that those reasons are no more in the interest of the cowboy than they are of the Indian; that they are in the interest of peace and equity, and in the interest of the General Government, and that the preamble carries along with it the very reason why that resolution ought to be unanimously adopted by

this Convention, and the last man upon the floor of this Convention to object to resolutions like that, which pays him and his associates of the Indian Territory the high honor of excepting them from all the other Indians of America, the very last man is he who ought to object to the passage of the resolution and the preamble which explains it.

"I have had my range burned over; I have during the past year ridden for three days through fire still burning, which the concurrent testimony of every cowman in my region asserted was the result either of carelessness or the criminal intent of roaming bands of Indians, who were depredating upon those ranges stocked with our cattle. I, therefore, in the interest of the Indians on the one hand, and in the interest of civilization on the other, for I will not do my brother the disservice of saying that as the carboniferous ages preceded the ages of animal life, and I will not make the application only to say that wherever in the great march of civilization there is standing in the way any obstruction, whether it be in institutions social, or in institutions of race, those obstacles must be lifted out of the way; civilization has the right of way to the centuries that are to come. I appeal to you, I again say, in the interests of the Indians on the one hand, and of the National Government on the other hand, and of peace everywhere, that these resolutions and the explanatory preamble ought to be adopted."

Gen. Brisbin and Mr. Pollack, of the Indian Territory, spoke in opposition to the preamble, and expressed an opinion that it was unnecessary, as the Indians and the cattlemen were getting along well together. This brought to his feet Mr. Stuart, of Montana, who spoke in a very different vein, and pointed out that, however matters might be in the Indian Territory, the Indians and the Government, between, them did a great deal of injury to the stock interests of his section of the country." We only ask," said he, "that the Indian be kept on his reservation. We pay taxes to feed and clothe him. In Montana there is that state of affairs. The Indian is not to blame. I sympathize with him, and have always done so, and my life shows it. It is the atrocious policy of the United States that is to blame, and not the Indians. They put them on reservations and pretend to feed and clothe them, but they don't half do it. Then they give them permission to leave their reservation and go and prey upon one another; to murder, and steal horses from one another. That is what the United States permits the Indian to do to-day in Montana; it is done daily and hourly. The Indian is not to blame and never was. He is a much-abused individual, and I will stand up for him, even if he does steal my horses once in a while. It has occurred in the history of Montana, not long ago, that an Indian agent, in charge of a powerful nation, paid them five dollars a head for every stolen horse they would bring in, and he taxed the owner twenty-five dollars for them. We want the Indian to have his rights; we don't want him to be robbed; we want him protected; I want him to be as much a citizen of the United States as I am. But we do detest and abhor that policy which says, 'Go and steal from your neighbor Indian; kill him, if necessary, and we will wink at it.' The Government never has prosecuted one of them yet for doing that, and never will prosecute one in the Northwest."

Mr. Gosper, of Arizona, was equally eloquent as to the difficulties the Indians interposed. "I have lived in Arizona eight long years myself," he said. "I have looked the Indians in the face, and I know, as it is well known to all you men who have read the dispatches relating to Indian depredations in our Territory, that hundreds of thousands of dollars have been destroyed by those Apache Indians, in the shape of freight, teams, cattle and horses, in their having left the Indian reservation—the San Carlos Reservation—not under the consent or guiding hand of the Secretary of the Interior, but against his orders. I say to you it will be an imperishable insult to the frontiersmen, those who have dared to take their lives in their hands and face these murderous Indians, if you shall oppose, or rather rescind, the preamble to this resolution and destroy the resolution itself. That preamble simply recites the facts, which are these: That the Indians do leave their reservations; that the Indians do steal and destroy our property. It does not say they destroy our lives. It might be well added in the preamble that they destroy our lives as well as our property. I say to you it will be an insult to American civilization, to American enterprise, to the fitness of things in this nineteenth century, if you rescind that preamble. I hope that the good sense, the good character and the wisdom of the men that are here to-day, who vote upon this proposition, will not let them stultify themselves and the knowledge of the facts that they know, or ought to know in their positions, and vote down the preamble and resolution that does not cover one-half the facts that are true out in our mountain region. Over in your section, Mr.

Stuart, it may be altogether different. We hope it is. God be blessed if your lives are safe and your property is safe! But, in the name of justice—in the name of righteousness—don't oppose a measure that can do you no harm if passed. We have been fighting, in this Western country these many years, this ignorant sentiment that the Indian is a better man than the white man. That is not the case. You talk about the Indian starving and never offering to go off his reservation to get something to sustain life with. I have been upon the San Carlos Reservation. I have seen the Indians come up to the Quartermaster's Department and take their grub—as we cattlemen call it—in large quantities. I have seen the beeves slaughtered, and have seen them carrying it off on their shoulders. They are better fed to-day, in my Arizona country, than the poor men who are riding the bronchos over the plains, and hunting the mineral hidden away in the mountains."

The debate acquired exceptional interest from the fact that it was construed, in some quarters, as an attempt to secure Government sanction to acts of aggression on the part of cattle feeders, who were accused of anxiety to secure control of Indian lands without legal process. Nothing that was said seemed to justify this contention, although it was made with considerable vigor and even bitterness. Finally, the resolutions were referred back to the committee, by whom they were amended so as to strike out the more objectionable features. The compromise read as follows:

"Whereas, The Indians in various sections have been virtually forced, by the inadequacy of their supplies, to forage outside of their reservation; and whereas, in New Mexico, Arizona, Colorado, Wyoming, Nevada, Montana, Eastern Oregon and Dakota, permits are given each year to bands of Indians to roam at will over the lands beyond the limits of their reservation, whereby great damage by fire and depredation is entailed upon the live stock industry, and hostile collisions with rangemen made imminent. Now, therefore,

"Be it resolved, That it is the sense of this Convention that all the covenants of the Government with the Indian should be most scrupulously and honestly carried out, and that the Indians named in the preamble, having been granted the exclusive use of vast areas of public domain, should be rigidly restricted to the limits of such reservations."

These resolutions met with general approval, and were adopted without further debate. The attitude taken by the cattlemen in regard to them is of especial interest at this time, in view of the repeated allegations made against the rangemen, at frequent intervals, of oppression toward the Indians. As a matter of fact, no body of white men have got along more comfortably with the Indians than those engaged in the breeding and feeding of cattle. Where the Indians have displayed any desire at all to fall in with the existing conditions, and to engage in agricultural or similar pursuits, the cattlemen have treated them as neighbors, and have been their best friends. It is only when theft and criminal carelessness have been characteristic of the much-pampered and much-abused redman, that the pleasant relations have been suspended. In the Indian Territory, particularly, the cattlemen have taken the part of the Indians against the Government in countless cases of attempted oppression. It would, indeed, have been a good deal better for the Indians, both financially and socially, had the Government interfered less to hamper the stockmen, and to encourage promiscuous settlement by so-called "boomers."

Copies of these resolutions were forwarded to the Secretary of the Interior and to the Commissioner of Indian Affairs, and, to some extent, the result was satisfactory.

The next question which occupied the attention of the delegates had reference to location. Mr. Dwyer, of New Mexico, argued that experience had demonstrated that beef cattle could be more economically raised in the arid and elevated portions of the country than elsewhere, and that the vast plateau lying between the ninety-eighth meridian and the Sierra Nevada Mountains was better adapted for this purpose than any other part of the United States. Under the existing laws, he pointed out, the occupants of this region were unable to acquire title to land in such quantity as to guarantee permanency and security in their business, and to justify such improvements and expenditures as had been made in other States. These lands could be leased for a term of years with profit to the Government without, in any manner, conflicting with existing homestead and pre-emption laws. More than three hundred million dollars had already been invested in live stock within the limit specified, although the owners of these herds had been unable to lease or purchase the lands, holding them only by

possession and sufferance, and their property was in constant peril from conflicting claims. He argued that the beef raised on these plains had become an important factor in foreign trade, increasing in greater ratio than any other product, and would, if properly protected, become at an early date the most important article of food supply sent from America. Under these circumstances, he believed it to be the duty of the Government to aid the industry in every way consistent with the general welfare. With these ends in view, he asked the Convention to memorialize Congress in favor of leasing the lands referred to for a term of years, reserving all the rights to actual settlers under the homestead and pre-emption laws, and excluding California, Nevada, Oregon, Utah and Idaho from the operation of the proposed change.

The matter was sent to the Committee on Resolutions and acted upon favorably.

Our old friend, Mr. McCoy, whom we have quoted so frequently in this work and whose impetuosity was one of the few almost amusing features of the great Convention, brought up the trail question again. He was anxious that the proposed trail should be not more than six miles in width, and that it should be contracted to a width not exceeding a hundred feet at convenient points, in order that by bridges, arches or other devices herds of cattle might be safely crossed over any national highways or live stock trails.

The last business on the fourth day of the Convention was a resolution to form a National Live Stock Association, and to commence active work therewith immediately after the close of the Convention. The fifth day was occupied very largely with a very vigorous discussion upon the proposed constitution, which was printed in the morning papers before being brought in detail before the Convention at all. As the constitution was commendably brief, and as a great many points of importance were involved in it, we reproduce it in full, as it was finally adopted:

1. The name of this association shall be "The National Cattle and Horse Growers' Association of the United States."

2. The object of this association shall be to promote, in every legitimate way, the cattle and horse industry of the United States.

3. Any person directly connected with the cattle or horse growing industries of the United States may become a member of this association by paying to the treasurer thereof an admission fee of five ($5.00) dollars; and any association of cattle or horsemen may become a member of this association by paying an admission fee of fifteen ($15.00) dollars.

4. The annual dues of each member and association shall be fixed by the Executive Committee, and shall not exceed two dollars and fifty cents ($2.50) for each member, and seven dollars and fifty cents ($7.50) for each association; provided, no member shall be required to pay annual dues until he has been one year a member of the association.

5. The officers of this association shall be a President, a First Vice-President, and one Vice-President for each State and Territory represented in this association; a Secretary and Treasurer, each of whom shall hold his office for one year, and until his successor shall be duly elected and qualified.

6. There shall be an Executive Committee, consisting of fifteen (15) members, to be elected at each annual meeting of this association, and eight (8) of whom shall constitute a quorum for the transaction of business; the President of the association shall be ex-Officio Chairman of the Executive Committee.

7. The business of the association shall be managed by its Executive Committee, which shall be empowered at all times to do, and to procure to be done, such things and expend such moneys as in its judgment will promote the best interests of the association. It shall have control of the investment and expenditure of the funds of the association, and make frequent examination of the books of the Secretary and Treasurer. It shall, at its first meeting, adopt a code of by-laws for the government of the association, which may be altered or amended by the Executive Committee or the association at any annual meeting.

8. The chief office of this association shall be in St. Louis until otherwise ordered by the Executive Committee.

9. No officer, except the Secretary, shall receive any salary.

10. An annual meeting of the association shall be held on the fourth Monday of November of each year at such place as the Executive Committee may determine; and each member of the association shall be entitled to cast one vote at such meeting. Local associations belonging to this association shall be entitled to three votes. Each State and Territory shall be entitled to one delegate at large, duly accredited by the Governor thereof.

11. Nothing in this constitution shall be so construed as to prevent any cattle or horse grower from the Republic of Mexico or the Dominion of Canada, who is a member of some regularly organized cattle or horse growers association, from becoming a member of the National Cattle and Horse Growers' Association of the United States, by the consent of this association.

12. This constitution may be altered or amended at any annual meeting of the association, by a vote of not less than two-thirds of the delegates present.

It was generally believed that the association which was to be governed by this constitution would promptly assume proportions of great magnitude, and that its influence over and upon the cattle trade of the country would be prodigious. Under these circumstances it can be easily understood how eagerly the details were discussed, and how exciting were the debates which followed their perusal. Mr. McCaskill, of Colorado, complained strongly of the basis of representation at first proposed. He pointed out that for the first time in the history of the cattle trade there had been a grand gathering of cattlemen from all parts of the country. Many of them had become acquainted for the first time, and the industry being in its infancy, it was most important that these relations should be maintained. He was afraid that as originally drafted this constitution would take the control of the association out of the hands of the cowboy and place it in the hands of the professional politician.

Governor Stone, of Colorado, argued in favor of State and Territorial representation, even when there were no associations in such States. As a Democrat in spirit and principle he wanted to have full representation, and did not think the constitution as arranged would meet the case.

Mr. Wood, of Missouri, Chairman of the Constitution Committee, defended the original draft of the constitution, which, it may be explained, differed in some respects from the articles as finally agreed upon. In regard to the question of representation by associations, there were two sides to it. He represented an association whose invested capital in the cattle industry did not exceed a quarter of a million dollars and whose membership was about twenty. There was represented in the Convention an association from Wyoming representing millions upon millions of dollars invested in the cattle industry, and representing hundreds of men who ought to have more representation than a solitary twenty. In Texas again there were twenty associations, and in Montana one, and he failed to see how they could adjust the difficulty except in the way suggested.

Judge Thornton, of New Mexico, in a speech full of feeling, said that the association was designed for men who had left their homes in the older States and gone into the broad deserts, where they had turned the home of the buffalo into the meat-producing country that was feeding the nation. These men wanted not a live stock association, but a cattle growers' association. It was not desired that raisers of all kinds of live stock should be able to out-vote the cattlemen, especially as the interests of the cattlemen were great enough to have an association of their own. The Territory he represented would be shut out by the proposed system of representation, and he was strongly opposed to it.

Mr. Gosper, of Arizona, referred to the National Convention of Live Stock Men held in Chicago in 1883. That Convention, he pointed out, had been called by the Agricultural Department for two purposes. One of these was to secure the passage of the animal industry bill, and the second was to call a second annual Convention of Live Stock Men to organize a permanent association. That second annual Convention had been held the preceding week in Chicago, but for the purposes of harmony it had been suggested that there should be but one National Live Stock Association instead of two. It looked as though there would be a division of the men from the Northwest and from the Southwest, but the olive branch had been held out, and it appeared as though they were to have one association and general harmony.

Mr. McCaskill then made a most earnest appeal on behalf of the cowboy and the cattle raiser. "I was the man," he said, "who made the assertion that this would run into a political organization. I believe I was the man who made that statement. I am willing to stand by that statement. I think

that I can prove to every man in this house that it is absolutely true. I ask the boys in the far West, that live in Wyoming, Texas, Colorado and New Mexico; I ask the boys that own the cattle; I ask you where you are to be found? You will find them in the spring of the year, when the grass is green, in the saddle—from that day until the snow falls. Then, if they are out in the saddle from spring until fall, they are not where they can get to any post office, and they cannot leave their places of business for the purpose of going to the State capital, and there meeting in Convention and electing delegates to a National Convention. Some of those gentlemen in Wyoming, in Texas and New Mexico, would have to travel from one hundred to one hundred and fifty miles on horseback for the purpose of getting to that Convention to have any representation. Then who would be the men that would elect delegates to this National Convention? It would be the men that have assembled around the capital—that are living there and want to attend the Convention. They would get together, and the vast body of men that live in Texas, Wyoming and New Mexico, that are out watching the heavens by moonlight, who by sunlight are in the saddle, they go without any representation. I do say that it will end in a political organization, and the object for which you and I are here to-day, as cowboys, from the West, would go down without representation—it would end in nothing. But what we want, and what we have come here for, is for the purpose of organizing that we may meet as cattlemen and look out for our interests. The gentlemen said a while ago that in Missouri they have no men who represent millions of dollars invested in cattle as they have in Wyoming. I ask you, have we come here to be represented by the dollars and cents that a man has in his pocket? If I have but a hundred cattle, and I am in the saddle, it is everything that I have. I am just as much interested in that hundred head as that man that owns his ten thousand that run upon the plains. Have I no voice because I am not represented?''

Before the discussion of the constitution was taken up, clause by clause, the Conference Committee, which had been appointed to secure harmony between the interests represented by the Convention held in Chicago the preceding week and the Convention then being held, presented its report. Mr. Curtis, of New York, on its behalf stated that it had been found impossible to finally agree upon an arrangement whereby only one association should be organized at this time. It was believed and hoped that in the future an agreement of this kind would be come to, but at present it appeared to be hopeless.

Judge Carey, of Wyoming, followed up Mr. Curtis' remarks with some strong expressions of opinion on the subject. As a representative of the great Northwest, he said that he and his colleagues felt very much like the peculiar animal known to cattlemen as a ''maverick.'' He spoke as a representative of some fourteen associations that had been merged into the Wyoming Stock Growers' Association, and he wished to point out that there were men in the Northwest who, for four or five years, had been striving earnestly to secure that class of legislation which would benefit the stock industries of the country. He believed that if a convention could ever be got together that was composed of men engaged exclusively in stock growing interests, no question would arise that would separate or divide them. The Convention held in Chicago the preceding week was a Cattle Growers' Convention in every sense of the word, and the people of Chicago had not taken a part in it. It had organized a National Cattle Growers' Association of America, the purpose of which was to develop the cattle industry of the country. Their design was to have as members not men who sold cattle on commission, who sold hay to cattlemen, or who made a business of shipping cattle, but simply men who were cattle raisers. He failed to see how the Northwest was associated with Texas and the cattle industry. During the last ten years the Northwest had bought millions upon millions of dollars' worth of cattle in Texas, and he failed to see why Texas cattlemen would take the view they did in regard to this matter. The association with which he was connected (the Chicago organization) had selected as its officers men from all parts of the country. These included a representative shorthorn man, a representative Holstein man, a representative Jersey man and a representative plains man. If there were differences between the two newly-formed associations, let them get together and close them up.

Mr. Colman, of Missouri, in answering this argument, said that the Chicago association had made so little a ripple upon the stream of time, that he believed nine-tenths of the present Convention had never heard of it. If everything was to be controlled by the North, it was good-bye to the cattle industry. He wanted all sections and all people to unite in the cattle interest, and everything had been done that honorably could be done with a view to coming to an agreement. The policy adopted by

the other side of the question had been that those at Chicago were holier than those at St. Louis, and, although every desire had been manifested to yield points, nothing would be yielded in return. If they would allow the Chicago people to become the tail to wag the dog it would be all right, but the cattlemen, as represented in this great Convention, did not propose to allow this to be done, and he failed to see what hope there was for an agreement.

A number of motions were then made to amend the constitution, but, for the most part, they were voted down, and, finally, the constitution as printed above was adopted as the basis of operations for the new association.

The Committee on Resolutions called attention to the fact that it was the custom of certain railway corporations in the United States to furnish for the shipment of cattle over their lines of road boxed or closed cars only, thereby causing great danger to the shipper of loss of property, and discomfort, cruelty and disease to the cattle so shipped. It recommended that Congress be memorialized to secure legislation to compel all railway companies of the United States to furnish slat or special stock cars for the shipment of cattle. The resolution was adopted, and although there has not been much legislation on the subject, the evil complained of has been abated and a very superior grade of cars introduced.

This, practically, concluded the proceedings of what we have already described as, perhaps, the greatest Convention ever held. As we shall see later, the results were not what had been hoped, and we have already referred to the suggestion that the tremendous hurrah which characterized the gathering proved injurious to the trade and helped to reduce the profits of cattle growing. But this does not alter the fact that the Convention was a remarkable gathering, and one which will never be forgotten by any one who was present at the proceedings. All sorts of estimates as to the amount of money represented were made at the time, and the number of millions owned by those present was talked of in an undertone and with bated breath. Every branch of people connected with beef production was represented. Gen. Preston Porter, some of whose remarks we have reproduced, represented the American Indian with singular ability. As a member of the Creek Nation he spoke on behalf of his race in a manner which demanded and obtained recognition, and the information he gave concerning the relations between Indians and cattlemen were of the first importance. D. W. Lippe, Treasurer of the Cherokee Nation, and Chief Perryman, were other notable Indian representatives, while among the white men there were some of the most remarkable examples of courage and success. Those who attracted special attention, says Mrs. Augusta Wilson, of Parsons, Kan., in her review of the Convention, were: "Gov. Routt, ex-Gov. Stone, Gov. Eaton and ex-Gov. Gilpin, W. H. H. Cranmer, Finis Ernest and Andrew Wilson, of Colorado; ex-Commissioner of Agriculture Le Duc, of Iowa; and from the military ranks came Gen. Brisbin, of Idaho; ex-Gov. Hadley, and ex-Senator Stephen Wallace Dorsey, the great statesman and noted ranchman, of New Mexico; and from the great State of Texas came such notable and noble men as ex-Gov. Joseph D. Sayers, Hon. James F. Miller, Judge Carroll, Judge Lindsay, the silver-tongued orator and Congressman-elect from the Galveston district; Hon. W. H. Crane, also Col. E. R. Lane, and prince of ranchmen, Richard King, and that most popular drover of this or any other era, Col. John T. Lytle; and also that veritable living encyclopedia of 'brands,' Richard Head, accompanied by such solid millionaire ranchmen and drovers as Col. John Simpson, and Col. J. L. Driskill, whose immense herds crop the nutritive grasses of Montana; also Col. J. M. Day, the true-hearted, old-time drover and now solid ranchman; Capt. Ike Pryor, and the notable Col. A. H. Pierce, whose wealth and energy are equally and phenomenally large, and now last for Texas, but not by any means least, the name of the solid and model business man and millionaire, Col. Charles Goodnight, of the Pan Handle, and the courteous and dignified banker of Beaumont, Col. V. Wiess; Col. Carter, and Mr. Sheperd, and Loving, the Secretary of the Northwest Texas Cattle Association. From Illinois came as a delegate at large from that State that brilliant parliamentarian and shorthorn stockman, Hon. De Witt Smith, and Mr. Dunham, of great horse fame, both in the United States and in Europe; and from Chicago a very large representation, prominent among them was that noble, philanthropic gentleman, Dr. Wood, of Wood Brothers; and from the Empire State, New York, came the towering parliamentarian, Gen. W. M. Curtis, whose honorable service in civic and military fields alike fills pages of our country's grateful history; and from Kentucky, the home of the shorthorn, came the solid, matter-of-fact, brainy Col. Groom. From Missouri State came the earnest and able Capt.

James H. Payne, and from Kansas City the solid millionaire, Andrew Snider, and the philanthropic Thomas J. Allen, the Chesterfieldian Maj. Seth Mabry, and the chivalric Capt. E. B. Millett, and the noble-hearted connoisseur horseman, Col. S. S. Grant; and from St. Louis the towering headlight of the Convention, R. D. Hunter; the stately Capt. A. G. Evans, and James C. Moore, of the Merchants' National Bank, whose honor and integrity are as firm as the rock of ages. From Kansas came the Hon. L. E. Finch, and the eloquent and impetuous McCoy; and from Colorado and New Mexico and Arizona and California and Idaho and Nevada and Utah came a galaxy of men who already had national fame; and from Montana came the erudite Ames; from Nebraska, C. J. Davis, and from Wyoming came Judge Cary, and Mr. Curtis, Secretary of the Wyoming Live Stock Association; but to Colorado belongs the palm of furnishing the prince of scholars and orators, Dr. Moore."

Immediately on the adjournment of the great Convention the organization of the National Cattle and Horse Growers' Association was perfected. Col. R. D. Hunter was elected President, after having been nominated by Dr. Moore, of Colorado, who rejoiced, perhaps a little prematurely, in the fact that all animosities had been buried, and argued that harmony would be still further promoted by the election to the presidency of a man like Col. Hunter, who had worked his way up in the business by his own industry, and who could so ably represent both cowboy and capitalist. One or two other candidates were nominated, but every one was united in favor of the Colonel, whose election was really unanimous. Vice-Presidents from the different States and Territories were then announced. Alabama, Arizona, California, Colorado, Dakota, Delaware, District of Columbia, Idaho, Indian Territory, Illinois, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Missouri, Nebraska, Nevada, New Mexico, New York, Oregon, Pennsylvania, Texas, Utah, Alaska, Canada and Mexico were all duly represented on the roll of Vice-Presidents, but neither Wyoming nor Montana responded to the call. General fears were expressed that these States had jumped the Convention and were not going to give a very hearty support to the Association.

This fact was not allowed to interfere with the progress of events, and a strong Executive Committee was appointed. Mr. A. T. Atwater was made Secretary of the Association, and Mr. D. C. Moore, of St. Louis, Treasurer. A committee was appointed to take into consideration the foreign trade and commerce in cattle and beef products and legislation relating thereto, and to report at the next annual meeting of the association.

The fifteen members of the Executive Committee met in the rooms of the Colorado delegation immediately after being appointed, and the next place of meeting was the first question discussed. Denver, Chicago and St. Louis were the three contending places. The Western members stated that the majority of the delegates were from the West, and that Denver would be much more convenient. Chicago, while admitting the superb manner in which St. Louis had entertained the delegates, claimed that the great cattle interests of their city demanded recognition, and that the delegates would appreciate a change. For St. Louis, it was maintained that the three most important officers were here, and that St. Louis possessed, in the highest degree, the ability to handle conventions. This was so evident, that when a vote was taken, St. Louis received twelve votes, Chicago one, and Denver two. The Denverites gracefully withdrew in favor of St. Louis, but Mr. Dunham, of Chicago, solidly refused to ratify. It was, nevertheless, unanimously voted to hold the second session of the great Convention in this city, November 23, 1885.

The following sub-committees were then appointed:

On Branding—B. H. Roberts, Titusville, Pa.; H. Metcalf, Denver, Colo.; H. B. Denham, Brooklyn, N. Y.; J. S. Brisbin, Boise City, Idaho; E. R. Lane, San Antonio, Tex.

On Leasing Lands—Gov. Stone, Colorado; Col. Babbitt, Wyoming; Judge Carroll, Texas; J. S. Brisbin, Idaho; W. T. Thornton, New Mexico; Gen. N. M. Curtis, New York.

A sub-committee, with all the powers of the full committee to act under certain circumstances, left to the discretion of the Chairman, was then appointed, the members thereof being: M. W. Dunham, Wayne, Ill.; Colonel Hamilton, Richard Gentry, H. E. Salmon and J. L. Brush.

Thus one of the greatest national associations ever contemplated started out with every prospect of success. The reaction from the exceptionally high prices which marked the culmination of the great boom in the trade had already set in, and it was felt among the cattlemen that organized effort was

necessary for the protection of their interests. It would be pleasing, if it were possible, to record a long list of results of the association's work, such as we are able to do in a later chapter concerning the great Texas association. But truth compels us to record, as a matter of history, that the association proved a failure. The Convention of 1885 lacked the tremendous force of that of 1884, and showed that the unanimity between States and sections necessary to make an organization of cattlemen all-powerful was painfully lacking.

We need not go fully into the circumstances connected with the decline of what looked like being, at one time, an organization of tremendous, if not dangerous, power. In the words of one of its prominent officers, "it never died, it just slept." It passed resolutions in large numbers, and sent memorials to Congress and to State Legislatures very frequently. But it failed in point of action, just as did nineteen-twentieths of the long list of cattlemen's associations represented at the Convention and published on a preceding page of this chapter.

A well-known cattleman, not a resident in Texas it may be added, was asked by the writer his opinion as to how it was the association, and so many of the smaller organizations represented in it, failed to mature in the manner expected, and hence passed out of existence without achieving the desired results. "The only reason I can suggest is that there was too much theory and not enough practice in the policy adopted," said the gentleman referred to. "I remember, not long ago, a colored man in my employ joined a political organization, and for a long time seemed exceedingly proud of his connection with it. After awhile the organization seemed to lose favor in his eyes, and one day, when I asked him how it was getting along and what it was doing, 'Oh,' he said, with something of a sneer, 'we don't do nothin'; we just resolute and resolute, and that's all.' Without meaning any disrespect toward the cattle associations which died of inanition, it seems to me that my darkey's description of the *modus operandi* of his society fits them exactly. The cattleman and the cowboy are busy people, exceedingly practical in their ideas and averse to a mass of words. The only time that the Northwest Texas Cattle Raisers' Association was in any danger of disruption was when it lost sight, for a short time, of its main purpose, and tried to achieve results by memorials. Directly it braced up, and resumed practical work, its strength became greater than ever, and it is to-day a power for good, not only to the Texas cattleman, but to the cattle industry of the country generally. Its programme has been clean-cut and defined, and it has spent its money and energy on an effort to put a stop to cattle stealing. The results of its work have been extraordinary, and as "deeds rather than words" is still its policy, it stands a chance of rising to still greater importance. If the other associations throughout the country had turned their attention to practical, every-day matters which they could control or influence, instead of going into abstract theories and sciences, they would certainly have achieved great results and been in good shape to-day."

Another well-known cattleman expressed his view on this subject in the form of an interview which was published in the winter of 1887. "Up to the fall of last year," he said, "it had been the rule among stockmen to ship no cattle to market younger than four-year-old crib steers. Last fall a few cows and calves were sent to the stock yards and sold, and even then the stockmen who were doing it were severely criticised. The explanation then generally given was that the ranges were overcrowded and that the owners wanted to get rid of the cattle. Early this year the stockmen began to ship yearlings, cows and calves into the yards in such large numbers, that it became evident there must be some other cause for their desire to clear off the ranges. There was another explanation, and this was debt. According to the books of the stock yards company there were in 1886 no less than two hundred and fifty-seven thousand cattle shipped to the East St. Louis stock yards and sold there. These were mostly beef cattle. For the past ten months of this year there have been forty-five thousand more cattle shipped to the yards than were in the whole of last year. Of these, the cattle inspectors stationed at the yards say, fully one-half have been cattle that should not have been put on the market, and would not have been shipped two years ago. It is quite true that the cattlemen in some parts of the Northwest and Southwest have found that they made a mistake by overcrowding their ranges with stock, and are trying to thin out their herds by shipping the worst of their cattle to market; but the shipment of the immature beef cattle are due more to the pressure of the stockmen's creditors upon them. They have been getting into debt ever since 1884, when the cattle business appeared to every-

body to be the best speculative investment that could be found for loose money. Two years before that Texas cattle had sold in the stock yards for seventy-five dollars a head, and for three years the cattlemen all thought they were going to be millionaires.

"These were the days of the cattle king and of vast wealth in cattle, when the stock grower counted his assets on paper. He had so many thousand head of cattle on his ranch worth thirty dollars and more per head. He mortgaged his cattle for their full value and bought more cattle to put on his ranges. Then came a succession of heavy blows to the stockman, and those in Texas suffered most. The cattle began to die on the overcrowded ranges because of bad water, scarcity of feed and extreme warm weather. Texas passed a law to compel the cattlemen to pay rent for their ranges. At first the States charged them eight cents an acre for the dry lands and twenty cents for the watered lands, but afterward reduced the range rent to four cents an acre for all kinds of lands. The Texas stockman counts twenty acres of land as barely enough pasturage for one head of stock, and that four cents rent meant eight thousand dollars a year to him if he had ten thousand cattle. The supply of beef greatly exceeded the demand in this country, and Europe, beginning to import its beef from Australia and New Zealand, got less and less from America. The price of beef fell rapidly, growing lower every year after 1884, until now it is not one-fourth what it was in 1882. An average price per pound for beef on the hoof then was four and one-half cents, now it is about one and one-fourth cents. Loss by death followed loss by decrease in price until the cattlemen grew discouraged, lost heart and began to try to sell out of the business. But they found no one to buy. The jubilant Cattlemen's Conventions of 1883 and 1884 became meetings in 1885 for the purpose of exchanging condolences with each other, and in 1887 they were not held at all. Several failures of heavy cattlemen added to the panic in the business, and the cattlemen finally almost grew to believe that their herds were not worth the salaries of the cowboys paid for watching them."

So far as the National Cattle and Horse Growers' Association is concerned, it was also hampered and injured by a feeling of sectionalism. The old Chicago and St. Louis feud was allowed to interfere with it at the very commencement of its career, and the feeling of antagonism between the Northwest and the Southwest, which at times came to the surface during the big Convention, grew instead of declined as time passed on. As far as possible, controversial points are not dealt with in this book, and hence it is unnecessary to go into details on this point. We have shown, at some length, how grand and important the Convention was, and we have done so because we regard that gathering as an infallible mirror, depicting the condition of affairs which prevailed when the cattle industry of the West and Southwest was at the very zenith of its greatness and prosperity. In the next chapter we shall, with the same object in view, consider the range industry as it existed about ten years ago. It will also be necessary in this connection to trace the causes which led to the falling off in the industry's prosperity, and the evening-up of matters of the cattleman's grievous discomfort and heavy loss, not omitting a few remarks on the next cycle, and on the dawn of renewed prosperity for the last few years of the century.

CHAPTER VIII.

The Condition of the Cattle Industry Just After the Great Boom.

IN the preceding chapter attention was drawn to the immense importance of the Cattle Convention of 1884, and also to the interest this Convention attracted in all parts of the country from all classes of people. Mention was also made of the fact that some people, not necessarily habitual pessimists, took the view that the Convention was ill-advised, because the extraordinary prosperity, and in some cases immense wealth, of cattlemen was brought so prominently to the front that many were induced to a false belief as to the profits to be made out of cattle raising and the impossibility of losing money in the business.

One immediate result was attracting the attention of the Government to the cattle industry, resulting in the prosecution of inquiries in a manner never before attempted. Much benefit was derived from the efforts made in this direction during the years 1884 and 1885, and especially the latter year; and to Mr. Norman J. Colman, then just appointed Commissioner of Agriculture, the industry is indebted for the first really thorough investigation made. Mr. H. M. Taylor prepared for Mr. Colman a most valuable report on the importance of the range industry of the United States. In this report Mr. Taylor called attention to the fact that the cattle industry of the great West represented at the time mentioned, or about ten years ago, in its annual results, nearly two million beef steers added to the food supply of the world. It was true that quite a large per cent of these (fifteen to twenty-five) were sent to the corn belts of the old West and ripened, but the carcasses were grown on the plains. This was about one-third of the annual beef supply of the whole United States, and if cut off would create a beef famine in the land. Under these circumstances it was important that the West should be encouraged in the direction of continual production. With this great beef reserve to draw from, the working classes of the East were scarcely able to buy adequate supplies. Without this resource, prices would advance to such an extent that only the rich could eat beef at at all.

The prominent cattle ranges he found to be in the arid regions. Large areas on the edges of these regions had been used as ranges in the past, but the farmer with his plow had now taken possession of such places, and the herds were naturally driven to the bad lands, and such places where agriculture was actually impossible without irrigation. This movement was, and is, strictly in harmony with the laws of nature. Every district of country in the United States that is susceptible of cultivation, and that, without artificial water supplies, will respond to the touch of the husbandman, is the legitimate inheritance of the farmer, and will sooner or later fall into his hands. Such lands are not suited for range purposes, for the reason that whenever the natural rainfall is sufficient and frequent enough to produce a grain crop, the grasses remain green and full of sap until the frost kills them. With the coming of frost goes all the nutriment of grasses not matured, and the wood fibre remaining will not support animal life. Thus, the simple fact that any given region affords a cured and nutritious grass for winter feeding is proof positive that it is not adapted to agriculture, and that the ordinary farmer would only fail if he attempted to live by the plow. "There are millions of acres of this arid region," the report went on to say, "only suited for grazing fields, and in future legislation touching the public domain, the leading idea to be kept in view is this one question of properly separating the arid regions from the agricultural With rare exceptions, the talk about herd-owners 'bulldozing' and driving out would-be settlers and farmers is pure fiction. For the reason above set forth, the farmer who would attempt to settle and make a farm on any cattle range in the arid regions would be deemed a lunatic by well-informed persons. With more light on Western range subjects, and especially more information as to the character of the land occupied by the roving herds, a wonderful change would come over the minds of the Eastern people. There is really no antagonism between the grazing and farming interests of the West, because there cannot be, according to the nature of the country, any conflict. Nature has drawn the line of demarkation, and until that same Nature overrides her laws there can be none."

Experience in the Southwest had shown that under proper management, with careful breeding and plenty of water, from ninety to ninety-five per cent of calves could be raised. There was less tendency to put on flesh in this district than in the more Northern country. The grasses, while abundant and of sufficient nutritive qualities to build muscle and bone, and give the animals a round and shapely outline, did not possess sufficient sugar and starch to lay on flesh rapidly. On the great open plains, breeding cattle was not found so profitable. The average calf crop for a series of years had scarcely reached fifty per cent., and so long as cattle drifted as they did this percentage could hardly be increased. Cattle fattened very rapidly in the Northern country. Shrewd operators of the North had for years been buying young Southern steers, and placing them on their ranges to mature and prepare for Eastern markets. Experience had proved that a two-year-old Texas steer would gain two hundred pounds in weight when double-wintered on a Montana range than if left on its native plains.

A very large percentage of the cattle on the Northern ranges had been graded up from Texas cows. In 1881 there was a large drive from Oregon and Washington Territory, and since that time a good many young cattle and some cows had been shipped in from Iowa, Minnesota, Missouri and a few other States. These "pilgrim" cattle from the East have not shown as ready an adaptation to the range life as the Western and Texas imports, and the tendency was rather to discourage the traffic in them. "Raised on the pitchfork, so to speak," says Mr. Taylor, "they know nothing of self-dependence, and when the winter storm strikes them they naturally look for man's help and fail to 'rustle' for themselves. On the contrary, the Western and Southern cattle for generations have had to make their own provisions for winter, and they are always found hunting for something to eat. But the Southern cattle are light in weight, and as increased weight means profits, Northern ranchmen have for years been buying high-grade bulls from the East and grading up their herds. The native cattle to-day, on most Northern ranges, are as good, or perhaps a little better, than half-breeds. Shorthorns and Herefords are, as a rule, the improved breeds used, and our three and four-year-old steers weigh from eleven hundred to thirteen hundred pounds in the Chicago markets. This makes a very profitable animal when the markets are not broken by too large receipts; and the question is being generally discussed among ranchmen as to whether the herds are not sufficiently graded up to be safe and profitable. A few herd owners claim that a thoroughbred animal will sustain as much hardship and do as much 'rustling' for food as the scrub or grade.

"But the general opinion is that the 'rustling' qualities belong to the scrub, and that grading up means a larger carcass at the expense of the ability to endure the necessary hardships of our Northern winters. The practical point to determine is, how high can we grade up without losing the self-sustaining qualities? Large, well-shaped and weighty cattle are desirable, but if the mortality is increased beyond the gain in size, the improvement is a mistake. Sufficient experiment has not yet been made to definitely determine this point. Present information leads to the opinion that in time there will be established a fixed type of range cattle, something better than a half-breed shorthorn or Hereford, but developed by a blending of the best-suited beef brands. The Swiss cattle have been produced in this way, and they are a very good 'all-purpose animal.' No particular strain of blood can be traced in them, yet they are uniform in characteristics. Range animals, built up after a good model and uniform in size, containing all the improved blood consistent with a retention of the 'rustling' qualities, would have a tendency to create a more uniform market. At present the periodical breaks in the beef market are caused by sending in unripe animals, or those that are ill-shaped, in undue proportion. Uniformity in size and appearance will do much to maintain evenness in market values."

Diverting to the trail question, which had attracted so much attention at the Convention in the preceding year, Mr. H. M. Taylor said:

"I have received assurance from prominent Texas cattlemen that Texas will arrange within her own territory for a right of way to her northern border. This will give her cattle an outlet to the Neutral Strip belonging to the Government, situated between the Pan Handle of Texas and the States of Colorado and Kansas. As the Administration has taken strong and positive ground in favor of the right of way for Southern herds through the Indian Territory and Neutral Strip, it will be seen that an outlet for Southern cattle is at the present time secured to the southern line of Colorado and Kansas.

The quarantine regulations of the State of Colorado permit the admission within her borders of all cattle that may receive a bill of health from the State Sanitary Board. As this board has decided to admit all healthy cattle from Texas that have been driven all the way from their native ranges, the question as to a Northern outlet for Southern cattle is practically settled. In order, however, to avoid friction, and to accomplish the greatest good to the greatest number, with the least possible hardship, I would suggest that the Government withdraw from market the public land along and within the line of Eastern Colorado to the extent of a strip three miles wide, and extending from the southern line of Colorado to the Arkansas River, the distance being but seventy-five miles, and the amount of territory embraced being but two hundred and twenty-five sections, or one hundred and forty-four thousand acres."

When we reflect on the millions of acres that have been given outright to corporations, this request upon the part of so vast an interest as the great Western cattle industry, was, as Mr. Taylor argued, certainly modest and reasonable by comparison. The request appealed for favorable consideration on the further ground that title to the territory was not asked for, but the mere right of way during a short season of the year, in the interest of interstate commerce in healthy cattle for the benefit, not only of the stock growers, but the entire people of the United States. The drovers had already secured by the actual purchase of land in Colorado on both sides of the Arkansas River, at the eastern State line, a right of way over that stream. Mr. Taylor was assured by the gentlemen who had invested their money in this right of way that they would make it free to the owners of all healthy cattle who might desire to use it in moving their herds to Northern ranges. The cattlemen interested in moving their herds from Southern breeding grounds to Northern maturing ranges would cheerfully purchase, at full value, water privileges along this proposed route from individual owners, which would prevent any injustice being done. The Las Animas County (Colorado) Cattle Growers' Association, whose ranges lay adjoining the Neutral Strip on the south, and extended to the Kansas Line on the east, took action in the season of 1884 in favor of laying out a trail three miles wide along the east line of their county, which covered forty-four miles, or more than half the distance from the southern boundary of the State to the Arkansas River.

"I had a conference in Denver, Colo.," Mr. Taylor proceeds, "with quite a number of representative Colorado cattlemen, and also with members of the Executive Committee of the Colorado Cattle Growers' Association, and they assured me that they desired a trail laid out along the line stated. This is a matter of great importance to Colorado, for the reason that the country north of the Arkansas River is best adapted for the maturing of steers, of which thousands are annually purchased in the South to fill up the ranges depleted by the annual sale of beeves. The cattle industry of New Mexico, Arizona, Texas, and the Indian Territory will be greatly promoted by the maintenance of a right of way or trail over the route named, for the reason that the greatest profit to be realized from their investments in cattle depends on the success of the yearly movement of their young steers to the maturing ranges of the North; and the ranch owners of the North, who are finding their greatest profit in the maturing of Southern steers, are also interested in the success of this important matter. The price of beef is so largely dependent on the product of our Western ranges, that every man, woman and child in the United States is interested in fostering this great industry, and in seeing that all reasonable aid is extended to it by the General Government. The strip of country along the Colorado east line is devoid of settlements, and is in the arid regions, where farming cannot be successfully conducted without irrigation, and irrigation could not be employed at any point along this proposed line except where it is crossed by the Arkansas River, where right of way has already been secured. The grasses along this route are excellent in summer, and are much more abundant than the grasses near the mountains. As a winter range, this section is more dangerous than the ranges further west, because of the absence of shelter, and in consequence is practically unoccupied.

"The interests of the great breeding sections of Southern Colorado, New Mexico, Arizona and Texas are mutual, for the reason that prices of young cattle vary according to grade. Cattle from the Northern breeding sections are higher graded than those from the Southern districts, which enables equal profits to be made by purchasers of young steers from all sections at proportionate prices based on values, determined by grades. For these reasons there is no competition between the sections named,

and they unite in desiring measures that will prove of equal benefit to them all. The trail from the Southern Colorado line north would be a non-infected trail, on which native cattle from the non-infected districts could be moved with perfect safety. The Southern end of the trail in Texas would be dangerous, but cattle that have been moved from the infected region a sufficient time to purge themselves of the contents of their stomachs, free themselves from infection, and are no longer dangerous. The railroads having Southern connections in the non-infected districts would be largely benefited by the opening up of the trail indicated, for the reason that it is reasonable to presume that they would secure a satisfactory portion of the cattle seeking outlet North, which they would ship from Southern points and unload where the railroads crossed the line of trail. The Northern railroads interested in the movement of beeves to Eastern market would secure four times the present amount of business if the movement of young steers from Southern to Northern ranges was properly fostered. With the Northern ranges stocked with mixed herds of cattle, not over a sixteenth of the number will ever be marketed for beef within a given year, for the reason that mixed herds on the favored Southern ranges, where every cow is supposed to raise a calf, represents cows, calves, yearlings and two-year-olds in about equal numbers, and the offspring being equally divided as to sex, but one-eighth of the entire herd go to make up the yearly beef products. The increase on Northern ranges being one-half less, makes the available beef product but one-sixteenth of the mixed herd in each year."

In this connection it is interesting to point out that the cattle-drive from Texas, which was about four hundred thousand in 1880, fell off about a quarter of a million for the years 1881, 1882 and 1883. It rose again to over four hundred thousand in 1884, but fell off to three hundred and fifty thousand in 1885. Many arguments were adduced, based upon these figures, showing the absolute importance of the proposed trail. The "CHICAGO DROVERS' JOURNAL," in an issue published at about the time the report was prepared, mentioned a sale of a number of beeves from a Dakota range which averaged twelve hundred pounds each and which sold for sixty-two dollars and fifty cents per head. Deducting about seven dollars and fifty cents per head for feed and commissions, this left a net price of fifty-five dollars per head, twenty dollars per head more than the cattle would have netted if they had been matured on the Cimarron River in the Indian Territory where they were bred. These cattle were moved North under very auspicious circumstances, and the establishment of a trail as suggested would make this class of work much more satisfactory. Prices were depressed at this period, but smooth, fat beeves fetched high prices still, and millions of dollars were evidently being lost by reason of the marketing of unripe cattle, and by the need of a trail through Texas and the Southwest to Montana and the Northwest.

Turning from the trail question to railroad transportation, Mr. Taylor speaks of the great importance of improved accommodation. In the shipment of cattle by rail in the ordinary cars, he pointed out, serious injury was frequently inflicted upon the animals by the sudden stopping, starting and jolting. The new parlor cars, while very suitable for stall-fed fat cattle, did not answer well for the wild steers of the Western ranges. A great deal of the injury to cattle by rail could be avoided by judicious handling en route. The cattle were generally on the road for a number of days, and were wholly unable to obtain adequate rest from the start until they are finally unloaded. As a matter of course they could not rest in the cars, and when unloaded for feed and so-called rest, they were generally crowded into pens so closely as to make it impossible for them to lie down. "Range cattle," says the report, "must have room to lie down without coming in too close contact with each other, or they will remain on their feet, no matter how great their fatigue. Then the stops for feed and rest required by law are generally planned to take place during the day, a time when wild cattle are kept constantly disturbed by the strange sights and confusion constantly around them. If these stops for rest were arranged to take place in the quiet of the night, it would enable animals to get the desired and greatly needed rest. This plan would have the additional advantage of keeping the animals as cool as possible during transit in summer, for they would rest during the cool hours of the night, and in the heat of the day they would be kept cool by the current of air resulting from the motion of the cars.

"Too much importance cannot be attached to the matter of securing good, nutritious hay for feeding cattle in pens while resting, of which a full supply should be furnished. Shippers sometimes, from false motives of economy, do not half feed their cattle, and the hay which is frequently supplied

by the railroad and stock companies is of such poor quality as to be of little value for food. Stock yard companies should be required by law to supply the very best of hay, and furnish full feeds to all animals stopped off in their yards, whether the owner or shipper orders it or not. The limit of time that cattle are permitted to be run on cars without being unloaded for feed and water should be computed from the time the loading of the cars is commenced to the time when they are unloaded. Very often cattle are loaded on cars and then side-tracked and delayed, and are held in cars after stock yards are reached for a considerable time without being unloaded and fed. Heavy penalties should be enforced for violations of these greatly needed regulations.

"Cattle should, if possible, always be shipped in train-load lots, and special runs secured by which right of way is obtained in preference to trains carrying dead freight. With proper care in unloading

RANCH SCENE IN SOUTHWEST TEXAS.

cattle, avoiding crowding too many in a car, and proper attention on the part of the shippers in charge keeping the cattle on their feet while in the cars, and avoiding runs of over twenty-four to twenty-eight hours, with rests at night in roomy pens, with pure water and abundance of nutritious hay, cattle can be shipped from extreme Southern Texas to Northern ranges without any material loss."

So much attention having been given to Texas fever, it was only natural that a man of Mr. Taylor's observation should note that the United States had been greatly disturbed by the prevalence of another disease which not even the most severe critic of the Lone Star State could attribute to it. This was contagious pleuro-pneumonia, against which quarantine measures had been adopted. It was estimated by some that the State of Missouri alone suffered to the extent of one million dollars by reason of the depreciation of the values of cattle in her borders, on account of being practically shut off for a time in marketing her cattle, owing to the outbreak of pleuro-pneumonia in Callaway County. Radical measures were necessary, not only to stamp out what contagious disease exists among the herds in our country, but also to prevent the introduction of diseased animals from countries where infection prevails. We could never permanently free our country from the bane of contagious bovine diseases without shutting out all cattle from foreign countries where contagion exists. "Why should our Government," asks Mr. Taylor, with much force, "permit importations of cattle from foreign countries where contagious cattle diseases exist, when these countries, especially England, prohibits entirely the admission of cattle from the United States? 'It is a poor rule that will not work both ways.' 'An ounce of

prevention is worth a pound of cure,' and we can never hope to keep our herds permanently free from disease while cattle are admitted from countries where contagious cattle diseases were known to exist. If a single infected animal introduced into Australia caused a loss from pleuro-pneumonia of over forty-four million dollars, it will be seen that the responsibility which is placed on quarantine officials is too great to insure with certainty that no infected cattle will gain admission."

As Mr. Taylor argued in 1885, and what is equally true ten years later, there is too much money invested in the cattle industry of the United States to permit of any chances being taken. "I am aware," he says, "that I will incur the opposition of a class of live stock papers, largely subsidized by importers, in the radical stand I have taken in this matter, but I feel that my highest duty is to the cattle owners of the United States, and the interests of a few traders and subsidized newspapers sink into insignificance when compared with the other vast interests at stake. While I admit the advantage to be derived from the infusion of new blood into our herds, it is small as compared with risks attached to its introduction. I voice the views of the major portion of the prominent range cattlemen of the West in the views above expressed."

Another very interesting question arose in regard to prices. In some portions of the range country, it was pointed out, a mistaken notion had prevailed in regard to getting cheap Southern cattle. It was argued by some that if the price of young cattle in the South was depressed, the margin to the drover or the purchaser from the North, who went South to buy, would be increased by the amount of the depression in the South. Results had proved this a fallacy. The blockading of the drive the previous season, and the quarantine against Texas cattle from below the thirty-fourth parallel, caused a shrinkage of over five dollars a head on all classes of Texas cattle, but in sympathy with that decline values had gone off equally as much all along the line from Texas to Montana. And this would always be the rule. There was, and still is, a sympathetic connection between values of any article of traffic that is as certain and true as the magnetic needle. Commerce is Argus-eyed, and at once discovers the means of restoring any temporarily disturbing equilibrium in trade and values. The cattle industry of the whole country is interested in maintaining prices at all points. Temporary gains might be realized by remote sections, where the supply was inadequate to the demand, by, for the time being, disturbed values; but the reaction always comes, and when it does come it works permanent hardships. The true policy of Montana, Wyoming, Colorado, New Mexico, Texas, and other cattle countries, is to combine with each other, and, through compromise and comprehensive intelligence, work out a system of co-operation based on honor and justice.

It was evident, in 1885, that every year brought the interests of the ranchman and farmer nearer together, and that they were equally important factors of a necessary system. The steadily advancing value of farming lands necessarily made the life of a steer, from calfhood to maturity, a period of expense to the farmer, which materially reduced the profit when the animal was ready for the shambles. On the other hand, while the ranchman in the breeding sections bought a steer at the age of three years, at a comparative small expense, he had no facilities for obtaining that additional profit to be realized from the hardening process of feeding, and each acting independently was deprived of the advantage and profit that would be realized by operating together for mutual profit and benefit.

The range country east of the Rocky Mountains, Mr. Taylor pointed out, covers an area of open country two hundred to three hundred miles east and west, reaching from British America south to the Gulf of Mexico. Going south the trend of the mountains is to the west, and the plain country on the thirty-sixth parallel is not far from six hundred miles east and west. Over this wild expanse of almost treeless plains the cattle roam at will, and are frequently found hundreds of miles from their home range. Freedom of action is the insurance on their lives, for they walk in front of the blizzard until they find shelter or the storm abates. When spring comes a small herd is found scattered over an area of, perhaps, hundreds of miles. They must be gathered and the calves branded. To facilitate this work the round-ups were instituted, and the spring hunt for cattle meant an organized army of cowboys scouring the whole country. Mess-wagons were loaded with provisions, and a cook employed who drives the four mules or horses, and cooks for the ten or fifteen cowboys attached to the mess.

These boys were sent by ranchmen in ones and twos, with from half a dozen to twenty or more wagons, depending upon the number of cattle they represented. The men with three or four hundred

head of cattle found them as widely scattered as were the ten thousand of his neighbor. In order to gather his cattle he must have a representative with the outfits in the various directions the cattle drifted. This created an annual expense beyond the limits of the purse of the small holder, while to the owner of thousands of heads it was but a small per cent on the number of animals gathered. Thus the round-up system, while it was perfect in itself and enabled ranchmen to find all their strays, and return them to the home ranch, was too expensive for the owner of a few hundred cattle. It cost as much to run a bunch of five hundred cattle on an open range, and find all of them in the spring, as it did to run three thousand. And it cost virtually as much to run three thousand head as it did to handle ten thousand. Under these circumstances and conditions there was, ten years ago, a present and growing tendency among small operators to pool their issues and organize cattle companies out of their combined herds. By this means the annual expense per capita was reduced, in many instances, from three dollars to less than one dollar. The large companies were made up, as a rule, of combined capital from the East, taken in small blocks, and very frequently the funds so invested were widows' savings and orphans' legacies. Hence they appealed in strong terms to the public for the same kind and degree of protection that would be accorded to them if invested in any other class of business or securities.

Mr. S. H. Standart, another Inspector of the Bureau of Animal Industry, devoted several months of the year 1885 to a careful investigation of the condition of the live stock industry of Colorado and Territories of Dakota and Montana. In view of the great variation in estimates as to the number of cattle in those regions at the time, his report is of great value, and it is not by any means out of date. From the result of his investigations, it appears that at the close of the year 1884 the number of cattle and their value was as follows:

State or Territory.	Number of Cattle.	Estimated Value.
Colorado	1,224,310	$38,542,800
Dakota	484,312	13,500,000
Montana	826,648	24,700,000
Total	2,535,270	$76,742,800

Nine months later there had been a marked increase in the number of cattle, and the figures for Colorado, Wyoming, Montana and Utah were as follows:

State or Territory.	Number of Cattle.	Estimated Value.
Colorado	1,420,388	$42,611,640
Wyoming	1,515,763	55,743,823
Montana	1,200,426	42,014,910
Utah	445,000	12,237,500
Total	4,581,577	$152,607,873

In order to obtain the information desired, circulars were addressed to cattle traders and rangemen generally, and their replies very carefully tabulated. It was found that the breeds generally in use were Durhams and Herefords, and their cross with native Texans. In Colorado alone nearly fifty million acres, or seventy-five per cent of the area of the State, was devoted to pasturage, and in Montana seventy million acres, or about the same percentage, was similarly used. The annual increase in cattle in Colorado was found to be about twenty-five per cent, while in Dakota and Montana the increase was as high as forty per cent. Most of the cattle were shipped to Chicago and other markets when between the age of two and six years. The rates from Colorado averaged $7.89 per head to Chicago, the rate from Dakota being about six dollars. From the figures before him, Mr. Standart estimated that the cost of feeding an animal on the range in Colorado until fit for beef was about $8.40, or nearly twice the cost in Montana. In the former State the loss during the preceding winter from want of shelter was about four and a half per cent, and the loss of flesh during the winter from the same cause was estimated at about twelve per cent. In Dakota the loss from both causes was larger. The annual increase in cattle at this time was fully sixty per cent in Colorado, fifty-four per cent in Dakota, and eighty-four per cent in Montana, importations as well as natural increase being included in these averages.

The general condition of the cattle industry of Colorado at the time was found to be very good. It was even admitted that not a single case of Texas fever had been found in the State during the preceding twelve months, although there had been over a hundred thousand Texas cattle brought into and through the State during that period. In Wyoming the condition of affairs was equally satisfactory. During the preceding year this State had shipped to Chicago and Eastern markets one hundred and sixty-seven thousand beeves. These had been sent by rail in common stock cars at an average cost for freight of about $7.60 per head. The losses on the ranges in Wyoming from lack of shelter during the preceding winter had been very small, and those from Utah had been estimated at less than five per cent.

In Wyoming the losses on the range of native or acclimated stock for the preceding winter had not been up to the average. The losses on cattle brought into the Territory from other States and Territories (those from Texas are called "rawhides," and those from the Eastern States "pilgrims,") the previous winter had been very serious in some localities and moderate in other sections of the Territory, the losses depending largely on the condition of the cattle and the season of the year they were turned out on the range. The reports on the losses of "pilgrim" and "rawhide" cattle showed a wide difference, and vary from three to fifty per cent, the average being about twenty-one per cent. Taking the average of all reports on all classes of cattle for the winter of 1884-85, the loss was five and one-tenth per cent in the Territory.

In Wyoming there was no disease of a serious nature existing among cattle, owing to the "very efficient" quarantine laws existing, which were fully and timely promulgated by the Wyoming Stock Growers' Association, through its President, Hon. J. M. Carey, and its Secretary, Hon. Thomas Sturgis. The Territory had suffered no material loss from contagious diseases, and during the twenty years that cattle had ranged in that Territory, there had never existed any contagious or other serious malady. It had been the experience of the cattlemen of the Western and Northwestern States and Territories that there was no cattle disease, contagious or otherwise, indigenous to the country, and with proper quarantine laws enforced, the Western States and Territories could be absolutely protected from exotic or contagious diseases.

A further series of investigations as to the condition of the live stock industry west of the Mississippi River was made by Mr. Lawrence Wilson, also an Inspector of the Bureau of Animal Industry, and Mr. J. M. Bradley, one of his colleagues. From investigations made over an immense area, a vast amount of information was acquired, and the following table is reproduced because it is really the most practical summary of results in existence concerning a period of exceptional importance to the cattle trade of the country as well as to the West. The table was as follows:

States and Territories.	Number of Cattle.	Number of acres devoted to grazing.	Number of cattle devoted to dairy purposes.	Annual consumption.	Value of the cattle trade.	Cost of transportation to Chicago, per head.	Cost of transportation to St. Louis, per head.	Cost of transportation to Kansas City, per head
Arizona	188,973	68,655,460	15,118	14,680	$ 5,395,912	.....	.....	$7 85

The report as to Kansas is of value in many respects and covers a large area. Shorthorns, crossed with Texas and native cows, were found to be the most popular breeds, with Holsteins, Devons and Herefords following. Reports from correspondents gave the annual rate of increase from ten to ninety-five per cent. For the production of beef, shorthorns took the lead; then followed the Hereford breed, the Polled Angus and the Galloway. They were marketed at from two and one-half to three and one-half years of age. When sold at two and one-half years of age, they were usually purchased from ranchmen by parties who ripened them on corn and sold them at the age of three and one-half years. The animals were generally transported in common cattle cars to market. The cost of transportation was as follows: To Kansas City, two dollars and fifty cents; St. Louis, three dollars and fifty cents; Chicago, four dollars and fifty cents. It costs to raise a steer on grass and forage, from two dollars to eight dollars per annum; to grain-feed, from thirty-five dollars to forty-five dollars. The condition of cattle on ranches was generally good from the first of June to the first of January. If well fed and cared for they were usually in good flesh in the spring, but if not, they were very poor. On farms, they were protected in the winter season by barns and sheds, but on ranches they had but little protection or shelter of any kind. When sheltered and well-cared for, the loss was usually about five per cent. The preceding winter, where the stock was greatly exposed, the losses were twenty-five per cent. In some instances the losses exceeded fifty per cent.

The cattle fed for market in Iowa were found to be mostly grade shorthorns, and the most acceptable breeds for the dairy were Holsteins, Jerseys, shorthorns, and natives, in the order named. Correspondents give the annual rate of increase of cattle in the State at from ten to thirty per cent. The breed best adapted to beef production was the grade shorthorn. The animals were marketed at from two and one-half to four years of age. They were generally shipped to market centers by rail in ordinary stock cars. The cost of transportation to Chicago was from one dollar and fifty cents to five dollars per head. In this cost was generally included that for feed, yardage, and commission at point of destination. The condition of animals from May 1 to January 1 was generally very good. From January to May they were thin in flesh unless well sheltered, fed and watered. The average loss for want of shelter and proper attention was about two per cent. Great improvement could be made in the facilities for transportation of stock by railroads. Lower rates should be charged, and larger and better cars and faster time for stock trains should be afforded. Cattle were affected with but few diseases. A few cases of murrain and black-leg, and an occasional outbreak of Southern cattle fever, were about all that were mentioned. The losses from disease did not exceed one per cent.

In Nebraska, grade shorthorns appeared to be the most popular breed for rearing and fattening for the market. The most acceptable breeds for dairy purposes were Jerseys, shorthorns and Holsteins, preference being given in the order named. Correspondents variously estimated the annual increase in cattle, some rating it as low as ten per cent, while others believed the increase to be all the way from fifty up to ninety per cent. Shorthorn and Hereford grades were the breeds regarded as best adapted to meat production. They were usually marketed at the age of four years. Two-year-olds generally went into the hands of stockers, and were full-fed on corn for one or two winters. Cattle were carried to market in common stock cars. The cost of transportation was three dollars and fifty cents to Kansas City, four dollars and fifty cents to St. Louis, and five dollars and fifty cents to Chicago. It cost thirty-five dollars per head to grain-feed and fatten animals. The condition of cattle on farms and ranches was good from June 1 to January 1; the balance of the year, if not well fed and sheltered, they were usually in very thin condition. The character of shelter afforded them during the winter season included barns, sheds, walls, timber and thickets, banks, bluffs, etc. The annual loss from lack of shelter was five per cent.

Mr. Wilson concludes his observations with a singularly fair statement as to Texas fever, which must have been received with a considerable amount of surprise and annoyance by some of those learned people at Washington who, having established a theory, had been for years leaving no stone unturned in their effort to prove it by actual or imaginary figures. "I am glad," wrote Mr. Wilson in September, 1885, "to be able to state that there has not been, so far as I have been able to learn, an outbreak of Texas fever or any other contagious or infectious disease within the Territory assigned me, and that there is at present no immediate prospect of such a calamity befalling us. Thousands upon

thousands of Texas and other cattle have been removed from one point to another without causing or spreading any disease, a thing never before known, and since this movement has only been permitted under the supervision of laws, State and national, after strict sanitary and veterinary inspection, the public in general, and stockmen in particular, see and feel the benefits arising from the enactment of such laws and the enforcement of all necessary veterinary and sanitary regulations.

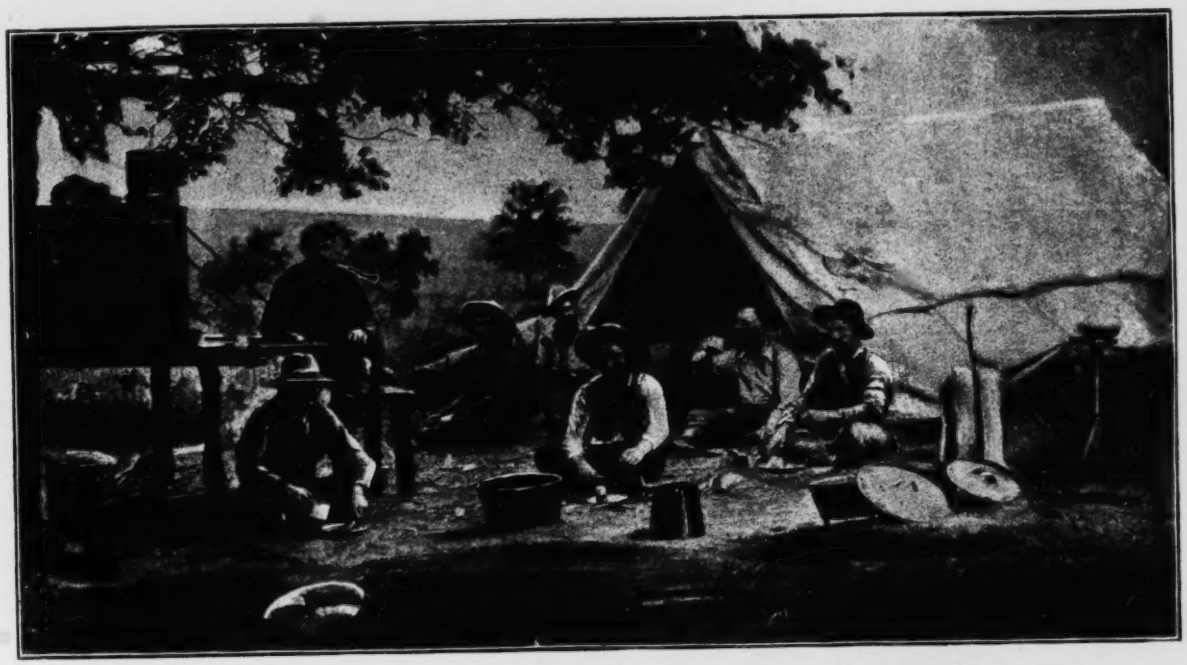
Mr. Wilson, it should be added, did not write as a Texan, his State and home both being in Kansas.

A great deal of information was unearthed by Mr. Colman and his agents with reference to States concerning which the cattleman is too apt to think very little, or, if he thinks at all, to underestimate their importance. Alabama, for instance, was carefully investigated by the report makers, and the fact that it offered many advantages to the stock growers was pointed out. "Of the lands within the border of the State a large proportion are uncultivated, and on these lands grow many varieties of grasses and forage plants capable of affording abundant sustenance to domesticated animals. Some of these grasses are scarcely surpassed by any others in value as food for cattle. Three large rivers and innumerable smaller streams furnish a copious supply of pure, clear water that never fails. The climate is mild and without those extremes of temperature that make stock growing often unpleasant and reduce the profits thereof in other regions. The domestic animals of Alabama have been quite generally exempt from epidemic diseases, and the outlay necessary for proper caring for cattle and other live stock in that State is very small; yet stock growing received comparatively little notice from owners of lands in Alabama until within a few years. Now, however, considerable interest is shown in the work of improving the quality of the live stock within the State. For that purpose a considerable number of purely-bred animals of great value have been taken to Alabama. Bulls of high breeding have been imported from the North to increase the value of the cattle, especial attention having been given to the work of improving the butter-making and milk-producing capacity of the stock. Jersey cattle have been imported in greater numbers than any other purely-bred animals. This work of improvement would, doubtless, have been carried on more rapidly had not the effects of the war retarded the movement, which is now going on at a constantly accelerating rate; and the cattle of this State will eventually rank as at least equal, if not superior, to those of any other State in the Union in value as butter producers, if not as beef producers."

Alabama has an abundance of grasses, the varieties totaling a hundred and fifty. About fifty of these are of considerable value for grazing purposes. It is claimed by the authority above quoted that an abundant supply of hay can be obtained in this State with less labor than can a large supply of any other product. The grasses that spring up spontaneously in wet places, and those which follow crops of small grain, afford a considerable quantity of hay of good quality; so good, indeed, that one correspondent declares that this hay is almost always better than that which is imported. "Several species of clover are found growing wild," he writes. "and furnish excellent pasturage all over the State; and the best varieties of red clover are very generally grown in the northern parts, constituting the staple forage crop of those regions."

In this State, so well favored for stock purposes, there were found in 1884 about two hundred and twenty-eight thousand milch cows and four hundred and eighty thousand working oxen and other cattle, showing a gain during the four years following the census of less than one per cent. A great increase in the number of working oxen was found, but it was also noted that while the number of working oxen had increased, the number of cattle had fallen off. In 1850, when the population of Alabama was seven hundred and seventy-one thousand, there were two hundred and twenty-seven thousand milch cows, and a total of seven hundred and twenty-eight thousand cattle. In 1860, when the population was nine hundred and sixty thousand, the number of cattle of all kinds reached seven hundred and seventy-three thousand. The effect of the war during the next ten years was clearly shown in the falling off in the number of cattle to less than half a million, and although there was a reaction from these low figures, those of 1860 had scarcely been reached at the time to which we are referring. Some cattle were found to be imported from Georgia for grazing, and the average cost per head was about $4.50 per year. Very little attempt had been made to feed cattle with corn, in spite of the immense quantities raised in the State, and cotton seed and cotton-seed meal were much more popular for the purpose.

Georgia, just after the great boom was over, was first in the number of oxen for the yoke, but far lower down in the list in the matter of range cattle. Two systems of stock raising were found to be used in that State, and the condition of affairs which prevails to-day was found to be very much the same ten years ago. In one system of feeding, stock are confined in enclosures and receive from their owners care, food and some shelter. This method is more generally adopted in the farming districts of upper and middle Georgia than in the southern part of the State. In the mountains, stock ranges at will over the hills, and in uncultivated valleys, as they do in the vast pine forests of lower Georgia. They find in wire grass or in Bermuda grass the greater part of their sustenance. The cost of keeping cattle in this manner is merely nominal, since owners of herds need buy little, if any, more land than will serve for a homestead on which to establish headquarters. Their stock roam at will over lands owned by non-residents, and their pasturage costs their owners almost absolutely nothing. Under conditions so favorable the profits of cattle raising would be considerable, even though the animals sold



MIDDAY MEAL.

at low figures. It will be seen that there is a resemblance between cattle growing in Georgia and the same business on the plains of the West. Cows are seldom, if ever, milked. Their calves are permitted to roam with their dams until the latter wean one crop, that another may take its place at the udder.

In Georgia, however, the stockman has an advantage in the fact that his cattle have ever at hand an abundant supply of water and are never exposed to severe storms. No "norther" can harm flocks or herds in the forests, nor among the sheltered valleys and timbered hills of the State. The forage of the open plains may be of better quality than the coarse native grasses of the Southeast, but it is usually found that the stock of Georgia is generally in as good condition as are those of the open plains where grass appears in early spring. In the Southeast cattle do not drift far from their native pastures, but remain content and undisturbed on the grounds to which they are accustomed. This saves their owners from losses of a kind which sometimes are heavy on the unfenced Western ranges.

For store stock to be fattened for beef Georgia depends now, as it did in 1885, almost entirely upon her own herds, but receives a few cattle from Alabama. Thus, those brought in are, as a rule, "scrubs," or unimproved native cattle. No very young stock is taken to Georgia from other States to be grazed and fattened for beef. Representatives of all the leading beef breeds are found in the State,

including Herefords taken in Clinch County and Galloways in Whitfield County. Georgia imports few, if any, calves, and but a very limited number of store cattle of any age; but calves dropped in that State are almost universally saved to grow to mature age. Even in the vicinity of larger towns there seems to be no such wholesale slaughtering of calves for veal as is seen in many parts of the Northern States. The greatest slaughter of calves occurs in the immediate vicinity of Atlanta, particulalry in De Kalb County, where fifty per cent, and in Fulton County, where thirty per cent, are thus used, and in Chatham County, in Southeastern Georgia, where fifty per cent are thus killed to supply Savannah. In many districts none are used for veal, and in no other counties than these named are more than twenty per cent used. The average cash value of calves slaughtered for veal ranged in 1885 from two to ten dollars in different parts of the State. Near Atlanta, they are worth, in early spring, from three to five dollars each, and near Savannah, about six dollars per head.

"For making beef, stock of all ages are used indiscriminately," says the report. "For grazing, of course, young animals are preferred, but cattle of three, four or more years are accepted. Most beeves are marketed when 'grass-fat,' whatever their age may be at the time. There seems to have been little or no effort to put stock generally on the market at an earlier age than that at which cattle were sold ten or fifteen years ago. This may be, in part, if not wholly, caused by the fact that the income from cattle is almost all profit, in the beef-grazing portions of the State particularly. It is well known that where little cost attends the production of domestic animals of any kind and the profits are large, their improvement advances slowly. Competition is a strong factor in progress in this as in all other branches of human industry, and there is practically scarcely any competition in beef growing in Georgia. When in marketable condition the beeves of this State weigh alive from eight hundred to fifteen hundred pounds. It may be that the greater weights mentioned are attained by working cattle that have been fattened, although there is little doubt that many of the animals at that weight are steers produced by using purely-bred bulls of a beef breed."

The great difficulty in the State, so far as the stock industry is concerned, has always been the matter of transportation. Thus, at the time to which we are referring, the cost per car load from Central Georgia to Chicago varied from two hundred and twenty dollars to two hundred and forty-five dollars, or about fifteen dollars per head. This left some margin for profit in heavy beasts, but not in others, and hence less attention was paid to the matter than would otherwise have been the case.

The figures and facts, collected as they were from over a large area, and by gentlemen who appeared to have been infused with the spirit which actuated Mr. Colman when at the head of the Agricultural Department, serve to correct, in a large measure, many of the erroneous impressions created by wild and enthusiastic statements as to the tremendous amount of business done during the boom years in cattle. They also serve as a summary of the condition of affairs at a time when the cattle trade was suspended, as it were, in the balance, and when many predicted an immediate falling off of profit and income, while others looked for an immense increase in both the extent of the trade and the money to be made out of it.

So far as Texas and the Southwest are particularly concerned, a great influence was exerted at this time by the enforced removal from the Indian Territory of immense herds of cattle, some of the stock being fat and ripe for marketing, but much of it being immature, and having to be placed on other grazing land, just when the area hitherto available for this purpose was being rapidly curtailed by settling up and fencing.

Cattle grazing in Oklahoma and the Cherokee Strip came to an end almost tragically. We have all read of how "Oklahoma Payne" came to grief again and again in his efforts to locate colonies in Oklahoma prior to its legal opening. It was always his idea, or at least his claim, that his efforts were checkmated by the cattlemen whom he charged in seusational terms with opposing the boom movement on the ground that if the country were settled up the cattle would be forced out. That he was absolutely wrong is now generally admitted. The cattlemen were allies rather than opponents of Payne and his daring followers. The loss involved to the latter by being driven out was trifling; the loss inflicted upon the former was enormous, running into the hundreds of thousands of dollars.

The Government action in this matter was scarcely consistent. Prior to the war slavery existed among the Cherokees, Choctaws, Creeks, Chickasaws and Seminoles. The Confederate States

occupied part of the Indian Territory at times, and recruited several regiments for the Confederate army. Owing to the sympathy of these tribes with the South, and their many overt acts to assist it, the Government held them to have forfeited their old treaty rights and compelled them to enter into new treaty obligations in 1866. By the terms of this treaty the Cherokees parted with a large body of land in the southeastern corner of Kansas, granted to them by the patent of 1838; assented to the rectification of the Kansas State line by pushing it southward about three miles, as previously stated; had their western boundary of absolute possession fixed at the ninety-sixth meridian, and agreed that all their lands lying west of ninety-six (which included the Cherokee Strip) might be taken by the United States to settle other tribes of friendly Indians upon, whenever needed for that purpose. The Government recognized the fact that all this land belonged in fee-simple to the Cherokees, by providing the machinery for its appraisal, and by subsequently taking and paying for all that part of it now within the boundaries of Kansas. In addition to this, when the Osages were induced to sell their Kansas lands and move to the Indian Territory, the Government took 1,400,000 acres of this Cherokee land lying west of the ninety-sixth meridian (as the treaty of 1866 authorized), and paid the Cherokees for it. Nor was this all. As if to forever settle this one point, the Government required the execution of a patent or deed thereof from the duly constituted authorities of the Cherokee Nation to the United States. So, again, in the cases of the Kaws, Poncas, Otes, Pawnees, Nez Perces and other friendly tribes, subsequently settled upon this Cherokee Strip, the Federal Government took it formally under the provisions of the treaty of 1866, and paid for the land so taken in each instance.

It will be seen that the United States has always recognized the absolute Cherokee ownership of this Strip. It is not an occupancy title, but the full fee. The treaty of 1866 merely gave to the Government the right to take such part of it as might be needed for the use of other friendly tribes whom it might be wished to locate there. Two other cases illustrate and prove the foregoing propositions. When the Government took this land for the use of friendly Indians, it did not comply with the treaty stipulations concerning its appraisement, as it was morally bound to do. The Cherokees objected to the price awarded them for it, and succeeded last year in securing an additional appropriation of three hundred thousand dollars on that account. Owing to most of the Strip lying so far from the seat of the Cherokee Government, and being entirely separated from them by the reservations cut off for the Osages and others, the Cherokees decided it was to their advantage to lease all the unoccupied portion of the Strip to the Cattle Association. The Government, although it subsequently tried to reflect somewhat upon the validity of this agreement, was perfectly aware of its existence, and, indeed, formally consented to its being signed. The rent was paid regularly every half year, and in the most open, business-like manner.

This being the case, the cattlemen were naturally indignant when, in the year 1884, the Government, as a result of the publicity given to the matter by the Payne agitation, commenced to treat them as trespassers, and to order them off the premises in anything but uncertain tones. In the year 1885 the matter became seriously aggravated, and was brought to a final and disastrous conclusion. General Sheridan, having been sent to the Territory for the purpose of investigating the causes of trouble, made a report in which he took the Indian's side of the case a good deal more than was expected. A delegation, including some of the best-known cattlemen interested in the Strip, waited on President Cleveland on August 4, 1885, and presented a memorial signed by the Cheyenne & Arrapahoe Cattle Co., Hunter & Evans, Standard Cattle Co., S. R. Moore, Seth Mabry, Newman Farr, S. M. Briggs, James Morrison, W. E. Mullalley, the Wood-Bagby Cattle Co., Underwood & Clark, E. Fenlon, Dickey Bros., the Wichita Cattle Co. and the Tower Cattle Co. The memorial they presented in behalf of the lessees of lands in the reservation covered the situation so accurately that it is best to reproduce it without alteration. It read:

"We do not doubt that it is the desire of the Government to deal equitably with this question in its relations to all parties, and those who have occupied the Territory by leases for two and one-half years, by the permission and authority of the Government, are entitled to a resonable period for the removal of their property. The leases, which were in every case made with the knowledge of the then Secretary of the Interior, were submitted to him and received from him every sanction, except the formal and technical affix of his signature and seal.

"Under these circumstances, the lessees of the lands in question have placed upon them a large number of cattle, estimated at not less than two hundred and fifty thousand. In addition to the value of the cattle, we call your attention to the further investment in range improvements, fencing, corrals and all the belongings of so extensive a business. The aggregate of value affected by the executive order may, therefore, be fairly stated roundly at over seven million dollars.

"The area of land affected by the proposed action is between three million eight hundred thousand and three million nine hundred thousand acres. This acreage being stocked to its grazing capacity by the number of animals stated, an equal amount of land is required for the subsistence of the animals elsewhere; and among the most serious of the questions suddenly forced upon us is: Where can this amount of land be found, all the adjacent territory being fully stocked? It cannot be found by driving the cattle back to Texas, whence many of them came, and the remote ranges of Wyoming, Montana and Dakota can alone provide for them.

"It is absolutely impossible to secure and locate lands in these Territories within the time allowed, and were it practicable to find lands supplied with water in these Territories not already occupied, it is impossible to gather the cattle scattered upon their present ranges, and move them north at this season of the year. Cattle cannot be driven in herds exceeding three thousand, and it requires twelve men and sixty horses to handle such a herd. It will, therefore, be seen that to move the entire number of cattle affected by the executive order, an aggregate force of one thousand men and five thousand horses must immediately be collected. This is utterly impossible at this season of the year, when range work is at its greatest activity and experienced herdmen fully employed. We have but few men at the present time, having our ranges enclosed by fence and not requiring herders.

"The drive from the ranges now occupied, to new ones in the Northern Territories, can not be made in less than from three to four months. In moving the cattle from their present locations subsistence must be found along the whole drive they traverse, and it is well known by cattlemen that at this advanced season of the year the summer heat has seriously impaired the nutritious qualities of the grasses. The result must necessarily be that many of the cattle would perish on the line of march, and those finally reaching the Northern ranges would be in such an enfeebled condition as to be unable to withstand the rigors of the Northern winters, to which they are unaccustomed. We desire to emphasize this statement by the further fact that the streams and water-holes along the trails are all lower at this season than at any other, and many of them are entirely dry. The distance required to be traveled by the cattle to these new ranges at the North is from eight to twelve hundred miles. The universal custom of those engaged in the business of driving cattle from the Indian Territory and Texas ranges northward is to start them in no case later than April. Experience has shown that cattle put upon the Northern ranges later than August 15 are so reduced by the long drives that they are unable to gain strength to endure the early winter storms.

"A large proportion of the cattle affected by this order have been brought into the Indian Territory this year from Texas. The quarantine laws of Kansas, Colorado and New Mexico rigidly forbid the admission of such cattle into, or their transit across, their territory prior to December 1. We respectfully refer you to the recent proclamation of the Governor of Kansas in this connection.

"The above are but a portion of the difficulties which confront us. There are other features of the subject which commend themselves to executive consideration, among which is the fact that rentals for all these lands have been paid to the 1st of November of the present year. No amount of diligence will enable us to gather up all the cattle during the time allowed, and the result must be that the uncollected portion will be left on the range unprotected by their owners, and subject to the depredation of the Indians.

"In conclusion, we respectfully state that this memorial is directed not against the policy which has been adopted, but against the time which has been allowed to conform thereto. We only solicit that measure of protection to our property which is accorded to other established interests. The enforcement of the present order can only result in great injury to ourselves, as well as to others with whom we have business relations. We, therefore, respectfully ask for such time to remove our cattle as the above facts show to be indispensable."

Col. Denman followed up the memorial with a very earnest speech, in which he pointed out that the cattlemen understood their business better than any one else could possibly do so. It had been stated that the President intended to insist upon all the cattle being removed within forty days, and he pointed out that it would be impossible to secure the requisite number of men and horses during that period to commence the work. He strongly urged that the cattlemen be allowed until the following spring to remove their cattle. President Cleveland's reply was exceedingly discouraging. He stated that it was impossible to delay the matter until the following spring. He urged the co-operation of the cattlemen, and told them that no modification could be hoped for in the matter.

The delegation turned back West in a very unsatisfactory frame of mind. Telegrams engaging cowboys were dispatched in every direction, and the men determined to get the cattle out as rapidly as possible. Fully two hundred and fifty thousand cattle were involved in the order, and at the time there were fully one and one-half million cattle in the entire Indian Territory, including the Cherokee Strip, The announcement was made that all leases would be canceled right away, and within a week a proclamation by the President confirmed the rumor, and showed that, important as was the industry at stake, no consideration whatever was to be shown to it.

It was not until six or seven years later that the Cherokee Strip was finally cleared of cattle, but the death-knell to the cattle interests, so far as the Indian Territory was concerned, was really sounded in July and August, 1885. It is significant that very little recrimination or hard feeling resulted from the action of the President and his Cabinet. It was generally felt that the Government had been misinformed as to facts, and had looked upon the matter in a somewhat narrow-minded way. But, colossal as the task of getting out and abandoning the blue grass of the Territory seemed, it was undertaken and completed. The loss to the country, as well as to the cattlemen, as a result, has been enormous, a fact which has since been recognized, though the injustice done was not, and, indeed, could not, be rectified.

COMPANY "D," TEXAS RANGERS

CHAPTER IX.

The Collapse in Prices, and the Causes Which Produced It.

AS WE have already remarked more than once, the history of the cattle industry of Texas and the Southwest, and, indeed, of the United States, is a history made up of cycles. We read in the Bible of Pharaoh's seven years of plenty followed by seven years of famine. Thanks to the invaluable advice given to the Egyptian monarch by a man—who may fairly be described as having been born and raised on a range, and to have been in his boyhood, even more picturesquely attired than the most excitable and enthusiastic cowboy of to-day—precautions were taken during the years of plenty, and when the term represented by the lean kine commenced, there was in store a large supply of food and feed for man and beast, not only for Egypt, but for other adjoining countries.

In the cattle trade the mysterious figure of the seven, with all its mythological inference, has not been so conspicuous. Sometimes the period of plenty has lasted less than a year, and the period of depression which followed has been equally short-lived. Sometimes it has been longer. But, as we have seen in earlier chapters, an absolute disregard of the laws of supply and demand has almost invariably broken down prosperity whenever it made itself apparent, and too often very little provision was made for the inevitable rainy day. It is now the duty of the historian to speak of the decline of the cattle industry and period of inflation of the early eighties. The writer of these chapters, having investigated the subject from an impartial standpoint, and having absolutely no interest in or partiality toward any one of the various theories adduced, is in a position to give both sides of every story.

While there is a great deal of controversy, and there will always be, as to who is to blame for the knifing of profits of recent years, and particularly between the years 1885 and 1890, there are some arguments of weight which are admitted by all. The first of these is that the business of cattle growing, or rather of cattle selling, was overdone. In this connection attempts have been made, as already noted, to make the mammoth Convention of 1884 a scape-goat for the trouble, and to blame it as having been the cause of the immense increase in the number of cattle shipped to market in advance of demand and requirements.

There really seems little justification for a charge of this kind. It was perfectly well known before the Convention was held that the cattle-raising industry was in an abnormally prosperous condition, and that as prices had nearly doubled, it was obvious that men who had made money at the old figures must have nearly coined it at the new. The only point one can see in the charge brought against the mammoth Convention is that it attracted press notices from all parts of the country, as well as in all the leading cities of the Old World, and hence may have contributed in a measure toward the excessive introduction of capital and amateurs into the business, and to the raising and marketing of all kind of cattle regardless of age, weight, grade, supply and demand.

No reflection can possibly be cast upon the officers of that magnificent gathering of cattlemen, or of the association which it organized and started. For a time that association bid fair to carry out work of a most important character, and we believe that the good it accomplished far more than outbalances any possible injury that may have resulted from the publicity it caused and the attention it attracted. It should also be borne in mind that the association which was the outgrowth of the first National Convention of Cattlemen was not by any means the only national society of its kind. The Convention of Stockmen at Chicago had started another association, and for a time the woods were full of national and international organizations which were designed to protect the interests of members, and to uplift and uphold the cattle trade in its various phases, and especially those which appeared most important to the individual organizers and promoters.

There was no limit to the scope or location of these associations or to the conventions they called. The first National Convention of Cattlemen at St. Louis was followed by a second convention of

similar name, while the Chicago stockmen held three conventions, one after the other, at dates calculated to almost clash with those of the St. Louis organization. Then, while these two associations, with headquarters at the two Western cities, which for a quarter of a century have been antagonistic to each other in many respects, were practically opposing each other, although nominally working in harmony, the International Range Association was formed, and a grand Convention held in Denver, Colo., in January, 1886, or within two months of the second St. Louis and the third Chicago Conventions. All over the country, State and local associations held meetings, at which they endorsed first one and then the other of these associations and conventions, and the man who tried to follow the transactions of the various bodies and keep himself posted on the policy outlined, adopted or condemned, found his head swimming, and had to ask himself more than once, in common with the defeated politician: "Where am I at?"

One by one the national associations gave up the ghost without an effort. Most of them collapsed by mutual consent. In other words, when the organizations were found to have outlived their usefulness, to have lost the enthusiastic support of their members and to have failed in the objects for which they were specially organized, the officers were wise enough in their day and generation to quit calling meetings, and to allow the societies to lapse on general principles.

Just how many of these associations survive to-day we are unable to state. Out of more than fifty letters of inquiry sent to the last-known officers of the associations scarcely any have produced definite replies, and many cattlemen have stated that the Texas associations, described more fully in the last chapter of this work, are the only ones with any great influence to-day. This may be incorrect, but, if it is, the fault for the existence of the impression rests with those who have made no effort to correct it.

That the prosperity of the cattle trade has declined in consequence of the collapse of so many associations is by no means assured; but it is certain that the two events were coincident, no matter which was the cause and which the effect. The magnificent prices, to which we have alluded as making glad the heart of the cattleman in the early eighties, were succeeded by prices which, while, in some instances, they left a nominal margin of profit, took away the gold-mine appearance and reputation of the trade, and made the earning of a livelihood much more common than the amassing of a fortune. What may be termed the non-controversial cause of the collapse of the boom while it was at its height, was very similar to the causes which led to the collapse of less remarkable periods of prosperity ten and fifteen years previously. In other words, undue haste to become rich and to find the road to wealth led to the killing of the goose to secure the golden egg, which it was apparently willing to lay at respectable intervals.

The expression "Cattle King" or "Cattle Baron" is not a popular one on the ranch or at the stock yard. The term grew into existence, or rather prominence, at the time of which we are speaking, or the first few years of the eighties. Newspapers on the lookout for sensational items printed accounts of the phenomenal wealth and prosperity of the so-called cattle barons and cattle kings, and any one from Texas, Colorado, New Mexico, Arizona or Wyoming, who happened to be located at a hotel in an Eastern town, by a reporter on the lookout for a news item was generally described as "that well-known cattle king, Mr. ——," no matter whether the gentleman was a cowboy, a country postmaster, or a small storekeeper. The name got to be used so freely, and with such little regard to fact or reason, that it soon became a by-word on the Southwestern, and more particularly the Western, prairie, and when a man was asked to purchase something at a figure which appeared somewhat high or beyond his reach, he would often reply, with ill-concealed sarcasm, "I'm no cattle king."

We have yet to find a cattleman to the manner born and thoroughly experienced in all the happenings, dangers and difficulties of ranch life, who calls himself a cattle king or cattle baron, or who tolerates the term as applied to himself. We have met several so-called cattle kings, both in Eastern cities of America and in cities of the Old World. On their way out to take possession of their kingdoms, these self-styled kings or barons were so overstocked with enthusiasm, that if there had been a market for such a commodity, it would have been overstocked and the demand would have been supplied a thousand times over every day. On paper, their fortunes were ready-made or doubled or

trebled, as the case might be. They expressed themselves on every subject with that freedom so characteristic of a man who knows nothing of which he is talking.

Hoyt, in his play, "A Texas Steer," lampoons the Texan a little too severely, although, at the same time, he shows up many noble characteristics of the native of the Lone Star State. He tells, with his delightful sarcasm and humor, of a certain section of Texas which needed nothing but a little water and a little society to make it excessively desirable, but which was at the time absolutely worthless, and which, being located in the meanest part of the Staked Plains, was not inaptly likened by the newly-elected Congressman to that warm, but undesirable, country to which the bad man who dies in his boots is supposed to go. Attempts, such as Mr. Hoyt not improperly holds up to ridicule, were made again and again at this time to occupy barren tracts of land for alleged cattle raising purposes. Many millions were lost, not in cattle raising, but in fake schemes got up by professional speculators, and by men who had purchased worthless tracts of land with a view to selling them to misguided individuals, who had caught the Texas fever and were determined to stand in with the crowd which was supposed to be making thousands of dollars every hour by breeding and raising cattle in that much-talked-of, and at this time exceedingly popular, State.

It is not to be wondered at, under these conditions, there was a wild rush into the range country on the part of people inexperienced in the cattle business, but anxious to participate in the profits said to be so easily made by cattle raising there. A London (England) newspaper, published in the year 1883, explained, with great care and apparent accuracy, how a yearling could be purchased in Texas for three or four dollars, fattened at the expense of another dollar, and then sold at about sixty or seventy dollars per head net. In order to demonstrate the truth of these remarkable figures, the London journal pointed out that so rich were the pastures of Texas that an ordinary steer of three years weighed twelve hundred or fifteen hundred pounds, and that this meant a thousand pounds of dead meat. Beef, the paper proceeded to point out with mighty eloquence, sold at as high as thirty cents and thirty-five cents a pound in London, and even making allowance for cost of transportation, it was easy to understand that the figures it had quoted as to the net prices per head were under, rather than over, the mark. The article concluded with the interesting statement that the figures had been furnished by a cattle king—whose name was carefully withheld—who, himself, had realized an enormous fortune by raising cattle and disposing of them in the manner described.

Idiotic as these figures and arguments were, they were quite common in what may be described as tenderfoot sections; and that they were really believed and relied upon, is evident from the tremendous rush of inexperienced men into the West and Southwest, all determined to obtain their share of the profits to be realized from buying yearlings at half or a third current prices, raising them at a third or fourth the actual cost, and then selling them at figures about double the ordinary quotations for two and three year olds raised in the manner described.

In the opinion of the most conservative members of the trade, these were the men who broke down the prosperity of the cattle industry of the West and Southwest.

They brought with them ridiculous ideas as to the cattle business. Political economists and theorists generally have, for many years, been explaining that the agricultural depression in the Old World is not so much the result of a falling off in demand, of increased cost of production, of foreign competition, or even of lower markets, as of the change in the mode of living of the farmer himself. A generation or two ago, these writers have pointed out, again and again, the European farmer was himself a worker, taking his turn at the plow or sickle with his men, and getting every cent that was possible out of his small holding. In more recent years the tenant farmer has become more ambitious for himself and his family. He expects to take part in sports and recreation hitherto restricted to the landlord and the squire. His daughters, instead of attending the village schools, and commencing to help in the kitchen and dairy, almost as soon as they could read and write are sent to boarding and finishing schools, and dressed without regard to expense. The sons are taught from infancy to regard farming as an unfortunate occupation, and are, in consequence, only too glad to go to college and study for some already-overstocked profession.

As a matter of course, the little old farm house, which had answered all requirements for the preceding generation, is regarded as entirely too shabby and old-fashioned for the highly educated

young people, and money is, accordingly, borrowed for the erection of either additions or of new houses. The old horse, which had carried the family to the nearest town on market days and to church on Sundays, has to be replaced with a more expensive animal, and a first-class carriage is substituted for the spring van which formerly did duty both for business and pleasure. In a variety of ways, the agricultural theorists explain, the expenditure of the small farmer in Europe has about trebled in a generation. At the same time, or during the same period, profits have been curtailed and, as a result, debts accumulated, and an era of discontent pervades the agricultural regions of England and Europe.

We have introduced this fragment of Old World history and philosophy because it is strictly pertinent to the subject we are now discussing. The young men with swelled heads and limited intelligence who crossed the Atlantic twelve or thirteen years ago in order to locate on ranches, make fortunes in a few months, and return home to live lives of luxury and ease from that time forth, represented the extravagant agricultural idea to perfection. The Texas cattleman seldom goes in for extravagance or luxury on the ranch, no matter how wealthy he may be. Solid comfort he naturally aspires to, but he has not yet discovered how to combine pleasure with business every day, and how to enjoy all city luxuries on the broad and open prairie.

But the young men to whom we are referring thought that it was the ignorance, rather than the good sense, of the cattlemen which prevented them from launching out into extravagance and having a royal good time. Many of the new-comers were descended from leading families of the Old World, and these, in particular, introduced the aristocratic ideas of farming into Texas, Arizona, Wyoming and other cattle countries. Dressed in costly velvets, with buckskin leggings and patent-leather boots, these exquisites considered it beneath them to count the cost too closely. They made a certain class of trade good for a time by buying whatever suited their fancy at the moment, and paying almost any price demanded, on the theory that it was beneath them to bargain or haggle. Again and again they neglected their business for the purpose of engaging in hunts and exploring expeditions. Some of them kept expensive packs of hounds, stables with blood horses, and gave receptions and parties at frequent intervals. For actual life on the prairie and the work connected with legitimate cattle raising they had a supreme contempt and dislike, which they took every opportunity of expressing. Sometimes they were so aggravating in their remarks as to provoke hot retorts, and occasionally unpleasantness resulted which was always attributed to the ill-breeding and bad manners of the original inhabitants.

These men committed acts of folly by the thousand. They purchased more ground, in many instances, than they could possibly use; and the amount of fencing they had done, while it must have been very gratifying to barbed-wire dealers, was a source of immense inconvenience to smaller and more sensible cattlemen, who were not seeking the entire earth, but were satisfied with fair profits and a good living. Their extravagance was so wanton that it was merely a matter of time how soon their capital would be exhausted, or how soon supplies would be cut off from the old country.

Ruin stared the wiseacres in the face from the outset. In some instances it was delayed a short time by more or less favorable circumstances which came to the rescue of the exquisites. But the day of reckoning was seldom long postponed, and when it came disaster followed. Few people felt any great sympathy for the invaders, whose regard for the feelings of others had generally been conspicuously small. But the trade generally suffered almost beyond computation from the sudden throwing upon the market of cattle of all ages and conditions, which, in many cases, were consigned without the least forethought or pre-arrangement, glutting the market and cutting prices all to pieces.

It is the opinion of many well-qualified judges that the high prices, to which we have referred several times, could have been very nearly maintained but for the fact of such an immense quantity of unsuitable stock being forced on the market. Be that as it may, it is certain that the self-styled cattle king or cattle baron, with his extravagant notions and foolish ideas, expedited disaster and brought about a whirlwind which, while it annihilated him, seriously injured the men he affected to despise, and who he had tried in vain to educate up to his own erratic and quixotic ideas.

Mr. James H. Campbell, a careful student of the cattle business, expresses himself in a very conservative manner on this subject. Without actually endorsing every one of his arguments, we repro-

duce them as a most important contribution to a controversy which has been in progress for eight or ten years, and which has formed the basis of a most important Congressional inquiry. "Various theories," says Mr. Campbell, "have been advanced, among them that the dressed-beef interest and purchasers of cattle had combined to break prices, and that a few of the larger packers were responsible, in a measure, for the shrinkage in values that has been going on the last few years. But the writer desires to give a few plain, practical reasons for the fluctuations in the value of cattle for the past decade or so, other than those suggested above, and hopes to make himself understood, as he believes his reasons are based on actualities rather than theories. So many disappointments have been suffered, so many fortunes made and lost, that the subject has become a very serious one, and worthy of earnest and honest thought. Experience is a hard schoolmaster, but a practical one, and it may be that our review may prove valuable to the general trade.

"In the years preceding the advent of the great industry called the dressed-beef business, or from the close of the war in 1865 to the year 1876, the prices of cattle were governed entirely by the supply and demand.* We had practically none but a home market. Raisers and producers took their cattle to market and met buyers from the East, who purchased their stock on its merits; always, of course, basing their values upon the supply, present and prospective, as well as the consumptive requirements of the people. But between the years 1876 and 1880 a great revolution in the cattle industry commenced in the United States. Some enterprising Eastern Yankees began slaughtering cattle in Western markets, and shipping only the carcasses to the East and to the seaboard, instead of following the old system of shipping only live stock. It was also discovered that improvements in shipping and carriage facilities were such that either live or dressed beef could be sent across the Atlantic Ocean, to various Old World markets, at a profit to the shipper, thus opening up a new field for our product.

"It required but a very few months for the latter feature to develop into a prominent factor in the cattle trade. First, live cattle were exported, then dressed; then both live and dressed beef, meeting with ready sale, developed another interest—the canned-beef industry, by which millions of pounds of beef are annually shipped to almost every point in the civilized world. The opening up of this export business in the ways mentioned developed an enormous demand for fat steers suitable for the export trade, and really worked a revolution in the cattle business, especially as the trade with other countries was quite remunerative. Naturally enough, the strong demand for good cattle stimulated production, as well as enhanced prices of the raw material, and this continued until we over-produced.

"From 1878 to 1882 the revolution was rapid. Capitalists saw a good opening for investment, and for 1878–79 there were large purchases of breeders made all through the great corn belt, and these were shipped to the far Western States and Territories, where millions of acres of land were available, almost without cost, for feeding purposes. The outcome of this was the development of the ranch idea. Bulls, heifers and cows were actively sought for breeding purposes, and then began an era of production rarely if ever equaled. The 'cowboy' became an actuality instead of an idealist. Everybody that could was anxious to become interested in a ranch. Texas, the Indian Territory, Wyoming, Arizona, New Mexico, Colorado, Nebraska, Dakota and Montana all vied with each other for supremacy in the cattle-producing and cattle-raising industry. The short corn crop of 1881 and the favorable winter of 1881–82, which made feeding on the wild Western lands available, materially aided these Western producers, so that in the spring of 1882 cattle all through the Western States and Territories were in good condition. Native cattle were not plenty, owing largely to the drain of the two or three years preceding of breeders by the Western ranchmen, so that the spring of 1882 witnessed an urgent demand, at prices rarely before reached in the history of the trade—viz., nine cents per pound gross. When it is remembered that cattle shrink from fifty to fifty-five per cent in killing, it will be readily seen that the above price (nine cents) really meant seventeen to eighteen cents for the real meat of the animal. This does not mean for the choice cuts, but for everything, the soup-bone as well as the porter-house steak.

"Now, let us see what the consequence of these high prices were. We have shown what caused the enhanced figures up to and including the year 1882, which, it may be remarked, was a phenomenal

*Self-evident as this assertion of Mr. Campbell appears to be, it is not altogether correct, as the figures already published show. Prices have sometimes fallen with a shortage in supply, and risen when shipments were very heavy.

year in the history of the cattle trade. A great many men and much capital were brought into the business prior to 1882. But the high prices of this (1882) year—which enabled ranchmen and feeders to net handsome profits—developed still greater investment inquiry on the part of capitalists. There was, and had been for some time, not only a liberal, but a rapidly growing, demand for beef cattle, and not only American, but European capital as well, anxiously sought investment in cattle raising. So rapid, indeed, was the growth of this business, and so large the profits, that the pioneer cattle raisers and producers who had been content to go out on the frontier and risk their lives as well as their capital, with only a prospect of moderate returns, and most of them possessed comparatively small herds, suddenly awoke in the spring of 1882 to the fact that their herds were veritable gold mines. Cows and calves had advanced in a comparatively short space of time from eight to ten dollars a head to thirty and thirty-five dollars per head, while youngsters, yearlings and two-year-olds had advanced almost three hundred per cent in three years."

Mr. Campbell proceeds to show that, stimulated by the high prices prevailing, the Mississippi Valley and the great corn belt of the West was virtually "skimmed" of cows and heifers by speculators and ranchmen who wanted them for breeding purposes. A very large number of bulls that, under ordinary circumstances, would have been sent to market as beef steers, were preserved and shipped to these Western ranges. All these features were not without effect on our supply of native cattle. In point of fact, as noted above, a vast territory, reaching from the British possessions on the north to the Gulf of Mexico on the south and the Pacific Ocean on the west—a territory which had been previously largely inhabited by no other humans than Indians, and by buffalo and other wild animals, had almost, as if by magic, been transformed into great breeding and grazing grounds. And what was the result of this? Simply that the business was overdone, and the end was what invariably follows overproduction.

Not that the result was developed in a month or a year, for it was not. Had it not been, however, for the opening up of new markets for the product—had not exporters of cattle utilized refrigerators on cars and on vessels, and had not packers discovered the utility of packing beef in cans so that it could be shipped to almost any clime, then it is more than likely the rebound would have set in before it did.

The fact is—and it must be apparent to every thoughtful man—that this overproduction exerted a deleterious effect on the stock itself. Prior to this great influx of breeders, the boundless prairies were as free as air. Cattle roamed wherever they chose. But wealthy corporations purchased or leased large areas, introduced barb-wire fences, and the roaming area was diminished. The result of this was a largely reduced grazing area, and the feed was eaten clear to the ground, so that now, instead of raising such cattle as we did ten years ago, we are producing half-starved, ill-shaped beasts, that do not carry flesh or make weights as beef steers, even when fully matured. Is it any wonder, when all the above facts are considered—overproduction and inferior quality especially—that the cattle trade is not in a healthy or prosperous condition?

Mr. William Kuykendall, in another of his letters to the "TEXAS STOCKMAN AND FARMER," argues in a very similar and equally forcible strain. It is not a matter for surprise, he points out, that during a period of universal excitement, caused by abnormally high prices and an apparently insatiable demand, the ranchmen should have disregarded the law of conservatism, and invested to a greater extent in both cattle and lands than prudence would have dictated. The result of this mistaken policy has made many land-poor. Had the inflated price for cattle then ruling continued, the end might have justified the means, but in this boom, as in all others, history was destined to repeat itself. At an unprecedented rate herds were multiplying throughout the country. Notwithstanding the increasing demand, both at home and abroad, for our meat products, the demand was not keeping pace with the rapid increase of supply. The inevitable crisis came in 1883, when a sharp decline in the market for all classes of cattle was noted. The markets failing to rally under the increased burdens, serious disaster to the country followed.

Conditions had arisen that brought the producers into contact with problems not hitherto encountered; a new factor, the cost of production, for the first time became an important part of the trade question. Heretofore, under the "free grass" regime, the cost of production was merely

nominal, but under the new system the investment in land and fences had greatly enhanced the cost. Nor was this the only new condition which had arisen to aggravate the situation. The rapid settlement of the country closed the "trails," the great thoroughfares over which hundreds of thousands of cattle were yearly driven at a cheap rate to the maturing ranges of the West.

Besides these, evils of greater or less importance were beginning to exercise their influence. The pastures were becoming overstocked, obligations contracted in the purchase of lands and stock were beginning to mature, and the Western States were enacting quarantine laws to protect their herds against the introduction of splenic, or so-called Texas fever. In the face of these discouraging circumstances a feeling of panic pervaded the business, and the disposition to get out of it was only equaled by the desire to get into it a few years before. Many disposed of their interests at great sacrifice and abandoned the business. The extensive packeries at Chicago, St. Louis and Kansas City, which, by turn, have been blessed and cursed by ranchmen, were taxed to their utmost facilities to utilize the vast numbers of inferior grades of cattle thrown upon these great central markets.

"Here, it may be remarked, parenthetically," Mr. Kuykendall concludes, "that the salutary influence exerted over our cattle trade by these great modern industries has been incalculable; for, be it remembered, that largely the greater portion of our Texas beef has for years past found the only available market at these establishments, and, in the absence of the demand thus created, a market for the poorer grades of cattle could not have been found elsewhere. Through these channels, during the past ten years, a vast amount of the product of our herds has reached foreign markets, which otherwise must necessarily have been thrown upon our domestic markets, already greatly depressed, thereby forcing a further decline. In this connection it should be borne in mind that we produce on our Texas ranges no beef suitable for the export trade in live cattle, and it is only through the dressed meat or canned goods trade that we are enabled to reach foreign consumers."

The evidence taken by the select Committee of the United States Senate on the transportation and sale of meat products, during the years 1888 and 1889, contains the opinions of a large number of well-known cattlemen concerning the depression in the trade, which is the subject matter of this chapter. Of the report prepared by the Committee as the result of its inquiry we shall speak later, but, at the present time, our object is to place arguments as well as conclusions before the interested public. It needs not a philosopher to show that the best way to emerge from a period of depression is to inquire closely and carefully into the causes and circumstances which produced that depression. Hence, too much space can scarcely be given to a compilation of opinions as to the cause of the rapid fall of prices of range and other cattle after the boom.

The select Committee consisted of Senator Vest of Missouri, Senator Plumb of Kansas, Senator Manderson of Nebraska, Senator Coke of Texas, and Senator Cullom of Illinois, the latter being relieved at the close of the Fiftieth Congress by Senator Farwell, of the same State. The inquiry was held as the result of the action of the United States Senate in May, 1888, when it was resolved that a special Committee of five Senators should be appointed by the President of the Senate, whose duty it should be "to examine fully all questions touching the meat product of the United States; and, especially, as to the transportation of beef and beef cattle, and the sale of the same in the cattle markets, stock yards and cities; and whether there exists or has existed any combination of any kind, either on the part of the Trunk Line Association or the Central Traffic Association, or other agencies of transportation, or on the part of those engaged in buying or shipping meat products, by reason of which the prices of beef and beef cattle have been so controlled or affected as to diminish the price paid the producer, without lessening the cost of meat to the consumer. That said Committee may hold its sessions during the recess of the Senate at such times and places as it may determine, and shall have power to send for persons and papers, and also to employ a stenographer and a sergeant-at-arms; all necessary expenses of said Committee to be paid out of the contingent fund of the Senate; and said Committee shall make report to the Senate at its next session by bill or otherwise."

This resolution was passed at the request of Senator Vest, who, in his speech, advanced a number of theories as to the causes of the depression, which he proved by an immense number of figures and statistics. Most of these figures, while exceedingly interesting, were almost overwhelming in their extent, but the following table of average weights, prices, charges and net values of cattle, from States and Territories named at Chicago in 1887, is of sufficient importance to justify its reproduction in full:

MISSOURI.

	Per Head.
Assuming same weights and divisions as Iowa. Average weight, 1,200 to 1,400, estimated to comprise one-sixth of the shipments.	
Average price, $4 40	$57 20
Less charges	3 35
Net value	$53 85
Average weight, 1,000 to 1,100, estimated to comprise two-thirds of the shipments.	
Average price, $4 00	$42 00
Less charges	3 35
Net value	$38 65
Average weight, 700 to 900, estimated to comprise one-sixth of the shipments.	
Average price, $2 00	$16 00
Less charges	3 35
Net value	$12 65
General average, weight and price	$40 20

CHARGES—

Railroad freight	$2 50
Yard charges	25
Feed charges	10
Commission	50
Total charges	$3 35

ILLINOIS.

	Per Head.
Average weight, 1,300 to 1,500, estimated to comprise one-sixth of the shipments to Chicago.	
Average price, $4 60	$64 40
Less charges	2 32
Net value	$62 08
Average weight, 1,100 to 1,200, estimated to comprise two-thirds of the shipments.	
Average price, $4 00	$46 00
Less charges	2 32
Net value	$43 68
Average weight, 700 to 900, estimated to comprise one-sixth of the shipments.	
Average price, $2 00	$16 00
Less charges	2 32
Net value	$13 68
Average of all combined	$44 06⅔

CHARGES—

Railroad freight	$1 50
Yard charges	25
Feed charges	07½
Commission	50
Total charges	$2 32½

COLORADO.

	Per Head.
Weight at Chicago, pounds	1,050
Price per 100 pounds in Chicago	$ 2 65
Gross value, 1,050 at $2 65	27 82
CHARGES—	
Railroad freight	$4 50
Yard charges	25
Feed charges	50
Commission	35
	5 60
Net value	$22 22

WYOMING.

Weight at Chicago, pounds	1,100
Price per 100 pounds at Chicago	$ 2 75
Gross value, 1,100 at $2 75	30 25
CHARGES—	
Railroad freight	$4 50
Yard charges	25

Net value	$27 05

Dealing with the relative importance of the three great Western cattle markets, and the influences which had been, and were still, at work in connection with these, Mr. Vest said: "I dislike, in the discussion of a great question like this—for it is a great question—to say anything that has the least appearance of local interest, but I am compelled to allude to the fact that the largest city in the State, the City of St. Louis; which ought, geographically, to have been at least the equal of Chicago in the sale of and purchase and shipment of cattle, is to-day far behind Chicago, and so inferior to it in this matter of purchasing and shipping cattle that a comparison is hardly worthy of being instituted between the two cities. St. Louis is the great city of the Mississippi Valley, and geographically it ought to be the shipping point for Texas, the Indian Territory, and the large ranges of the Southwest, but for some reason, which I now propose to investigate, the cattle interest of St. Louis has been stricken down.

"The city in which I live, Kansas City, is to-day in close alliance, so far as the cattle interest is concerned, with Chicago; but Chicago is the heart, blood, brain, liver, of the cattle trade throughout this country and throughout the world. As great as that city is, and no one admires its prosperity, enterprise and activity more than myself, it has not been natural reasons that have brought this about. It has been a combination, a selfish combination of interests, as a matter of trade and commerce, which, now that it has affected the price of cattle to the consumer, becomes a matter of the greatest importance to every man who thinks it is his duty, as an American citizen or legislator, to investigate the present condition of affairs. We know that to-day five firms in the City of Chicago control the price of beef throughout the whole United States. There is not a butcher in the City of Washington who is not subservient to that combination in Chicago; not one from Boston to Charleston, but who feels the effect of this combination. The great railroads of the country running into Chicago are in the interest of this combination. They are in sympathy with these five firms, and to-day any bunch of cattle that goes from any portion of the West, and all go to Chicago, the moment they are shipped these gentlemen at Chicago are apprised of the quality, the number, when they will arrive, and are prepared with a price. The prices are fixed every week. I said on a former occasion every day; but they are fixed practically so that every morning the price is agreed upon between the purchasers, and the shippers who bring cattle to that market must take those prices, or let the cattle die, or ship them back to the place from which they were brought."

Senator Cullom, speaking to the resolution, entered what was practically a plea of guilty on the part of the combine. "This is not the result," he said, "of a year or two's operations; it is the result of the operations of certain forces which have been going on for many years. The control of the live stock business of the United States is centered in the hands of a few men. Of course, this grows by what it feeds on. As these men have accumulated wealth, they have been able to go more completely into the markets of the entire world, and, by combinations and by operations with which we are familiar enough, to break down the small dealers, and therefore to break down, from to time, every single shadow of competition.

"They not only combine, as has been said here, in fixing the price of cattle that they buy in the market, but they combine to fix the price at which the cattle shall be sold in the State in which they put them on the market; and they do that by parceling out the territory among themselves, one great

dealer taking one section of the country, another another, and so on, upon an agreement that there shall be no competition by any of his fellows within the territory thus allotted to him. Thus it is, while they buy at the lowest price that is ruinous to the cattle producer, they sell at a high price to the cattle consumer; and so it has happened that they have actually put in their own pockets every single penny of the profit on every steer sold in Chicago during the past five years or more, and as cattle have gone down their profits have been increased by just that much.

"Something has been said about the foreign trade. Undoubtedly that has been interrupted from the cause stated, but not interrupted to any extent which makes up the difference between the diminution in number of the cattle of the country, as compared with the increase of population compared with, say, ten or five years ago. The foreign trade in cattle has been controlled in the City of New York, in combination with operators in the city of Chicago, not upon the basis of the foreign demand, but upon the basis of the maintenance of a certain price for the home supply."

The first witness called before the committee was Mr. Dudley H. Snyder, the well-known cattle drover, residing at Georgetown, Tex. He explained to the Committee that his business was rather that of a cattle drover and shipper than that of cattle raiser, although he had raised cattle very extensively. In answer to the question as to the present condition of the cattle market, as far as the sale of cattle on the hoof was concerned, he said: "We commenced driving in 1868. The first cattle—that is, Texas cattle—we bought at one dollar and fifty cents to two dollars a head for one-year-olds; two-year-olds, from two to three dollars; cows and three-year-olds, about four dollars, and, I think, we bought our beef cattle at seven dollars. We took nothing over four years old, and nothing under yearlings. In those days we had to have a limit else we would get them heavier than we wanted to. For a number of years following the beginning of dressed beef we paid, in buying young steer cattle, a higher price for one and two year old steers than for like ages of heifers, from the fact that they were worth more. In 1871, I think, the drive of stock cattle commenced heavier from Texas. It is my recollection that six hundred thousand or six hundred and fifty thousand cattle were driven from Texas that year, the larger part being stock cattle. Then our prices began to advance steadily up to about 1880 and 1881, when they got up pretty high, it being the policy of breeders there, and, I think, it must have prevailed all over the United States, to take better care of the cattle and hold on to them as cattle grew higher in price. Hence, for a few years, along from 1881 to 1885, heifers would cost more than steers of like ages.

"I mention this to carry out my ideas of the business. I think the policy prevailed throughout the country of taking care of the heifer cattle, which, in a few years, gave us an immense supply of cattle. During those years, too, while cattle were going up to such high and fabulous prices, as I thought then, and think yet, a great deal of money was sent out from the East and from Europe to invest in cattle; and, in numbers of cases, cattle were bought at very high prices and at book account by men who did not know what they were doing, they representing large capitalists and syndicates. Therefore, I claim that in many instances where Texas cattle were bought at twenty dollars, they paid forty dollars on the book account. The same thing held good in Wyoming Territory, where we had a range also, the price there being about thirty dollars for stock cattle. I am sure, plenty of sales were made there where cattle were sold at thirty dollars a head, and on book account they cost sixty dollars or more.

As to the local conditions of the cattle industry, he said, as to Williamson County, where he resided: "It was simply an open country; hardly any farming was done in it. All the country northwest of me was an open country; it was unoccupied. Where the cattle are now covering the bulk of the ranges of Texas, there was then the buffalo. A few years ago I thought the cattle were certainly gone out of my county. I live right there, and I made it convenient to examine the Assessor's list for the country around me. I found that last year we ranged over fifty-four thousand head of cattle in my own county. That is a settled county. It has more cattle than it had when it was a cattle country, and when the northwest part of Texas was unoccupied. Now that country has been occupied, and the Territories have been occupied, and all the best ranges for cattle have been pretty much taken up, and yet the interior has not stopped producing cattle."

In reply to the question by Senator Manderson, Mr. Snyder said that the territory adapted for producing cattle was growing less all the time. The northwest part of Texas, and also the west, was

about taken up, and the necessity of shipping lighter and younger cattle than would otherwise have been the case was the result. The depression, he explained, had been very great in stock cattle, and in the lighter class of cattle they had been sold close, and there had been such immense shipments. Range steers, averaging from twelve hundred to fifteen hundred pounds, were as high this season as they were five or six years ago, but they were fewer in number.

Mr. A. P. Bush, Jr., President of the Texas Cattle Raisers' Association, was the next witness. He stated that he purchased his ranch in 1882, and moved on to it in the following year. The trade had been depressed and uprofitable for the last three years, due, he believed, to a combination of causes and to no one particular cause. One of these was the unlimited credit extended to the cattlemen, resulting in enormous liabilities being accumulated. These had to be realized out of the cattle, and this forced a large number on the market. The cattle thus forced on the market had not been, prior to that time, considered salable for beef. Hence, in his opinion, the main cause of the depression in the price of beef cattle had been a depression in the character of the cattle, and heavy shipments to market. He did not consider that there had been an overproduction, and the information brought to his notice did not bear out that idea.

An interesting feature of Mr. Bush's evidence was his statement that he was one of those who was attracted to Texas by the singular advertising the industry had received, and the exaggerated reports of prosperity to which we have alluded in the preceding chapter. Speaking of the unlimited credit to cattlemen which had affected prices, he said: "When cattle from abroad and capital from the East was attracted to the cattle business, then range cattle first began to be advertised as a great business, and began to attract the people. It had never done so before. It attracted me and I got into it. Not only people from the East, but people in Texas, and people in the Territory and people in the Northwest, bought and sold and traded cattle, paying what money they had, expecting prices to remain as they were and to be able to realize on the cattle, as the beef output then indicated, and as they would have done if the cattle had always been on hand that were sold."

The preceding year had been, he knew, a year of very large shipments, the largest Texas cattle raisers had ever had. "The stock of cattle to come from the Northwest," Mr. Bush went on to say, "we knew was somewhat depleted from losses. The stock of marketable cattle, steer cattle, to come from Texas we knew was depleted, because a large number of young cattle had been driven North, or had been lost, and a large number had been disposed of in various ways. The statistics will show that there were not the steer cattle in sight to market so as to equal the receipts of the season before. When this great increase in receipts began to come, it was not in steer cattle, but it has been largely in cows and cattle of that character, of all ages. There was an unprecedented number of calves and an unprecedented number of cows, born native and range; and there were instances where parties trying to get out of the business shipped their entire stock, all kinds and classes and characters, regardless of what they were. That is a class of cattle and a quantity of cattle that I did not anticipate, and I think many others did not anticipate that they would go into market to the extent that they did."

The next witness before the Committee was called under process, and was requested to enlighten the Committee as to the method in which cattle were being sold on the Chicago market. In reply to a request from the Chairman, he handed in the following list of current classifications and prices:

Northern Range steers	$ 2 65	to	$ 4 20
Texas steers	2 25	"	3 25
Texas cows	1 50	"	2 35
Veal calves	2 50	"	5 60
Milkers, per head	20 00	"	50 00

The prices, he explained, were those of November 20, 1888. He admitted that the Chicago market fixed the prices of later cattle that were packed, canned and dressed, when killed. As to the very heavy cattle, averaging sixteen hundred pounds and over, the prices in New York generally fixed the quotations in Chicago, because such cattle were shipped largely to New York, Boston, Philadelphia and Baltimore for consumption. The tendency to the concentration of receipts largely at one point had been to lower prices, and doubtless if the receipts could be scattered, it would help the sellers.

Referring to the sharp advance in prices of the preceding May and June, he attributed it to the appointment of the Committee, and was especially of that opinion because it was unusual for cattle to advance in price in the extremely hot weather, owing to the natural reduction of the consumption of beef. The more recent dropping down of the price was largely the result of an immense increase from the Northwest. There had been an immense amount of shipping from Montana during the fall, and the reduction in prices had not caused any great surprise to men in the business.

Mr. J. C. Beatty, of El Paso, Tex., was the next witness. He explained that about the year 1882 he moved from California to Texas, and was engaged in the business of raising, buying and selling cattle. Referring to the attempt made to establish a permanent refrigerator establishment in El Paso, he said: "We ran that plant for about six months, slaughtering just the beef cattle necessary for our own consumption in the town and the adjoining country there, as it was in the summer months. We furnished a very excellent article of beef four or five days old, something that we never had been able to get there before; the weather being so hot, we had to slaughter in the morning and eat for breakfast ordinarily. Our manager, Mr. Zeke Newman, went to California about a year ago, and made contracts in Los Angeles with local retail butchers, and also in San Diego and other towns north of those places, but in Southern California, to furnish them with so much meat per week during the winter. He came back and commenced slaughtering about fifty head per day. He continued the business for nearly two months. It made a nice market for the cattlemen in that part of the country, giving us about two and a quarter cents a pound for our steers right at our door. His own men took them off our hands on our ranches, and drove them to the town. He continued the business until the railroad company refused to give him cars to ship his beef to Los Angeles and San Diego. Mr. Newman had to cease slaughtering, and the refrigerator plant has been shut down from that day until the present time, except for the purpose of furnishing ice to the town.

"We had a nice market, shipping our beeves to California, to different points from Southern Arizona and Southern New Mexico. We were obtaining for these cattle, delivered in the stock pens at the different points of shipping, from two and one half to three cents a pound on foot, which we considered an excellent price. The Head and Hearst ranches sold nearly twelve hundred head at three cents. Along about the first of February Mr. Armour concluded that that business could not continue; that it was detrimental to his interests. This is the general understanding. Anyway, he shipped his beef in refrigerator cars to Los Angeles and San Diego, and there put it upon the market at a price at which we could not possibly compete without cattle going in on foot, and he broke the market for our cattle from three cents to one and one-half cents and one and three-quarter cents a pound; and it was done in less than ten days' time.

"The market was really a very healthy one for cattlemen. The butchers were all making money. I know they were very eager to get those cattle, and went down as far east as Brownwood, in Brown County, Tex., to gather up beeves during the winter months. This was in addition to the supply which we could put in the refrigerator, which did not affect the market. Only about fifty beeves a day could be put in the refrigerator. That did not affect the regular market, for we had a good market for beef. But the moment Mr. Armour put in his refrigerator beef, we were compelled to turn around and ship our steers to Kansas City, and sell them at a loss; and the same beef, I suppose, was sent back in refrigerator cars a distance of eighteen hundred miles to Los Angeles and San Diego."

The tenor of this witness's testimony was that the power of the beef combine, or the Big Four, had, by crushing out the El Paso industry, kept down the prices, wholly bringing about the unfortunate condition of affairs which had existed. He was followed by Mr. Brewster Cameron, who explained that he had been engaged in the growing of cattle upon the open ranges in Arizona for nearly six years. The cattle business was very much depressed, resulting, as he believed, from the absence of competitive markets. The Chicago markets controlled the principal markets of the country, with the single exception of those of California. "When the rangemen," said Mr. Cameron, "ship their cattle into the markets of Chicago, Kansas City or St. Louis, they are taken charge of by commission men. The producer has practically nothing whatever to do with the sale of those cattle. In fact, the buyers, as a rule, pay no attention to him. After they are turned over to the commission merchants, the producer has really no more to do with their sale than any one of the many hundred people who come there

every day, out of mere curiosity, to walk around on the fences and look in the pens where the cattle are. The cattle are disposed of chiefly to what is known as the Dressed Beef Trust. The butchers of the country, the feeders and all other buyers, with the exception, possibly, of the feeders who purchase in Chicago, do not have a free opportunity to buy in competition with the Big Four. The complaint of the rangemen in the country is not that the price of the range cattle is now too low; their complaint is that they do not have a competitive market.

"If, as the Beef Trust declares, there is an overproduction of cattle in this country, which, however, the producers deny, that will regulate itself under natural conditions under the laws of trade, if the beef combine is broken. All the producers want, therefore, is a competitive market. There are many producers of cattle now who are on the verge of bankruptcy, and are almost irretrievably ruined, who, several years ago, could have easily saved themselves, and who would undoubtedly have done so if they had believed at that time that the cattle business was governed by the laws of supply and demand, because they then would have known instantly that there was an overproduction, and they would have sold out at the prices they could have gotten at the time. But believing then, as they now believe, that prices are arbitrarily controlled by these men, for reasons which I will state later on, and that such prices are entirely artificial, they held on to their property in the hope that the time would soon come when this combine could not regulate the prices of cattle throughout the country, when they would be able to realize something out of their property. To particularize, as to my experience and information, I will state the following facts: I only made one shipment of cattle to Kansas City. I had an experience then which was very short, but which nearly every rangeman can testify to on a much larger scale, who has been shipping regularly to the Kansas City, St. Louis or Chicago markets. I brought there five hundred and seventy-eight head of cattle, if I remember correctly. They were divided off, as commission men divide them, into lots, so as to enable them to sell to the best advantage.

"As this was the first shipment I had ever made, I was, of course, entirely unfamiliar with the business. I stood around the pens and heard a great deal of discussion about the cattle. I heard a number of individuals, jobbers and feeders, express a desire to buy a part of them. I communicated this information, in a general way, to the commission men. They told me that it was better to sell them all in one bunch. I supposed it was myself, and they were accordingly sold, a portion of them for three dollars and sixty cents per hundred weight, which was a very good price for these times. I wished to thoroughly test the market, it being the first shipment made by me; therefore I had shipped various grades of cattle. They were all separated off according to grades. There was a great proportion of them in one grade. For that lot of cattle I was offered three dollars and twenty-five cents the first day. I thought they were worth more than that, and I held on to them. I got one offer after another, each a little lower than the former offer, until they came down to two dollars and fifty cents. Poorer cattle than those sold for higher prices between the time my first offer was made to me and the time when the offer was made which I was obliged to accept."

Mr. Cameron went on to describe at length the efforts he made subsequently to dispose of cattle directly in the East, and he condemned the Dressed Beef Trust and the Big Four in very emphatic terms, declaring that both butchers and cattle raisers were suffering terribly as a result of the operations of the combine.

Mr. C. C. Slaughter, of Dallas, who explained that he had been engaged in the cattle-raising business, gave testimony of the greatest importance as bearing upon the causes of the depression in the cattle-growing industry. Formerly he had disposed of a great many cattle at Pittsburg, New York and Buffalo, but in the last few years he had sold all his cattle in Kansas City, St. Louis or Chicago, and more especially the last named. He attributed the depression in the industry to the combination which existed. "I base my opinion," he said, "upon the fact that St. Louis was at one time a market in which I sold the principal number of my beef cattle. I am going back now to show how I made up my mind. St. Louis, as I say, was at one time a cattle market. I sold cattle there in 1882 for the highest price I ever sold in my life. I sold cattle that I raised on my ranch in Texas at the enormous sum of seven dollars a hundred. We think now that that is an enormous sum. They were

three-year-old cattle that weighed one thousand and eighty pounds, and never had eaten a bite of corn or anything except grass, to my knowledge. I sold them at seven dollars per hundred pounds in St. Louis.

"That was in 1882. At that time there were quite a number of establishments in St. Louis canning and packing cattle. Soon after that I found that those establishments were weakening; that they were not killing as many cattle as they had formerly killed. I found that if my cattle were sold here they went to Chicago. Naturally, I wanted to go to the head of the market, and I began to go to Chicago. I then began to ship cattle, as I had formerly done, though not a great deal before, to Kansas City, never considering that it was anything of an extra market. I drifted my cattle from Texas to the Indian Territory to graze, naturally throwing them farther west, and if I shipped to Chicago I took the nearest route and went by Kansas City.

"I found that if I offered my cattle at Kansas City for sale, and did not sell them, as soon as I would go to Chicago, before the cattle arrived, it would be known what I was offered at Kansas City, and it naturally brought me to thinking this is a strange coincidence; these fellows tell me just what I was offered at Kansas City, and they come up and just about offer me enough more to pay the freight, sometimes not so much. Then I would try St. Louis, and I found that about the same thing was going on there; that if I did not sell in St. Louis, and if I went on the passenger train to Chicago ahead of my cattle, the next morning, before their arrival, I would find that the offer was known that was made for them in St. Louis."

Several cattlemen, residing in Missouri and adjoining States, gave evidence of a similar character, and the majority of the witnesses were disposed to lay a considerable amount of blame upon the Big Four, and the absence of competition between different markets. These were followed by Mr. A. W. Willard, who admitted that he was a typical American, with a ready hand for everything, having been in the cattle business for eighteen years, as well as the grocery and banking business. The cattle industry of Texas was in a very depressed condition, and, so far as West Texas was concerned, the causes of the depression were obvious. In 1881 and 1882 the prices of cattle went up to a very high figure. Money from all over the Western States, and from England and Scotland, and other places, sought investment in the range country. That stimulated the raising of cattle in many places. The range became overcrowded. Since that time there had been in the range country unprecedented droughts. In the last three years in Texas the drought was unprecedented there. Lands had been bought in large bodies in West Texas that were open ranges, and they had been fenced up. Cattle had decreased in price. He could not see that there had been overproduction, though, for two years, a small percentage of cattle failed to get very fat. The dressed-beef business had had a bad effect on range-cattle prices, and he was one of the sufferers from the closing down of the refrigerator at El Paso, in which Col. Beatty and others were interested.

Mr. Jefferson Reynolds, of Las Vegas, New Mexico, was asked as to the condition of the cattle raising and shipping business, in which he was engaged. "The depressed condition in the prices that we receive for our steers was always a great surprise to us," he explained, "when we would hear from the East that the price of beef to the consumer was not declining in proportion. In order to verify that, when I was in New York I called at the different hotels, and I asked permission to examine the bills that they paid for meat in the last three or four years. Uniformly, they all agreed that they were paying the same prices now that they paid three years ago, and sometimes a little higher. I was also at Hartford, Conn., and I went to the hotels and butcher shops there and inquired about the prices they were paying now as compared with three years ago, and they told me they were paying higher prices in Hartford, Conn., now than they were paying three years ago. I explained to them that we were not getting within fifty per cent of the former price for our steers; and I asked the Hartford men why they did not come to the West, to New Mexico, and buy trains of cattle and avail themselves of the very low price of cattle in that Territory. They told me that they were afraid to do so; that the Chicago combination, which they represented to me as being Armour, Swift, Fowler and Morris, would establish retail markets in every city in New England, and would run them out of the business if they attempted to come into our markets and buy."

Speaking of prices, Mr. Reynolds said that he had been in business about seven years. During the first two years his steers brought him from twenty-seven dollars to thirty-five dollars a head. For

the following years the average was barely seventeen dollars, and since that time, or during the preceding years, he had been getting eleven dollars to thirteen dollars a head.

Mr. Ashley C. Halliwell, of the "DROVERS' JOURNAL," was called to give information with references to prices of cattle, and especially of those from Texas and the Indian Territory, during the preceding eleven years. He submitted the following tables, which contain information of great value, especially as bearing upon the question of prices as affected by production or overproduction:

EXTREME TOP PRICES FOR NORTHWESTERN RANGERS AND TEXAS AND INDIAN CATTLE, DESIGNATED "RANGERS," AND "TEXANS," RESPECTIVELY.

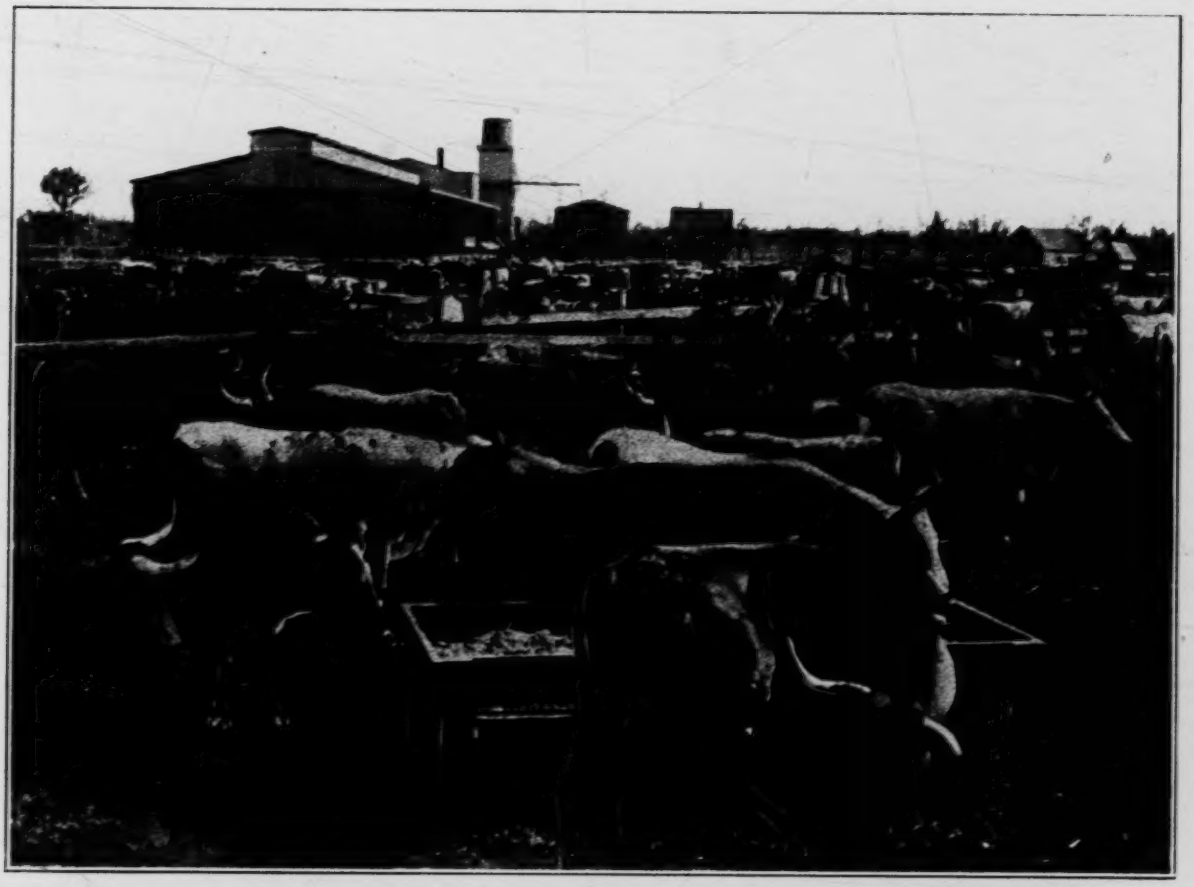
The first six months of each year represent "fed" cattle, and the last six months mainly show prices for "grassers."

He also made an important statement as to the receipts month by month of Texas cattle and rangers during the preceding seven years. The highest receipts in Texas were in 1887, when, according to his figures, 485,528 steers were received at the Chicago market. The smallest receipts for any year were for 1881, when the total was only one hundred and forty-eight thousand. The years 1883 and 1885 both showed reduced receipts, and the shipments for 1884 were all far the largest for any year with the exception of 1887. There had been far less variation in the receipts of rangers, which had varied from 176,680 in 1883, to 261,275 in 1887.

Mr. John Rector, an old resident of Austin, Tex., who had been in the cattle trade about four years at the time the investigation was made, was next called. He agreed with the preceding witnesses



COTTON SEED FEEDING PENS AT BROWNWOOD, TEXAS

as to the depression in the trade, and attributed to the encroachment of agricultural interests upon cattle interests proper the falling off in profits. He knew that a great many cattle raisers were shipping cows in order to reduce their stock, the present low prices not being profitable. It was the custom to ship cows to market when they got fat and old, but he thought there were other objects now for the shipping. The railroads had not reduced the charges of transportation on account of the low prices of cattle, and he thought that it was unnecessary to look much further than the undue proportions of charges to prices for the cause of the depression.

Mr. L. C. Baldwin was called as an expert stock raiser. He stated that he had been in the business ten or eleven years in Iowa and Wyoming, and for twenty years farther east. There had been a decline in the prices he had received during the last two years of nearly forty per cent. He blamed the manipulation of the markets, rather than overproduction, for the falling off in prices. He was satisfied

that from 1865 to 1880 there had been a gradual but slight increase in the ratio of cattle to population. Since 1885 it was obvious, however, that there had been a marked decrease. He based his calculations on facts brought before his notice, and especially upon the immense number of calves and cows that were being sold for slaughter. In addition to this, men were going out of the cattle business because it was unremunerative, and hence the stock on several ranches had been forced on the market.

Asked how he could reconcile the falling in prices with the falling off in the number of cattle raised and fed, the witness said it appeared to be due to combinations between the existing markets. Communication was frequent and rapid between Omaha, Kansas City and Chicago, and the man who refused the price at one of the smaller markets and went on to Chicago, was punished for his temerity. So far as he could see, there had been very little reduction in the price of meat to retailers in consequence of the heavy falling off in prices for cattle on the hoof. He thought, however, that the inferior and cheaper portions of the beasts were retailed at a less figure.

No evidence taken by the committee attracted more universal interest than that given by Mr. Philip D. Armour, who has been described both as the archfiend of combinations, and as the prince of benefactors and trade improvers. It was the great object of the great millionaire to show by his testimony, which he gave with much reluctance, that the decline in the prosperity of the cattlemen, while it had kept pace in adverse ratio with a phenomenal increase in his own prosperity, was not the result of it. In other words, the burden of his argument was that the two events had no connection with each other, and, indeed, that but for his enterprise there would have been still more cause for complaint and lamentation.

"In my opinion," said the millionaire, "the leading cause of the decline in cattle values is the overproduction and over-marketing of cattle. The over-marketing of cattle has been brought about by the reckless investments and speculations in ranch properties, which placed a fictitious value upon cattle and resulted, eventually, in the withdrawal of money so invested, thus compelling many engaged in the business to prematurely market their cattle to realize on them. Other causes have contributed to bring about the depreciation in the values of cattle: The low price of hides, caused largely by the immense free importation of foreign hides; national and State legislation against oleomargarine, which not only taxed the article, but, by reason of restrictive and prohibitory features of such legislation, largely decreased its manufacture; quarantine laws and regulations, which have discredited at home and abroad the healthfulness of our cattle and beef products, and has been seized upon by foreign countries as an excuse for attempted prohibitory legislation and for agitating, through the press and otherwise, their exclusion from foreign markets. The competition which has grown up within two or three years in the vast cattle-raising regions of South America, Australia and New Zealand has also aided to depress the price of range cattle, and all the products from these cattle. These causes have also aided to depress the price of what is known as native cattle; that is to say, cattle from such States as Illinois, Iowa, Kansas, Missouri and Nebraska. The depreciation in such cattle, however, has not been so marked.

"The farmers and breeders of cattle on high-priced lands of these States have been forced into competition with growers of cattle on the cheap lands of the West and Southwest. In many cases they have been forced to raise and feed their cattle on their high-priced lands with expensive feed and care, and put them in the market with cattle raised on the public domain, which are only grass-fed and receive little or no care. The extension of railways in all directions into the range countries, and the improved methods of transporting cattle, have brought the grazing grounds and the great cattle markets so close together in time that the feeders and raisers of cattle in the States have no longer the advantage which distance formerly gave them. The changes brought about in the last fifteen years in cattle raising, not only in this country but elsewhere, have, of necessity, compelled a change in the manner of marketing and of preparing the products of cattle for consumption, as well as in the distribution and sale of such products. As an evidence of this, it is only necessary to call attention to the centralization of markets; to the changes in the equipment for the transportation of cattle for long distances; to the refrigerator car system, by which fresh beef can be transported for a long distance and ripen and improve during the transit; to the exportation of cattle, fresh beef and beef products to

ROUND UP OF THE FRYING PAN HERD. AMARILLO, TEXAS.

THE
LIBRARY

foreign countries, and to the transportation of fresh beef and mutton from Australia across the tropics, and the marketing of it in good condition in England.

"It is apparent, to understand and intelligently discuss the present conditions of raising and marketing cattle and the products of cattle, different rules must be applied than would have been in the same sort of an investigation fifteen years ago. To market the vast herds raised on what used to be called the plains of the West and Southwest, to slaughter the same and prepare every part of the animal for market in which the consumer buys in the thickly-populated parts of this country and in Europe, is a very different problem than when the raiser of cattle sent his drove on foot to a near market, where it was distributed among small buyers. To pay to the raiser of such cattle a price which will leave him anything after paying the expense of raising and marketing them, it is necessary that the greatest possible economy shall be used by the slaughterer, and that no particle of the animal shall be allowed to go to waste if he hopes to put products in the market of the consumer at such a price as will bring him customers.

"The price for all portions of the bullock, except those for the fancy cuts of prime beef to consumers, have declined in an equal degree with the decline in the price of the live animal, as an investigation of the prices of the different products of beef for a number of years will clearly show. The difference in the price obtainable for canned meats has been more marked than upon any other product of beef, and it is the direct result of the overproduction and over-marketing of inferior Southwestern cattle, and to competition with cheap frozen mutton and beef from Australia, New Zealand and South America in European countries. The magnitude of the canned-meat industry will be readily seen when it is known that during the year 1888, 584,333 cattle were slaughtered in Chicago for canning purposes, or almost one-third of the entire number of cattle slaughtered at that point.

"The depression in prices, and the present state of the cattle markets, are due to the overproduction, especially of grass-fed cattle, the marketing of immature animals, which are too thin for the block (this has affected all corn-fed and native cattle, except the choicest), and enforced competition of farmers raising cattle on higher-priced and highly improved farms of Illinois, Iowa, Missouri, Kansas and Nebraska, with the ranchers of the West and Southwest, who herd thousands of this character of inferior cattle upon public lands or lands of little value. The gradual absorption of the range by actual settlers, and overproduction of range cattle, has greatly overcrowded the remaining range country, and has, consequently, lessened the quantity of grass and impaired its nutritive quality. As a natural result, grass-fed range cattle have deteriorated in weight and value, and the Southwestern steers now coming in weigh from ten to twenty per cent less than the steers of a similar character did six years ago. Grass-fed Southwestern range steers are not as good to-day as they were then, and cannot be expected to command the same prices.

"A few years ago large fortunes were realized in the herding of cattle in all sections west of the Missouri River, and capital from New England, the Middle States, England, Scotland, and the Continent was recklessly invested in this new enterprise. Men without experience bought whole herds by brands and book account, supposing they were receiving what they actually paid for, and it is generally conceded that in few instances would the actual count of the animals exceed seventy-five per cent of the number shown by the book account. Because of the great demand for ranches, and consequently inflation of cattle values, investors often paid for such cattle greatly above their actual value. With the truth came distrust in the business, bankers called loans and refused accommodations, and a rush ensued on the part of many investors to market their cattle, and quit the business. Many other causes have since transpired to depress this branch of the cattle business, and to cause the overproduction of cattle, among which may be mentioned the thinning out of large ranches, as the Government lands have been taken up by actual settlers, the overcrowding of other ranges, drought and short pasture, severe winters and a necessity upon the part of cattle corporations and owners for the realization of quick profits to meet the payment of guarantee dividends or of interests and mortgages. I am fully convinced that the farmers of Illinois, Iowa, Missouri, Kansas, and Nebraska have suffered serious loss in cattle values because of the effect upon the cattle market of such overshipment.

"In recent years the cattle business has been conducted on a large scale by incorporated companies and wealthy individuals, who find it necessary to ship cattle to market in large numbers, and, therefore,

must have centralized markets in which they can easily and quickly dispose of them. The changed conditions of cattle raising have necessitated and compelled these large or centralized markets, as they are called, without which it would be impossible for large raisers and shippers to dispose of their cattle, and without which it would be impossible to successfully carry on the export trade in dressed, salted or preserved meats. Such markets are the effect of the present condition of cattle growing and marketing, and not the cause.

"Whilst it is admitted that heavy receipts of cattle, especially light ones, from the Southwest, has had a marked effect upon the cattle values of all beef animals, it will still be found true that really choice cattle usually command a reasonable price, because the supply rarely exceeds the demand. Four dollars per hundred weight was the lowest price paid for first-class stock in 1888; a fair average for the entire year would be about five dollars per hundred weight, and in many cases the price has run up to seven dollars. The complaints of low prices for cattle have come from the shippers of lighter grade, and only rarely from the owners of first-class stock.

"Another evidence of overproduction, and one which shows that the cattle raisers themselves recognize it as the true cause of depressing markets, is the large number of young cows and heifers which are being sent to the slaughtering pens, and the large number of young heifers that are annually speyed. When the ranches and farms are so thinned out as to make the supply of cattle nearer the demand, and when we can market our surplus abroad, we may expect to see steady and proper cattle value; for it is a well-established rule of trade, that the surplus of any commodity in the market will tend to reduce the value of the whole production of that commodity. The dressed-beef industry has proved most beneficial to cattlemen and beef consumers alike, for without it it is safe to say that cattle would bring a price sometimes not more than the freight. The dressed-beef business is so concentrated, and is conducted upon a scale of such magnitude, that dressed-beef men can profitably utilize the offal and other waste products of slaughtered animals, which are absolutely useless to small slaughterers.

"The dressed-beef business is protected by no patent. The methods employed in slaughtering the animal and preparing its products for the market are well known and open to any one who wishes to engage in it. Armour & Co. have wholesale beef markets and agencies throughout the country. Through the press and otherwise we advertise the products we have for sale and the prices, and keep our beef and our products constantly before the public. To these markets everybody is invited. Our prices are quoted to every inquirer, and any person can readily see for himself whether we are charging or receiving exorbitant prices or not.

"*There has never been any combination or agreement of any kind between the firm of Armour & Co., of which I am a member, and any other party or parties, to fix the price which we should pay for live cattle, or to control the price which should be paid therefor, nor has there been any attempt on the part of this firm, in connection with others engaged in the dressed-beef business, or with other purchasers of cattle, to control or depress the market for cattle.* The firm of Armour & Co. is not in any combination with other parties in the dressed-beef business, or with shippers of beef in the carcass to fix the price for which beef carcasses shall be sold. We do arrange price-lists for cut meats and canned meats from time to time with others producing those commodities. This is done according to the state of the market as to supply and demand, and is absolutely necessary to protect dealers in these articles from the sudden and violent decline in prices which would otherwise follow an oversupply. In no case are the prices quoted exorbitant, nor would it be possible to make them exorbitant and maintain them for any length of time. The almost unlimited supply of such cattle, and the limited demand with which the market affords for these articles, make the exacting of large prices impossible.

"We do the best we can to buy cattle as cheap as we can. As a good merchant, I would not be here very long if I would not do that. Look at the advertisement it would give me to the commission man, and it would go quick, instantly all over the wires. I could not do that with Mr. Swift without the commission man knowing it, and that would go direct to the men who ship the cattle, and the next time they would not come near me at all. I do not believe any man believes in this combination who will come to the market and go down to the packing house and see the methods and see our system. I do not think there is a man who would then say that. I am sure there is not a man who would. I

think there have been a great many people beyond cattlemen who, seeing this big decline, have believed there was something wrong, and that the Big Four was a Jesse James."

To this last remark Senator Vest replied: "I can say to you that I have never talked with one cattleman (and I have talked, I presume, with five hundred) who did not solemnly asseverate that he did believe it. One man said, somewhat cautiously, that he was not sure of it. I do not say that that makes it so, but I am talking about the public opinion existing."

Mr. Michael Lynch, of Saline County, Missouri, attributed the decline in prices to the combination, the existence of which Mr. Armour denied. "Before the combine," he said, with much earnestness, "I generally got paid for my corn and my labor. Since that has taken place I have generally worked for nothing; I do not get anything for my corn or for my labor either. I was up in Chicago last New Year's, on the second day of the month, with Mr. John Kennedy, a neighbor of mine, and Mr. Loftus, besides others from the same neighborhood. Mr. Kennedy and I had good cattle. The cattle cost me at home, north of Slater, four cents a pound. I bought them the first of September and fed them until the second day of January. They ate up about fifteen hundred dollars in corn. I had paid four cents for them, and they weighed one thousand one hundred and eighty-seven pounds a piece. They cost something like forty-six dollars cash at home. I fed them about fifteen hundred dollars' worth of corn, at thirty cents a bushel, or one dollar or one dollar and fifty cents a barrel. The corn would have brought me that much, or it may be more. I sold the cattle in Chicago, and I was probably out five hundred dollars or six hundred dollars, besides my corn. I had to pay interest on the money. A man who can not sell his cattle for something over and above what he pays for them generally has to go into debt for the price of the cattle. When I came back I had to repay that money to the bank out of my other funds. So I was out entirely. I do not see any competition there at all. I have not seen any, in fact, for three years that is worth speaking of. Heretofore, if a fellow came in to buy your cattle, and the bid did not suit you, he went out and another man came in directly afterward, and they kept on coming until you got something like the value of your cattle, and you finally sold them. You go there now, and stay all day, and see only two or three buyers, and they will always go together and give you one bid, and it may be they will raise five cents or ten cents on it, and you will have to take their bid or quit. That is my experience at least.

"Both Mr. Kennedy and I had one thousand four hundred and forty pound cattle. There was but a small difference between our cattle in weight. We got into Chicago, I think, at six o'clock in the morning. We went out and had breakfast, and came back to the yards immediately afterward. We were very anxious to sell our cattle and get home that evening. We held our cattle, I think, until two o'clock, and we only got a raise from four cents to four and one-tenth cents, and we never saw a buyer anywhere near. I know that none came around our cattle, because we were right with them in the pen all the time. None came around except those three men, and our commission man said those men belonged to the Big Four, but I do not know who they are. I have never seen them, but I have heard enough of them to know who they are. They are not a very good class of people. They skin poor men; at least they skinned me badly. I did not see any competition there at all. No other man made us a bid. Nobody came around our cattle who was buying."

An immense quantity of additional evidence was taken, and the inquiry extended over several months, the Committee meeting in different cities. We have extracted and condensed, from the immense mass of documents published by the Committee, evidence and statements which appeared to bear most directly on the causes of depression in the cattle industry. The Committee presented its report to the United States Senate in the spring of 1890, or about two years after it was appointed. The report is entirely too lengthy to be reproduced in full, and we must content ourselves with a few brief extracts from it and a general summary of results.

The report is distinctly unfriendly to the Big Four, and the International Cattle Range Association is charged by Senator Vest with having hindered rather than helped the Committee in its investigation as to the influence of the dressed-beef monopoly. The centralized condition of the cattle market is named as the principal cause of the reduction in prices, or, at least, as one of the most important factors. The Evener Combination, in the years 1873 to 1878, is severely criticised, and its marked influence in making Chicago the great cattle market of the country is proved by a series of figures.

Statements follow as to the growth of the dressed-beef business, and tables are given to show that while only thirty-eight per cent of the gross receipts of cattle went into the hands of those controlling this business in 1878, nearly seventy-five per cent went into their hands at the time of the investigation. In other words, while the number of cattle received at Chicago in twelve years had increased from one to three millions per annum, the number of cattle slaughtered for the dressed-beef trade had grown from less than half a million in 1878 to more than two millions in 1889.

Mention is made of the fact that the agents of the dressed-beef houses at first refused to appear before the Committee, and had to be forced into attendance by means of subpœnas. "In an atmosphere so hostile, and surrounded by such influences," the report goes on to say, "the Committee found their duties at Chicago singularly unpleasant and difficult. The people and press at Chicago naturally sympathized with the vast interest which expends millions of dollars weekly in that city, and from no quarter came the slightest sympathy or encouragement for those who were supposed to be even critical as to the packing and dressed-beef establishments. The overwhelming weight of testimony from witnesses of the highest character, and from all parts of the West, is to the effect that cattle owners, going with their cattle to the Chicago and Kansas City markets, find no competition among buyers, and if they refuse to take the first bid, are generally forced to accept a lower one. This testimony comes from representative men, not emotional or prejudiced, but conservative, intelligent observers, of whose sincerity there can be no suspicion."

The report goes on to point out that other evidence was forthcoming to prove the existence of a combination between the dressed-beef magnates, and the next section challenges the accuracy of Mr. Armour's argument that low prices were caused by overproduction. In 1850, it is pointed out, the number of cattle in proportion to population in this country was seven hundred and sixty-seven to every thousand. In 1860 the number had increased to eight hundred and fifteen, a figure which had never since been reached, although in 1885 it rose to eight hundred. At the time of the inquiry it was practically the same as it was in the year 1850, and exactly the same as in the year 1882, so frequently named as one of exceptional prosperity in the cattle trade.

Over-marketing is next dealt with as one of the causes alleged for the falling off of prices and the depression in the trade. The result of investigations convinced the committee that a very large number of people really believed six years ago, as they do now, that the over-marketing of beef cattle is one of the most obvious reasons for the falling off in the prosperity of the cattlemen. Witnessess had stated that the reckless investments in ranches and cattle made a few years previously by inexperienced speculators, and the reaction which had caused many to abandon the business in despair, had thrown upon the markets large numbers of immature animals, thereby producing an oversupply and a consequent depreciation of prices.

"It is said, and with much plausibility, that the reckless investments in ranches and cattle made a few years ago by inexperienced speculators, and the reaction which has caused many to abandon the business in disgust and despair, has thrown upon the markets large numbers of immature and unprepared animals, thereby producing an oversupply and consequent depreciation of prices.

"It can not be doubted that there is some truth in this statement, and that the facts alleged have contributed to present conditions, but it is impossible to accept this as the principal cause for low prices. As stated in the report of the Agricultural Department on the beef supply, 'The demand for meat for home consumption should be tolerably constant in a series of years like those of the present decade, during which there has been no marked financial depression.'

"In addition to this fact, it must be remembered that the demand for canned beef and of cattle for exportation has steadily increased. This being conceded, the market returns at Chicago should prove the truth of the over-marketing theory beyond question. If over-marketing has been the principal cause of low prices, then this cause should operate regularly and systematically in the same direction from month to month. When a large supply of cattle is in market, prices should decline, and with a decreased supply they should go up. Of course, no one can expect, in any market, a mathematical and procrustean rule as to anything, but, supply being the controlling factor, prices should be governed accordingly, or the conclusion is irresistible that some other and more potent cause is controlling. Keeping before us the fact that population has been increasing in a greater ratio than cattle, as shown

by the report on the beef supply already quoted, and the additional facts that exportation and improved methods in preparing the beef product and its transportation have increased the demand for cattle, we invite attention to the following, taken from the official reports of the Union Stock Yards at Chicago:

"In August, 1886, there were received at the Union Stock Yards, 86,130 range and Texas cattle, which sold at the average price of $3.20.

"In September, 1886, there were received of the same grade, 114,566 cattle, which sold at $3.00.

"In October, 1886, there were received of the same grade, 134,639, which sold at $3.05.

"In November, 1886, there were received of the same grade, 73,488, which sold at $2.90.

"In December, 1886, there were received of the same grade, 25,060, which sold at $2.80."

Attention is called to the fact that in his testimony, Mr. Armour emphasizes the statement that the fall in prices has been greatest in grass-fed range and Texas cattle, and the committee therefore selected this grade to test the theory of over-marketing.

It will be observed while in September, 1886, there were received at the yards 114,566 of these cattle, the receipts increased in October to 134,639, but instead of decreasing the selling price it rose from three dollars to three dollars and five cents. In November the receipts of these cattle decreased 61,171, but the selling price instead of rising under a short supply actually fell from three dollars and five cents in the preceding month to two dollars and ninety cents. In December the receipts were only 25,060, a decrease from November of 48,388, but instead of raising prices they fell to two dollars and eighty cents from two dollars and ninety cents in November.*

The following tables were regarded by the Committee as showing conclusively that overmarketing does not explain the fall in prices.

Texas and range cattle received at Union Stock Yards:

TEXAS AND RANGE CATTLE RECEIVED AT UNION STOCK YARD.

MONTH.	1886		1887		1888		1889	
	Price.	Number.	Price.	Number.	Price.	Number.	Price.	Number.
September	$3 00	114,566	$2 65	130,424	$2 80	115,719	$2 55	145,885
October	3 05	134,639	2 60	162,442	2 65	163,509	2 70	182,407
November	2 90	73,448	2 50	121,419	2 80	104,725	2 65	95,757
December	2 80	25,060	2 40	64,700	2 65	44,700	2 50	33,115

The prices in the above are the highest for the months named. The following table gives the range of prices at Chicago, from the highest to the lowest in all the months of 1889:

MONTH.	Fancy and export.	Western range.	Texans.	Cows, light stock.	Stockers.
January	$4 25 to $5 40	. . . . .	$2 70 to $3 75	$1 50 to $3 00	$2 65 to $3 30
February	3 75 5 00	. . . . .	2 30 3 30	1 50 3 00	2 35 2 25
March	3 75 4 85	. . . . .	2 50 3 65	1 50 3 00	2 00 3 35
April	4 00 4 75	. . . . .	3 10 4 00	1 50 3 15	2 90 3 60
May	3 90 4 60	. . . . .	2 40 3 65	1 50 3 80	2 50 3 75
June	4 00 4 70	. . . . .	2 10 4 00	1 25 3 35	2 25 3 35
July	4 00 4 55	$2 40 to $3 65	2 45 3 65	1 50 3 00	2 50 2 85
August	3 75 5 00	3 55 4 10	2 00 3 10	1 40 2 60	1 75 3 25
September	3 80 4 80	2 75 4 00	2 00 3 10	1 50 3 00	. . . . .
October	4 00 5 15	3 00 4 00	2 20 3 40	1 75 2 74	2 15 2 75
November	4 20 5 50	3 00 4 00	2 00 3 15	1 50 2 75	2 00 2 80
December	3 90 6 10	2 50 3 40	1 80 3 40	1 25 2 75	5 20 2 80

*The members of the Senate Committee appear to have overlooked the fact that the very small shipments in December were partly the results of force of habit or custom, and partly of the miserably low quotations, which made cattlemen hold back as long as possible.

Nothing could more completely dispose of the overmarketing theory than the fact that in October, 1889, there were marketed at the Union Stock Yards more Texas and range cattle than in any other month since the yards were established, the increase being 36,522 over the preceding month. Prices rose under this unprecedented market from two dollars and fifty-five cents to two dollars and seventy cents. Not only does the overmarketing theory fail as to Texas and range, or grass-fed cattle, but the prices of the better grades sold at the Union Stock Yards show the same result.

In August of the same year the number of all grades at Chicago was two hundred and ninety-seven thousand, and the average price of beeves, weighing from twelve hundred pounds to fifteen hundred pounds, for that month was three dollars and ninety-five cents. In September of the same year there were in the Union Stock Yards two hundred and seventy-six thousand cattle, and the average price of the same grade of cattle was three dollars and ninety cents. In October the number marketed was three hundred and thirty-one thousand, and the averaging selling price of beeves, weighing twelve hundred pounds to fifteen hundred pounds, rose from three dollars and ninety cents to four dollars. In the next month, November, the whole number of cattle marketed fell to two hundred and sixty-one thousand, but the price of the grade above mentioned fell also to three dollars and eighty-five cents, instead of rising as it should have done. In December of the same year the whole number of cattle at Chicago decreased to two hundred and fifty thousand, but the price of the same grade we have named still further declined to three dollars and eighty cents.

The official sales at the Union Stock Yards for the years 1884 to 1888, from month to month, show beyond a question that overmarketing did not cause the decline in prices. "There is some other more potent factor at work," says the report, "*and we have no hesitation in stating as our conclusion, from all the facts, that a combination exists at Chicago between the principal dressed-beef and packing houses which controls the market and fixes the price of beef cattle in their own interest.*"

An advertisement from an English paper is next quoted by the Committee to show that in one year the Big Four made a profit equal to about twenty-nine per cent of its capital stock, and other figures are quoted to show that on a steer purchased for twenty-five dollars, there was a clear profit to the dressed-beef men of seven dollars and thirteen cents. It did not appear to the Committee that the retail butchers were responsible for the high prices of beef still charged to consumers. After making several inquiries on this subject, the Committee came to the conclusion that while there were individual butchers whose charges were excessive, retail butchers, as a rule, were making not more than eight or ten per cent on their investments. A table is given showing that even with the low prices for cattle, which were enforced at the end of the eighties, choice cuts, including porter-house and surloin steaks, were actually commanding higher prices per pound than in 1870.

Mr. Armour had explained this to the Committee by stating that there had been an increase in the demand for the choicer cuts of beef not kept pace with by the demand for cheaper cuts. During the five years then preceding, there had been a falling off in the price of cattle on the hoof from an average of five dollars and thirty-five cents per hundred to three dollars and eighty cents per hundred, and it was impossible for the Committee to conclude that during this brief period the taste of the consumers underwent so marvelous a development that the rib and loin beef could alone satisfy it. "Unless," the report goes on to say, "the retail butchers are the most conscienceless liars in existence, the profit does not go to them. The Committee is satisfied that the bulk of the profits unquestionably made under present conditions goes to the combination of dressed beef and packing houses."

The remainder of the report consists of an exceedingly interesting dissertation on transportation rates, followed by a number of suggestions as to inspection and by a number of figures as to the growth of the export beef trade. The monopoly of export transportation is commented upon, and the Committee concluded its labors by making a variety of suggestions, to which we shall allude in the next chapter, the scope of this chapter being an inquiry into the causes of the depression and the circumstances, errors of judgment, combinations, etc., which brought it about, rather than remedies for those evils.

CHAPTER X.

Remedies Suggested for Stagnation and Low Prices.

THE present outlook for the cattle trade of the Southwest is decidedly brighter than it has been for several years. In the opinion of many most competent judges, the excessively high prices of a dozen years ago are not likely to be reached again for a generation, unless a cattle famine should set in, in which case there will be, for a time, no limit to the offers made for cattle of almost any description for slaughtering purposes. But during the last few months there has been a distinct improvement in the general demand, with a general stiffening of prices, and cattlemen speak much more hopefully now than they did two years ago. Texas cattlemen, in particular, have come to the conclusion that it is a condition and not a theory which confronts them, and they have accordingly taken steps to prevent a recurrence of the calamity of the last few years. Of the success which has attended the efforts made in the direction of improving the breed of cattle we shall speak at length later, and may only pause to remark here that this in itself will prove a most important factor in competition with cattle raisers and feeders elsewhere.

The stall-feeding of cattle has also received in Texas, during the last few years, the attention it deserves. Steers are being fattened on cotton-seed meal by the tens of thousands with exceedingly satisfactory results. Cattle so prepared for market seldom go begging for buyers at reasonable prices, the great falling off in demand and in quotations having been in lighter grades of steers. The altered conditions which prevail in what was formerly the greatest range district in the world, have rendered these changes in the methods of cattle-raising and feeding imperative, and the manner in which the changes have been realized and accepted speaks volumes for the intelligence and good sense of the cattlemen generally.

The Senate Committee, to whose labors we referred at length in the preceding chapter, suggested a number of remedies for the depression it discovered, or rather whose existence it admitted. So far as we have been able to learn, very little practical benefit has resulted, and the inquiry must be regarded as of greater value from an educational standpoint than from a purely practical one. At the very outset of its report the Senate Committee states that so long as the combine at Chicago can dominate the entire cattle market, depression is inevitable. The market might rally and advance for a time under manipulation, brought about to induce shipments, but the same conditions would, in the long run, prevail as during the preceding five years. It is pointed out that Congress cannot give relief against trusts and combinations confining their operations within State lines. This relief could only be given by the State authorities. The bill recently passed by the Senate on the subject of trusts would, if it went into operation and were enforced, have some effect on the illegal conspiracy to keep down prices; but it was useless to disguise the fact that desperate exertions would be made to nullify any legislation offering a remedy.

The committee quotes the various attempts to enact local inspection statutes in State Legislatures as evidence of the means which would be used by those now controlling the cattle market to defeat all interference with their profitable pursuit. Without expressing any opinion in regard to the propriety of such legislation, the committee mentions as a matter of history that laws providing for the local inspection of cattle on hoof before being slaughtered had been declared invalid by judicial tribunals in Minnesota, Indiana, Kansas and Virginia.

The report concludes with an address to the cattle raisers of the United States, which is so full of thoughtful advice and so commendably brief that we reproduce it in full:

"If the cattle raisers of the United States are only true to themselves, the immediate future promises deliverance from present evils. There is no excuse for panic. The worst feature of the cattle trade is the fact that so many cows and calves are being thrown upon the market, the indication being the producers are panic-stricken and anxious to realize without regard to the future. There were marketed

at Chicago during the past year 3,023,281 cattle, of which from twenty-five to thirty per cent were cows, and four per cent were calves. A little reflection will satisfy every man that no combination can keep the prices of beef cattle at present quotations. The population of the country is increasing in a wonderful ratio, and of course the increase is greater each year. The foreign demand for American beef is annually growing, and it can only be a short time until our stall cattle will be admitted into the United Kingdom. The British cattle raisers are earnestly opposing the removal of all restrictions upon the importation of such cattle, but if our authorities earnestly address themselves to the task the difficulty can be removed.

"Besides, the cattle-growing region in the West is being rapidly limited. The admission of new States and the settlement of agricultural lands, the quantity of which is enlarged by systematic irrigation, must necessarily decrease the grazing area. While this is so, there will be an increased demand for beef with increased population, and enlarged facilities for the preparation of beef and its transportation to new markets.

"It is impossible that the Chicago market should continue to control the cattle interest of the whole country, as it does now, or that a few large operators shall retain their hold upon that market. This is a new country, not yet out of its first national manhood, and rapid development, with the phenomenal transition from one commercial condition to another, must attend our future. The center of population is moving westward, and the center of trade must change with changing population. As lines of railroad penetrate the continent, and new territory is opened to commerce and production, the distributing centers must, of course, be affected, and so it will continue to be until our country has reached the last stage of national development and danger—that in which the soil is sustaining human life to its fullest capacity.

"The cattle raisers of the United States should be, and are, the most competent judges as to their own interest; but if they will accept a suggestion from those whose duty it has been for months to examine the cattle question in all its aspects, they will cease marketing their breeding and immature stock, and diligently prepare for a larger supply and a brighter future. It is only a question of time, and very brief time, when the problem will be that of supplying our own people with beef, without regard to foreign markets.

"Under present conditions, and until we escape from the abnormal and ruinous centralization of the cattle market and its domination by a few men and railroad corporations, every effort should be made for deep-water improvement on the Gulf of Mexico, diplomatic endeavor to remove quarantine regulations in Great Britain, national inspection, and the prohibition of monopoly in steamship transportation, to enlarge our foreign market; but eventually it will require all the cattle produced in this country to supply the home demand."

Passing from the Senate Committee and its labors, we come next to the attempts made by the butchers of the United States to fight the dressed-beef combine, or the Big Four. These efforts were commenced nine years ago, and have been steadily continued year after year. The Butchers' National Protective Association was established in 1886, and its first Convention was held in St. Louis in May of that year. Its officers have always claimed that its interests were distinctly allied with, and not antagonistic to, those of the cattlemen, and the greatest efforts have been made, from time to time, to enter into alliances calculated to defeat the Big Four and its agents. The contention has been made that, while the prices of cattle on the hoof have fallen, the prices of butcher's meat have been stationary, and that when prices of meat have increased, neither the producer nor the retailer has reaped the benefit.

The butchers attribute the falling off in the prosperity, both of the cattle and the retail butcher trade, to the Big Four, and their hostility to that combination has at times been almost picturesque. At the first Convention held by the body to which we are referring, Mayor Francis spoke very plainly about the danger of monopoly. "A sad day," he said, "it will be for this country when the dressed-beef interests are in the hands of a few moneyed kings. A sad day it will be for the farmer who raises the cattle when a select coterie can establish the price, which they will pay, from day to day, for the cattle which are brought to market, and a sadder day it will be for the people at large who consume this beef."

The Mayor's coupling of the two interests was received with enthusiastic applause, and the Convention got down to business with very little delay. One of the first speakers, Senator McGinniss, gave his attention very considerably to the live stock interest. "This dressed-beef movement," he said, "has already very seriously affected the live stock business, receipts on the hoofs during the last few years not having kept pace with the increase in population and consumption. In fact, it is claimed that the receipts now are not actually equal to what they were five years ago. If the live stock trade from the West and Southwest were alone affected, this would not be of such grave importance to the country, but it is also very seriously affecting the beef production of the Middle and Mississippi Valley States. It is a part of the policy of this syndicate to discourage and reduce to a minimum the beef production of the corn belt of the United States, so that it may have a freer field for its operations.

"A blow most serious, far-reaching and lasting in its results, is thus being struck at the farming interests of the region named. It is only within the last few years that the farmers of this great district have come to understand generally that tame grasses and cattle paid better, and was more reliable, than such crops as wheat, corn and hogs; and in the meantime they have come to understand, too, that grasses and cattle return, to the almost exhausted soil, those elements of fertility of which it has been depleted by a long and almost unbroken succession of cereal crops. Competition with the cheap, nasty dressed beef, will compel the abandonment of this system, to a large extent, and millions of acres will be turned from pasture lands into wheat fields, and the manure, which should go towards enriching those fields, will become dust and be blown away on the plains of the great cattle ranges, and we of the cities will have no cheaper beef for it all in the long run."

The Senator went on to point out the difficulties in the way of legislation. While Mr. Vest had expressly stated that legislation aimed at checkmating the combination of which he complained must emanate from State Legislatures, Mr. McGinness argued as a lawyer that it must of necessity emanate from Congress. Differences of opinion, such as these, have intervened to the hindrance of good work again and again since the efforts at reform commenced, and possibly these differences are the prime cause of the practical failure of nearly every remedy attempted.

The committees of the association, as well as the parent body, worked hard for several days and passed a number of important resolutions bearing on the subject, as well as many relating to the plans to be adopted in the future. The members of the association pledged themselves not to trade in monopoly dressed beef, and to protect home industry in every legitimate manner. As an evidence of its determination to do this, it deliberately invaded the camp of the enemy and held its second Convention in Chicago. The Mayor of that city sent an apology for being unable to work on the delegates, but that did not prevent a very active campaign being inaugurated. President Thomas Armour, who, it may be explained, is not connected in any way with the dressed-beef millionaire, delivered a most carefully prepared address, in the course of which he referred to the cattlemen's difficulties which were then, 1887, at their height. The uninitiated, he pointed out, were wondering how it was that cattle were being marketed at such low prices on the hoof without any corresponding reduction in prices by retail butchers. The fact could easily be explained, and the cattlemen had been wrestling with it for years. He wanted to make it clear that in the beef supply of the country certain agencies were necessary between the producer and the consumer. The producer who lived away from the markets required some one to sell for him whom all recognized as the commission man. The consumer could not handle the cattle and these two middle men were always necessary. In olden times all subjugated countries paid tribute to Cæsar. Chicago had become the Rome of the cattle trade, and every beef that was sold in the United States had to pay tribute to the modern Cæsars. Various plans had been suggested for getting rid of the incubus of this monopoly. His idea was to secure slaughter houses in central points and fight the dressed-beef monopoly with its own weapons. Such a plan could be conducted at a profit, and it would really solve the difficulty to a great extent.

Mr. Bentley was introduced to the meeting as a member of the great community of Texas cattlemen, and he made a very interesting address bearing upon the question in which the cattlemen took so much interest. After explaining that he lived in the land of the longhorns, and knew something about the influences which had depressed the stock business for the last two years, he said he had come to the conclusion that the only hope of redress for the range-country stockman was in an earnest and

hearty co-operation with the butchers of the country. Only recently he was told by a member of the dressed-beef syndicate that capital had enabled them to secure control of the beef markets of the country. And what had been the result of the doing away of the competition? Cattle which two or three years before had fetched them from fifty to eighty dollars per head now rarely brought more than twenty or thirty dollars, and the producers generally had suffered a loss of a fifty-per-cent production on their cattle generally. He asked the butchers of the Convention to unite heartily with the cattlemen in a vigorous fight on the monopoly, and believed that if this was done the power of the combine could be broken.

Several other speeches followed in the same vein, and Mr. Barber, of Washington, gave an interesting summary of dressed-beef combines and their immediate results, the Convention finally adjourning full of hope as to the future.

In 1888 the association met in Philadelphia to resume its attacks on the combination, which, it believed, had interfered so seriously with its business. Many points to which we have already alluded were brought very prominently to the front; and an address was delivered by Mr. A. S. Mercer, of Cheyenne, Wyoming, which brought to a focus the great points at issue between the parties. From his speech the following extracts are taken because of their practical bearing on the subject:

"There are to-day one hundred thousand men in the United States engaged in the work of butchering cattle, cutting up meat and supplying it to the consumer. There are to-day nearly half a million men in the great West engaged in the business of raising cattle to sell to the butchers. There is a community of interest between the producer of beef and the butchers of the United States; the producers' interests are yours, and your interests are the producers'. Hence, no question is more important than that of unity of action between the producer and the manipulator of meat, and between these two and the consumer, who represents the great mass of people. To-day sixty million people in the United States are listening for the voice that shall go out from this Convention on the question of adulterated food. The women and children of this country, even the little ones that are nestling in their mothers' laps, are interested in this question. It is a question whether we will raise up strong men and women or a race who may be tainted with leprosy. It is not a question of a moment, but one that shall reach down through all time.

"I want to make one or two general propositions, which can be substantiated any moment by figures. In 1883 Chicago, St. Louis and Philadelphia, the old Centennial city, were great cattle markets. New York, Baltimore and other cities were not only great commercial and manufacturing cities, but the live bullocks of the West were found there in your stock yards, were brought there by the butchers, were slaughtered there, and good beef was to be found everywhere. To-day there is but one market in the United States, and that is at Chicago. In 1883 from fifty to one hundred buyers were to be seen daily in the stock yards at St. Louis—buyers from New York, Jersey City, Philadelphia and all the other markets—and there was a legitimate, honest competition by men who wanted the products of the West. Cross the river and enter the National Stock Yards at St. Louis to-day, and you find no buyers other than a few of the local residents who want a bullock or two slaughtered. Go to Kansas City, and you find, notwithstanding the great, overshadowing dressed-beef houses standing there, there are no buyers. New York is not represented there, Boston is not represented there, Philadelphia is not represented there; none of the great consuming centers are represented even in that marvelous young city on the borders of the Missouri. The same thing is true of Omaha. Every place to which the cattle of the plains were formerly brought presents the same condition until you get to Chicago.

"In 1883 fourteen hundred and forty-one car loads of live cattle were hauled over one line of road from the West, and distributed in Philadelphia and Jersey City markets. In 1887 less than one hundred car loads were hauled by the same road and dropped at these two points. Why was this? It was because the supply was diverted to Chicago. In 1883 the same line of railroad delivered to Chicago, out of its entire haul of five thousand car loads, only thirteen car loads. Last year all of its haul went to Chicago. In 1883, when the people were paying for their chops, steaks and roasts no more than they are paying to-day, we were getting forty dollars for a steer. At that time Texas, the mother of the plains-cattle industry, was driving or shipping yearly one hundred thousand beef steers to New

Orleans and other Southern cities. After being driven across the State and shipped across the Mississippi, they were sold to the butchers and slaughterers at home. To-day New Orleans, Memphis and all those places are supplied with refrigerator beef from Chicago; the live cattle being shipped to Chicago, instead of going direct to New Orleans, and the beef being sent down in ice boxes—and I need not speak to you of the ice box as a source of epidemics.

"We have heard much talk about the wonderful Big Four at Chicago. What does it mean, and who are the Big Four? That is a question that comes straight home to the butchers, and it comes even a little straighter home to fellows like ourselves out West, who raise the cattle. It is simply a combination in Chicago of four men, who handled last year over one million and eight hundred thousand out of the two million and three hundred and eighty-two thousand head of cattle that were thrown on that market. Five-sixths of all that immense collection of cattle delivered in Chicago were bought, slaughtered and shipped out by four men.

"Now, what is this leading to? This question is one for the consideration of the butcher and the producer. We are both in the same boat. If four men in Chicago can to-day handle five-sixths of the beef product of the United States, and if those four men have, as I understand from unquestionable authority they have, ruled out one-half of the butchers of this country, how long will it be until they have controlled the other sixth, or until the other half of the butchers of the country will become mere cutters of meat for these four men?"

Mr. Mercer's address caused special prominence to be given in Eastern and central circles to the Wyoming Stock Growers' Association, which was one time regarded as the most powerful cattlemen's organization in the world. Its roll of membership was at one time magnificent in its proportions, and many of its members amassed large fortunes during the balmy days of stock growing. Its operations were mostly carried on by an Executive Committee made up of representatives from Laramie, Albany, Carbon, Sweetwater, Uinta, Fremont, Johnson and Crook Counties, Wyoming, and Cheyenne and Sioux Counties, Neb., Dakota and Montana also being represented. Resolutions of a very important character were passed from time to time by the association, some of them being designed to generally regulate the affairs of the trade, while others were more distinctly prepared with a view to helping out the trade in its depressed condition. Early in the eighties, or just at the time when the trade was at its turning point in the matter of prosperity, the association divided Wyoming into round-up districts, and prohibited the branding of cattle between February the 15th in any year and the general spring round-up. It also issued a series of instructions to round-up foremen of the most valuable character, although they are more a relic of the past now than of any practical utility, owing to the changes in the condition of the country and methods of herding and raising cattle.

The Wyoming Association was a member of the National Cattle Growers' Association of America, generally called, for the sake of brevity, the Chicago Association. It also recognized the International Range Cattle and Horse Growers' Association, and generally evinced a desire to co-operate with any institution designed to better the interests of its members and of the cattle interests generally. In one year it recovered and returned to owners three thousand head of cattle which were detected at various shipping points and Indian agencies. A great deal of attention was directed to inspection, and to investigations as to diseases of cattle and how they could be defined and detected. The organization also did good work in securing territorial legislation, including bills regarding branding, the payment of damages for live stock killed by railroads and injured by dogs, as well as local inspection methods based upon rules of common sense and good judgment. That the word "Maverick" is not confined to Texas, and that it acquired what may be termed a classical or strictly regular significance outside that State, may be gathered from the fact that the Territory of Wyoming passed an act several years ago entitled an act to provide for the gathering and sale of mavericks, a measure which, by the way, had many points to recommend it.

Before the Convention adjourned, it was resolved that the Chair appoint a committee of five members, with full power to act, to confer with the International Range Association for the purpose of establishing closer relations between cattle raisers and butchers. Resolutions were also passed thanking the members of the Vest Committee for the efforts they had made to unmask the dressed-beef monopoly, and get at the truth of the very important question which affected them all so much.

The association, which was now more closely affiliated than formerly with the cattlemen, met the following year at Detroit, to resume its efforts and to carry on its attacks on its much-hated foe. The question of beef inspection was the most important one that came before the meeting. The friendly relations which had been established a year before with Mr. Mercer, of the "NORTHWESTERN LIVE STOCK JOURNAL," were severed, and that gentleman was referred to in very severe terms, on account of his alleged failure to advocate the cause which he and the butchers were supposed to be fighting for in union. A resolution was passed severing the connection formed the preceding year, and from the standpoint of the cattleman very little was effected in the way of co-operation. The Committee appointed to meet the National Range Association reported certain results of a more or less indefinite character, and the Convention finally adjourned, to meet again the following year and resume its crusade.

During the same year, 1889, St. Louis was again the scene of a great Cattle Convention. This time the grand hurrah which characterized the proceedings of 1884 was conspicuously absent. Instead of a vast number of prosperous business men meeting to compare notes and exchange congratulations, it was rather a gathering of stern, indignant gentlemen demanding certain rights at the hands of the Government and the country. Colorado, Iowa, Minnesota, Kansas, Indiana, Texas, Missouri, Illinois and Nebraska were represented by large delegations, and the Convention, whose stated object was to determine upon proper means to abate the evils brought about by the beef combine, got down to business very rapidly.

Senator Gillette, of Kansas, who was called to the chair prior to regular organization, delivered an address marked by great earnestness, and he was followed by others who spoke with equal force. Mr. Mercer, of Cheyenne, Wyo., having lost favor with the dressed-beef men, his admission to the floor was in consequence contested, with the final result that he was declared not entitled to a seat in the Convention. An immense number of resolutions were submitted and discussed, one after the other, until it was finally determined to concentrate efforts on two bills, one of which called for the suppression of trusts in a more vigorous manner, and the other calling for local inspection. Neither measure has been enacted in the comprehensive manner desired, and hence the wisdom of those who drafted the bills cannot be fairly criticised or commented upon. Great satisfaction was, however, felt by all present at the result, and the members went home feeling, at least, that they had succeeded in getting in the thin edge of the wedge against the hated combine.

The Butchers' National Association met at Cincinnati in 1890, when Mr. S. D. McCormick delivered a characteristic address on the conditions of the beef industry, from the branding of a calf to the selling of a porter-house steak. Mr. McCormick's style is well known, and the force of his indictments is unlimited. He opened his remarks by characterizing the cattle pool as a "despoiling agency," and directed his attention to a series of inquiries as to how the cattle industry could be rescued from it. He considered that the very existence of the cattle interest was at stake, and that it was only necessary for the butchers to combine with the dressed-beef men to practically annihilate the cattle-growing interests altogether. Unless something definite could be done, and done promptly, the United States would soon be compelled to import beef from other countries at a loss terrible to contemplate.

Taking Senator Vest's report as his authority, Mr. McCormick traced the history of the combine, and denounced it in unmeasured terms. A few years ago, he pointed out, millions of cattle were breeding and growing on the hills and dales of the United States. The business was active and competition was rife. A mature bullock was worth from one hundred dollars to one hundred and twenty dollars, while at the time of which he was speaking an animal of the same grade and weight was of little or no value on account of the killing of all competition. He denied, very vigorously, that overproduction was the cause of this difficulty, and argued that under present conditions the ranchman was in the position of a slave, living in fear of a boycott and unable to transact business on a living basis. The men who must be made the champions of the movement they had in hand had to fight, not to cripple the combine, but to annihilate it. They could help do this by the measures recommended by the Vest Commission, though this in itself would not meet the case. His plan was to counter-organize. His remedy was not revolutionary in character, but it involved the organization of those interests which were dependent upon the live stock market. This could be done by the butchers and the cattlemen

combining in one grand effort, and working hand-in-hand to crush out monopoly and maintain prices, not at unreasonable figures, but at competition prices.

As a result of this spirited address and other speeches which followed, the following preamble and resolution was adopted: "Whereas, it is important to sustain many of our languishing interests, particularly the cattle industry; and whereas, this Convention is ready to co-operate with any fair plan which shall organize and utilize the opposition to monopoly; Be it resolved, That this Convention appoint a Committee of not less than five or more than nine, which shall include the President, and that this Committee shall be known as the National Conference Committee of the Butchers' National Protective Association. The object of this Committee is to further the organization and the advancement of the interests of the Butchers' Association; to confer with other industrial committees, and to devise ways and means to sustain the live-stock markets of the United States. To this end, this Committee is hereby armed with plenary powers to reassemble this Convention at any time; to treat with all similar committees appointed by other representative industries; to receive suggestions, and to aid all just efforts tending to build up our interests in pooled cities, or any places where competition is now destroyed, and to devise some concert of action between cattle producers and consumers, especially in counties or cities threatened by the combine."

The resolution was not regarded as a mere matter of form, nor was its passage looked upon as settling the questions at issue for all time. The association, and more especially its indefatigable Secretary, Mr. Christopher Brokate, of St. Louis, lost no time in hunting up practical measures for fighting the hated combine with its own weapons. At the next Convention, which was held in Allegheny City, Pennsylvania, in 1891, it was announced that arrangements had been made with representatives of the great cattle interests of the Texas plains. As one of the speakers enthusiastically put it, "Texas is with us. Yes, thanks be to God, where the cattle is raised, on the great plains of Texas, where to-day they are feeding cattle enough to feed the whole world if necessary. They are with us, and I tell you that before this Convention closes I hope steps will be taken to effect the object we have in view." This object was the establishment of abattoirs and packing-houses on a large scale in Texas. It was argued with much force that the dressed-beef interests could be easily combated by the establishment, on a co-operative plan, of slaughter-houses near the plains on which they were raised.

Mr. A. Gardner, of the Dallas Stock Association, explained a proposal to establish a mammoth refrigerating plant in Dallas. It was proposed that the Butchers' Association should place a five hundred thousand dollar plant in the city named, receiving from the Board of Trade a bonus of one-tenth

that amount. He believed that the cattlemen would subscribe a hundred thousand dollars or more stock, and that the proposition would culminate in results of a most beneficial character to all concerned. It was finally resolved that the National Protective Association endorse the movement of the butchers of Dallas in building an abattoir and stock yards, and it looked for the moment as though the matter was definitely settled. Representatives of Fort Worth and other cities of Texas gave life to the movement by offering a little competition, and once more there was a prospect of a new market opening up for the cattle of the Southwest.

In May, 1892, the Convention met at Dallas with a view to completing the arrangements suggested and outlined in the East the preceding year. Mr. F. F. Elliott, of Dallas, in an address of welcome to the delegates, spoke with much enthusiasm as to the prospects. There were in the State, he pointed out, eight million head of cattle, one-tenth of which were beef steers. The feeding of cattle had been conducted on a more systematic plan of late than formerly. Vast quantities of local products were available for this purpose, and, in addition, cotton-seed meal and cotton-seed meal cake had come into use. Eighty tons of cotton-seed meal cake had been crushed the preceding year; and this, mixed with the hulls or with hay, was capable of fattening a quarter of a million steers in a hundred days. Dallas was in every respect suitable for the great refrigerating plant proposed to be put in, and the city was prepared to put up a fifty thousand dollar bonus for the purpose of encouraging the location. The special committee appointed at the preceding Convention for the purpose of selecting a site reported in favor of Dallas, strongly advocated the proposition, and recommended that the Butchers' National Association issue four thousand five hundred shares of stock at a hundred dollars a share.

The matter was not allowed to go through without competition, Kansas City, Austin and Fort Worth being competitors for the plant. After the claims of each city had been presented, Mr. J. S. Armstrong spoke in favor of Dallas and presented some arguments in favor of discontention. He pointed out that the freight on dressed beef from Dallas to New York was seventy-five cents. The cost of taking a steer from Texas to Kansas City was fifty-five cents, with additional charges which made a total of $1.10 a hundred pounds. This showed a margin of profit in favor of local slaughtering. Beef could be turned out and sold for two and a half cents dressed at Fort Worth, Austin, Dallas or any other of the points named, which would not be worth more than two cents had it been killed in Kansas City, on account of the bruising. These figures were unanswerable, and he considered Dallas exceptionally able to meet all requirements of the projected enterprise.

Finally, Dallas was unanimously selected for the purpose in view, the Austin representatives graciously voting for that city when they saw that the general feeling was in its favor. Mr. Secretary Brokate, in commenting on the result, said that, at last, steps had been taken to hit the combine with its own club. If the cattle raisers of the West would show their courage, he would guarantee that the butchers would show theirs. He would remind the cattle growers that the butchers had been the first to raise the cry against the Big Four. He regretted that the joint Convention of butchers and cattle raisers called at St. Louis had resulted in a fizzle, and he hoped that this time satisfactory results would follow.

Unfortunately for all parties concerned, the hopes of the Secretary were not realized. We are aware that the project was not universally approved in Texas and the Southwest, but we are inclined to attribute its failure much more to the depressed condition of the cattle trade than to any feeling of either animosity or indifference. More than once it has been pointed out in this work that, during the immense activity of the cattle business, large sums of money were borrowed from time to time for the purpose of investment, or, perhaps, over speculation, in stock and lands. The calling in of loans has been mentioned as one of the most obvious causes of the depression in the industry. It induced, among other results, an undue marketing of unripe cattle, and it also spread a feeling of alarm against anything bordering upon speculation or the incurring of additional liabilities.

Hence, although the Butchers' National Abattoir Association of America was permanently organized, it did not achieve the object in view. The Eastern butchers failed to contribute stock as liberally as expected, and it was also found that the expected financial support did not materialize from the stock-growing districts. Hence, like so many other efforts that have been made to restore the cattle trade to a condition of prosperity, and like so many cattle-growers' associations, the movement

passed peacefully and sadly into history. Other refrigerator plants have been erected and operated in Texas, as already stated. At present none of these are operated on a scale of great magnitude, though some are doing good work and rapidly bringing themselves to prominence and importance. So far as the National Butchers are concerned, the failure of the grand culminating effort at Dallas put a stop to the co-operating movement with the cattlemen, and the National Association is now confining its attention to matters more directly of immediate concern to the retail butcher trade. The feeling against the dressed-beef interest is much less marked than formerly, except among a minority of cattlemen and a majority of the butchers. The "Big Four," as it is almost universally called, continues in operation and appears to be making money just as rapidly as ever, in spite of rapidly increasing competition in almost every direction.

It must not be supposed that the feeling against the Big Four was unanimous. One gentleman who does not care to be quoted, but who has served a life-long apprenticeship to the cattle trade, said to the writer recently. "The attacks on the dressed-beef people were, in my opinion, the work of demagogues rather than practical men. Of course, the Big Four bought as low and sold as high as they could, just as any trader does. But I doubt whether there was ever any immoral combination to keep down prices of cattle on the hoof. It has been said that the Big Four killed the St. Louis market, and made Chicago the greatest cattle market in the world. It did nothing of the kind. It was hope that made Chicago take the lead. The cattleman, when dissatisfied with prices, will almost always go farther in the hope of doing better, even if authentic quotations show that he takes grave chances in doing so. Thus, whenever a man at St. Louis or any other intermediate market thinks he is offered too little for his stock he has reshipped it to Chicago, and I believe millions of dollars have been lost in this way by shrinkage, freights and disappointment. This same 'hope' is the reason why the refrigerator plants near the ranches have not done the business which was legitimately theirs. As long as there remains a chance of getting a fraction more by shipping farther, that chance is going to be taken, no matter what the risks may be. In my opinion, and I think I know what I am talking about, Texas cattle would be selling to-day at one dollar and fifty cents a hundred were it not for the dressed-beef plants, which take care of the surplus product."

It has been sometimes said that a man with a number of physicians is in as much danger as broth which is watched by too many cooks. It would be ungenerous to say that comparatively little benefit has been derived from the various attempts made to better the cattle industry during the last eight or nine years. It is, however, certain that many cattle raisers have been bewildered by the multitude of advice which has been tendered from time to time. For this reason, and also because we have already given as much space to the subject as the results would appear to warrant, we will reproduce but one more manifesto of the cattlemen. This was prepared and issued last year by one of the largest commission men in the country, and is so full of good advice that no apology is needed for reproducing it. "You may have spent all your life in the State of Texas," says the manifesto or circular to which we refer: "You may have been born and reared there in the cattle business; you may imagine that you understand the cattle business and cattle interest of your own State as well as any other man living; you may have been raised on the frontier of your own State; you may have spent nights astride your horse, riding around your herds in the darkness, and in the midst of roaring storms and the hissing of rattlesnakes; you may have lived for years on bacon, black coffee and hard bread; you may have seen your cattle roam over vast areas of territory, and mingle and mix with your neighbor's cattle; you may, perchance, have branded a few of your neighbor's calves, and, perhaps, he has branded some of yours; you may have lived in Texas in the days when there were no railroads or transportation facilities for your cattle; you may have driven fine herds of beef steers from the Lone Star State to the Northern market; you may have met the Northern trader on the frontier of the Indian Territory or Kansas and dickered with him for the sale of your beef steers at so many dollars a head; you may have received what you considered good prices, and what paid you a fair profit for the investment, the time and expense in producing your steers; you may have had your vast territories consumed by capitalists and corporations, and you may have narrowed your own holdings down to a small pasture, and have seen the boundless prairies, which were once covered with the virgin grass, eaten off into the ground by your starving herds; you may have seen what was once big, fat four and five-year-old beeves and rolling

fat cows and calves, dwindle into insignificant, small-boned, narrow, sway-backed, cat-hammed steers; you may, perhaps, too, have paid some good banker twelve or eighteen per cent interest for money to invest in a wire fence in which to put your cattle so that you could starve them to death.

"You, too, may have concluded that when you got your cattle fenced in with good barb-wire fences you could turn them over to your foreman and the cowboys, and live in town in a fine mansion and wear good clothes, like bankers and other people sometimes wear; you may have succeeded beyond your most sanguine expectations in running the ranch and making money, but all your experience in your own native State or the State of your adoption, whether you have been successful or unsuccessful, does not prove that you do not live in one of the grandest States in this Union, and an empire within itself. It is well-nigh impossible for cattlemen raised in the Northern States of this country to visit your State and not become enthusiastic over the grand possibilities that surround you in your own country. And with the finest climate of any State in the Union, and the greatest variety, richest, deepest and best soil, there is no reason why Texas does not possess all the necessary qualifications of a great country; and we are persuaded that but few of her present citizens realize the great possibilities that are around them in their own State and home. And as your State has always been a great range-cattle producer in former years, it is destined to become a great beef producer of fine-fed beeves; and with the finest climate in the world and the richest and best soil known to the inhabitants of this country, and the richest and best that the American flag floats over, there is no reason why, with the proper energy and the natural facilities that your country possesses, your State should not and will not become the foremost State in the Union as a producer of beef and pork, cotton and oats.

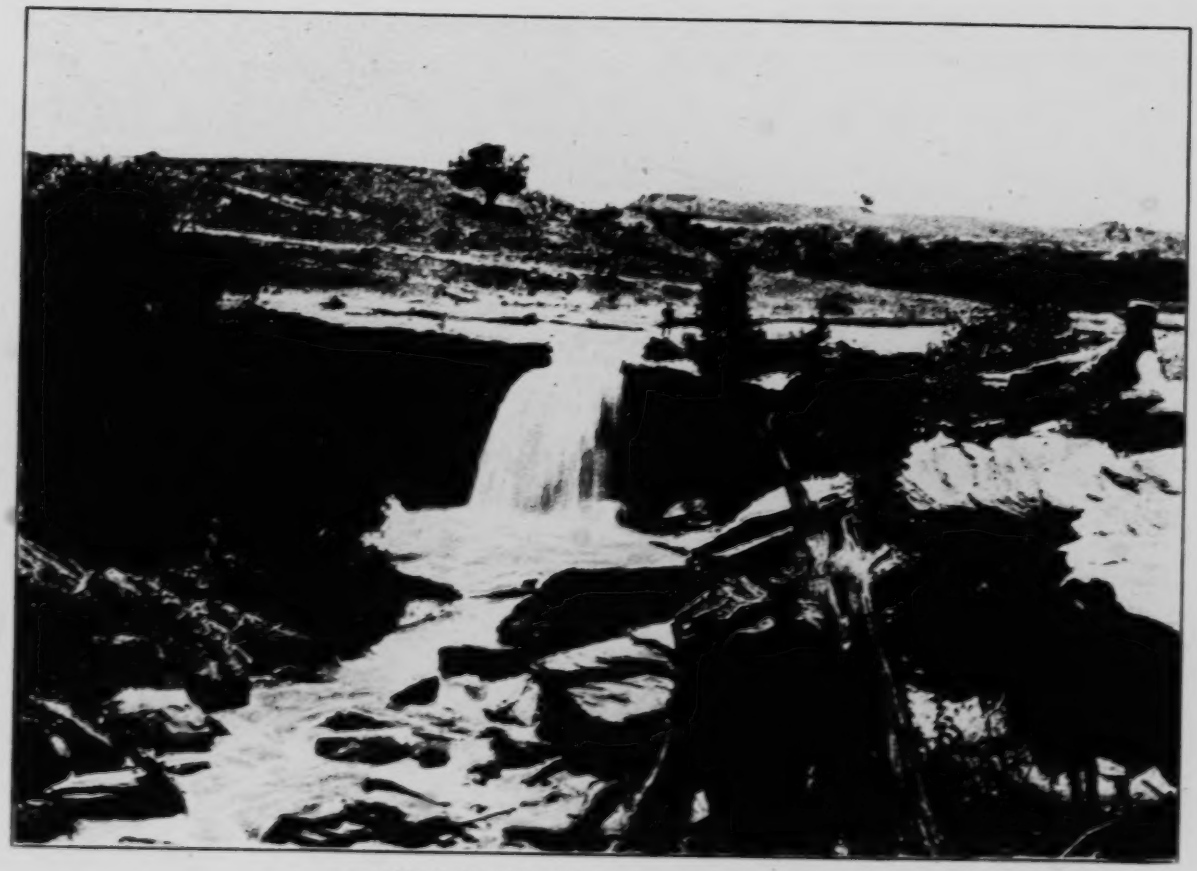
"If you have any feeding cattle on hand the present year (1894), and desire to feed your crop, the writer wants to suggest that the best cattle to feed at the present time and under the present circumstances, to get the best results, is to buy good, fat calves and yearlings, such as can be bought at any of the yards at from $2 to $2.25 or less, or from $7 to $10 per head. Such cattle can be fed for six months with a much better profit to the feeder, according to the amount of money invested in the animal and the feed consumed, than any other grade or kind of cattle at the present time. You should prepare your stock for market between the 15th of March and the 15th of June. This time of the year good, thrifty eight-hundred-pound steers always sell well, and almost as high as any other kind of cattle on the market. And the writer thinks that the pounds of beef on this class of stock can be made at less cost to the feeders than on old and larger cattle, as these young cattle grow rapidly and fatten fast, and consume less feed in proportion than older and larger cattle, and make more desirable beef animals for the market in the early spring months.

"It makes but little difference whether you buy heifer or steer cattle; either kind will fatten rapidly and grow fast, and be ready for market during the spring months. This class of stock can be carried through the winter, when properly sheltered and properly fed, to a much better advantage than larger and older cattle, and if you desire to make two feeds during the year, you had better feed your steer cattle on grass and shelled corn through the spring and summer months, as at the present prices feeding cattle costs, and the price of corn, if you undertake to feed a steer, say that costs thirty-five dollars, for six months, he will have consumed so much feed and corn that the probabilities are that he cannot be sold in the beef cattle market at a price that will justify or pay the feeder for his outlay or interest on the money and feed consumed. But if you commence feeding your steers in March or April, and feed them shelled corn, with plenty of roughness or good grass, you will make pounds much cheaper and much faster than you could by feeding through the fall and winter months on high-priced cattle. The trouble with most feeders at the present time, and which prevents them from making money, is that they let the cattle consume too much corn, and the corn is too valuable and worth too much money for the steer to ever pay back what he consumes when he is sold. And for this reason we advise our friends and customers with good steer cattle to feed them during the spring months, during the warm weather, where the cattle can have plenty of grass, and pounds can be made relatively much cheaper than during the fall and winter months on this class of stock."

There is no good reason existing in the minds of any well-informed handler of cattle why cattle should not be selling at this time for one or two dollars per hundred more than they are now bringing, except the financial condition of the country. At the beginning of the year 1893 cattle were active

and strong, and sold readily at profitable and satisfactory figures to owners, but with the advent of the panic beginning in April, prices of cattle, as well as that of every other product of the farm, declined to a point where it was absolutely impossible to produce without actual loss. With the rapidly increasing population, and a prospective decrease in receipts of cattle in the different market centers of the country, and a continual slaughter of cows, heifers and calves, and where it was shown by Government statistics that there is but a few more cattle in the country than there was a year ago, there is no other way to account for the low prices, except that manufacturers all over the country are not running or doing business, and that, in consequence, there is a larger number of idle men in the United States than ever before known, and the demoralization of finances in this country, and the fears of capitalists and bankers, and the uncertainty of tariff and other laws, have brought about and produced a stagnation in business, and while cattle, hogs and sheep have probably kept up and held their own as well as other commodities, and while owners and purchasers of stock have probably met their obligations more promptly than any other class of business men, yet the demand for our products is not what it should be nor what it should have been.

However, it is only reasonable to hope and expect better prices in the near future, the condition of the market in the spring of 1895 showing that it is only a question of time. With increased population, and when the wheels of our manufactories all over this country have commenced to turn, and our mines once more assume active operation—as they surely will in the near future—there is no question but that the products of the farm will again increase in price, possibly twenty to forty per cent above what they are at the present time, and on the whole, it is really encouraging for owners and shippers of cattle, hogs and sheep, and that as every dark cloud has a silver lining, so the cattle trade of the United States has a bright future for those who stay in the business and conduct it on an economical business basis.



DRIPPING SPRINGS FALLS PALO DURO CANYON, TEXAS

CHAPTER XI.

The Cowboy, as He Was, and Is, and is Supposed to Have Been.

IT is doubtful whether any human being in any age or generation has ever been so absurdly caricatured and misrepresented as the cowboy.

The writer of these chapters of history remembers an amusing scene witnessed by him at Arkansas City in the spring of 1889, which may be recounted here as an illustration of the difference between the cowboy as he is thought of in the East and as he really exists in the West and Southwest. It was on the eve of the opening of Oklahoma, and Arkansas City, like other border towns of Southern Kansas, was inundated with boomers, home-seekers, land-office lawyers, town-lot speculators, and that peculiar class of people which is always so freely represented on the occasion of the opening for settlement of public lands.

The Santa Fe train was coming in from the North and Northeast, and there were probably two thousand people in and around the depot. The train was of unusual length, and was crowded even to the platform step, with more than one "boomer," whose enthusiasm was greater than his pocketbook, stealing a ride on the trucks under the passenger cars. All sorts and conditions of men and women emerged from the train and set out in search of temporary lodgment, pending the wild rush which was to take place on the following Monday.

Among the last to leave the train were two individuals fearfully and wonderfully attired. To say that they were armed from top to toe, was to express the case mildly, for not only did each carry a Winchester rifle, but he was encumbered with a cartridge-belt and a revolver, the latter of no uncertain size or make. As to their general attire it may be said not even Solomon, in all his glory, was arrayed like one of these. The hats were white and each was about as large as a lady's parasol. To judge from the size of the boots the men might have been engaged in an effort to "corner" the leather market, and the dazzling appearance of each coat and vest cast Joseph's coat of many colors completely into the shade.

A large number of cowboys had come in from the Strip that afternoon, and various remarks passed among them as to who and what these extraordinary individuals could be. Some of the opinions which were passed around were the reverse of complimentary, and as the two heavily laden men dragged themselves and their accoutrements up the hill into the town they became the center of general observation, and the look of blank astonishment which overshadowed their countenances was amusing. Arriving at their hotel, their first procedure was to summon the bell-boy and send him out to purchase two ordinary-looking suits of clothes, two No. 7 hats and two pairs of shoes. The fit in no case was excellent, but when they entered the dining room a little later they were at least clothed and in their right minds, and approximately happy.

These gentlemen represented two New England publications and had been sent out to write up the scenes at the opening of Oklahoma. Not wishing to be taken for Eastern tenderfeet, and believing the stories as to cowboy manners and customs that had been told them, they had, at much trouble and expense, secured the outfits which, while they might have been very appropriate in Wild West shows, were absurdly out of place in every-day life. Everybody ought to know that the difference in the dress generally worn by dwellers in Eastern and Western cities is in matters of detail only, and that all stories of ridiculous attire are sensational and foolish. The gentlemen who had thus been imposed upon were the first to recognize their mistake, and when they left the land of the cowboys two weeks later they promised to do their best to correct the absurd misapprehensions which prevailed in the vicinity of their homes.

Nor is the estimate and idea of the cowboy's attire as found in the East much more erroneous than the opinion which prevails as to his disposition. Some cowboys like to be looked upon as dangerous

characters and bad men, but they are in the minority, and their bark is always worse than their bite. Mr. W. S. James, who was for twenty-seven years a cowboy, a maverick or a nester—the three names are practically synonymous—in his interesting work descriptive of his life on the plains, says, very aptly, that were it not for the fact that every genuine article is sure to have a counterfeit, the genuine cowboy would be ashamed to acknowledge his identity, so universally has the term "cowboy" been abused. "The cowboy," says Mr. James, "is confined to certain localities, and, consequently, is subject to impositions that seldom fall to the lot of other characters. This is largely due to the sensational stories written about him by people who, as a rule, know no more about life on a ranch than the hog knows about the solar system. The first evidence of a cowboy's counterfeiter so often seen is the small boy, as he leaps astride the broom-handle with an imaginary quirt and spur, with a leather band round his little cap and a twine string for a rope, and as he goes whooping across the room chasing the cat, a stick in the waistband of his pants for a pistol or knife, thus putting into practice the lesson he has learned and which will develop him by and by into the wild and woolly would-be-horned cowboy."

As Mr. James very fairly argues the point on behalf of his comrades, it is the custom, whenever a disturbance occurs in a Texan or Kansas town, to describe the noisy creatures as cowboys, whereas it frequently happens that the disturbers of the peace have never seen a ranch at all. Men of the caliber frequently spoken of as cowboys would find the atmosphere so torrid on a ranch, or in a camp, that they would not remain in it many minutes, even if they ever possessed the temerity to visit it all. As to the genuine cowboy, Mr. James' definition is so practical and so full of quiet humor, such as is frequently heard around the camp-fire or on the trail, as well as being so commendably brief, that we reproduce it in full.

"The title 'cowboy' is not intended to apply to all men who have taken an active part in handling cattle, but to those only who have proven themselves worthy the name of genuine, because of the nobility of character they possess; neither do I wish it understood that I am thus assuming that the genuine cowboy is altogether faultless. Even the genuine is human, and possessed of all the characteristics of frail, erring mortality. But one thing I do claim for him is, that in view of his peculiar surroundings, temptations, associations and privations, he is an exceptional character in that he is possessed of qualities both useful and ornamental in any station of life; but especially so with him, isolated as he has formerly been from the refining influences of civilization. In reality the cowboy might properly be divided into three classes. First, No. 1, the genuine, because of his true manhood, and not only in his relationship to those with whom he is daily associated in handling cattle, but with all the world. One who has as much respect for the rights, though he be miles away, as for his immediate neighbors. I mean by that a man who is strictly honest, one whom it does not affect in his general health to eat a piece of an animal of his own mark and brand. Still, one who is not so Pharisaical as to 'thank God, he is not as other men,' but can throw the mantle of charity sufficiently far as to reach his less scrupulous brother; and one who will look to the interest of his neighbor, when on a round-up, as he does his own, no difference what the reputation of that neighbor may be. One who is the happy possessor of the combined characteristics of a true gentleman, a loyal citizen and an all-round business man, with the 'get-up-and-get' of a cowboy.

"No. *2* is worth consideration. He is the true type of Western hospitality, liberal to a fault, especially in his moral views; so much so that his conscience is possessed of such elasticity as to serve him in any emergency. Like the proverbial Irishman, who, upon finding a U. S. blanket, called out: 'U for Patrick and ..or McCarthy. Och, but I'm glad I found me blanket. Me father told me that edecation was a good thing, and now I know it; but for an edecation I never would have found me blanket.' So it was with No. *2*; he is peculiarly fortunate in his education. It often assists him in his interpretation of the brands of cattle from the Northern range, and enables him to appropriate the same. He is thus financially reimbursed for his losses during winter's driving storms; he is, however, peculiarly constituted when it comes to eating an animal encumbered with his own mark and brand. It is almost a dead shot. If by any misfortune while he is in a distant range some enterprising No. *2* should feed him on some of his own beef, it acts like ipecac. In his own language, 'It shore makes him sick,' so I have heard them say; and such a thing as eating their own is so rare, if they should find it out it

seems not unlikely that the thought of such would cause a reaction in the physical man. It never proves fatal, however, as it is part of his existence to get even.

"No. 3 is the roaming, 'come day, go day, God send Sunday, good-natured, easy-going cowboy,' who is just as happy where he is as where he is not; who cares for nothing but a good saddle, spurs and quirt and a forty-dollar job; who seldom aspires to accumulate for himself, but is satisfied to spend his life in working for some one else, and when the season for working cattle is over repairs to the nearest town and spends what he has earned in having a good time. No. *2* manipulates this latter class in many ways; they, as a rule, will do for him what they would fear to do for themselves, and too often it is the case that No. *2*, when in too close a place, in order to save himself, will slip the head of some pliable dupe into the halter that justice has designed for his own. Don't understand by this that I mean to intimate that No. *2* is a thief. No, indeed; if any one should accuse him of such conduct it wouldn't even ruffle his feelings, as he lives daily in the consciousness that everything he does is on the dead square. No. *2* is simply a 'rustler' from 'way back, and when it comes to a round-up, he's there.

A BUNCH OF WELL-KNOWN COWMEN.

"I have given the shady side of character No. *2*, and I am glad to give you his virtues, and don't wish you to think that I am partial in what I shall say of the sunny side of his life. No. 1 needs no coloring or apology, as his life is a living index to his character; No. *2* needs the mantle of charity very extensively thrown around his wayward shoulders, and it is but just when we consider his environments, the peculiar circumstances under which he has been trained, it is but charity to give him credit for the good in his nature. No. *2*, with some exceptions, is a neighbor to be proud of; he has nothing too good to divide; you know when you enter his home that you are welcome. There is an air of freedom that one can feel sensibly pervading the home of No. *2* that inaudibly, but positively, breathes a hearty welcome. You needn't expect him to neglect any of his duties to entertain you, for he will not, but you have the freedom of the place, let it be large or small.

"He will ride twenty miles on a rainy night to bring the doctor for a sick neighbor, or go to the relief of a distressed human being, no difference what his character. All he needs to know is, that they are suffering. If any of his associates, those with whom he 'stands in,' should be so far misunderstood

as to get arrested, he will go to his rescue, and, as a rule, is able to make satisfactory explanation and secure a verdict. This especially applies to dates back of '87. It is now getting to a point, and has been for several years, that jurists and judges are getting so incredulous that the boys have been having considerable trouble to explain their mistakes, and the consequence is that many of them have been sent East to work under the supervision of the State; this is invariably done under protest, and nearly every one who takes a State contract is innocent; and if you don't believe it, you may be convinced by going to Rusk, Tex., and ask them or refer to the court records, and almost without exception, you will find a plea of 'not guilty.' A genuine No. 2 never goes back on a friend.

"If some unfortunate should come to him in distress, one who is in danger of being 'pulled' for 'pulling,' he will 'rustle' up the best stray horse in the range, and borrow a saddle from a sheep man, provided the 'snoozer' is away, and filling him up on good grub, will give him some of his spare cash and let him 'lean forward and shove,' after giving him some meeting-house advice, which, as a matter of course, he takes. No. 2 will guard the interests of his neighbors in the cattle business, and also his stand-bys with jealous care. When he finds cattle in a distant ranch belonging to neighbors, even though it is a poor neighbor, he will drive them for him; and even a nester, if he is a straight man, receives the careful consideration of No. 2, often having the free use of milch cows the year round. In fact, if No. 2 allows him to milk them at all, it is free, the only consideration being that the calves are cared for and not knocked on the head with a churn dasher, to prevent which, he usually requires the nester to milk half a dozen or more.

"No. 3, on the other hand, sometimes by close application to business, especially if he is a live and energetic rustler, will accumulate sufficient property to take his place in the rank of ranchmen. Those who did not accumulate and start in cattle, eventually married, and either settled down to engage in grangering, become nesters or take a contract from the State.

There are other characters in the cattle business, but the three classes mentioned include the principal actors in active cattle raising. The cowboy is a big-hearted, whole-souled bundle of humanity, kind-hearted, generous to a fault, possessed of all the frailties common to mankind, and not the biggest rascal on earth by a jug-full."

Mr. McCoy's description of the typical cowboy and his life was written years prior to the very eloquent, and almost touching, defense just quoted. The pioneer shipper of Western cattle has this to say of the cowboy of the sixties and seventies:

"If any one imagines that the life of a cowboy or ranchman is one of ease and luxury, or his diet a feast of fat things, a brief trial will dispel the illusion, as is mist by the sunshine. True, his life is one of more or less excitement and adventure, and much of it is spent in the saddle, yet it is a hard life and his daily fare will never give you the gout. Corn bread, mast-fed bacon and coffee constitute nine-tenths of their diet; occasionally they have fresh beef, and less often they have vegetables of any description. They do their own cooking in the rudest and fewest possible vessels, often not having a single plate or knife and fork other than their pocket-knife, but gather around the camp kettle in true Indian style, and, with a piece of bread in one hand, proceed to fish up a piece of 'sow belly' and dine sumptuously, not forgetting to stow away one or more quarts of the strongest coffee imaginable, without sugar or cream. Indeed, you would hesitate, if judging it from appearance, whether to call it coffee or ink. Of all the vegetables, onions or potatoes are the most desired and the oftenest used, when anything more than the 'old regulation' is had. Instead of an oven, fire-place or cooking stove, a rude hole is dug in the ground and the fire made therein, and the coffee-pot, the camp kettle and the skillet are the only culinary articles used. The life of the cowboy is one of considerable daily danger and excitement. It is hard and full of exposure, but is wild and free, and the young man who has long been a cowboy has but little taste for any other occupation. He lives hard, works hard, has but few comforts and fewer necessities. He has but little, if any, taste for reading. He enjoys a coarse, practical joke, or a smutty story; loves danger, but abhors labor of the common kind; never tires of riding, never wants to walk, no matter how short the distance he desires to go. He would rather fight with pistols than pray; loves tobacco, liquor and women better than any other trinity. His life borders nearly upon that of an Indian. If he reads anything, it is in most cases a blood-and-thunder story of the sensational style. He enjoys his pipe, and relishes a practical joke on his comrades, or a

tale where abounds animal propensity. His clothes are few and substantial, scarce in number, and often of the gaudy pattern. The 'sombrero' and large spurs are inevitable accompaniments. Every house that has the appearance of lack of convenience and comfort, but the most rude and primitive modes of life, seem to be satisfactory to the cowboy. His wages range from fifteen dollars and twenty dollars a month in specie. Mexicans can be employed for about twelve dollars per month. The cowboy has few wants and fewer necessities, the principal one being a full supply of tobacco.

"We will here say for the benefit of our Northern readers that the term 'ranch' is used in the Southwest instead of 'farm,' the ordinary laborer is termed a 'cowboy,' the horse used a 'cowhorse' and the herd of horses a 'cavvie yard.' The fame of Texas as a stock-growing country went abroad in the land, and soon after her admission to the Union unto her was turned the eyes of many young men born and reared in the older Southern States, who were poor in this world's goods, but were ambitious to make for themselves a home and a fortune. Many of this class went to Texas, then a new and comparatively thin and unsettled country, and began in humblest manner, perhaps for nominal wages, to lay the foundation for future wealth and success."

Read side by side, these two little essays on the genus cowboy teach a lesson in the process of evolution which has been so marked in every section of the live-stock interest of Texas and the Southwest. Mr. McCoy is a little unnecessarily severe on the cowboy. We doubt very much whether this gentleman, for the cowboy may be, and generally is, a gentleman, was quite such a rough-and-tumble, uncouth individual, even thirty years ago, as the justly respected pioneer cattleman would have us believe. That the desire among cowboys for reading is very limited is not true at the present time, because there are on the Texas plains an immense number of well-educated men engaged in the cattle business. It is no doubt that during the war an exceedingly unsatisfactory class of individuals went out on the plains for the purpose nominally of herding, but actually of stealing and generally making things unpleasant for all with whom they came in contact. There may have been among these a large number who enjoyed costly practical jokes and objectionable stories, who abhorred hard labor of the common kind, and loved tobacco, liquor and women better than any other trinity. There may have been some among them who enjoyed a corrupt tale where abounded much vulgarity, and there doubtless were several whose clothes were coarse and gaudy.

But Mr. McCoy falls into the error of allowing the sins of the few to rest upon the shoulders of the many. Many men who to-day are prominent in the cattle trade were cowboys in one sense of the term, and none of these ever came within the definition so abruptly and severely applied. Mr. McCoy's cattle book is one of the first which was ever published concerning the trade, and, generally speaking, it is taken as a classic. This being so, it is the more to be regretted that in writing up the cowboy he dwelled so extensively and seriously upon the bad features of the few, without softening his criticism by an equally fair statement concerning the virtues of the many.

Mr. James handles the subject very differently. A writer is, to a great extent, a recorder of public sentiment. If he is successful it is because his writings are, more or less, a mirror faithfully depicting current thought as well as current events. Hence it is the description of a cowboy printed in 1893 is so much more reasonable than the definition placed on record twenty years previously. There has been an immense improvement in the morals and the personnel of the average cowboy during the last quarter of the century; and even if Mr. James writes from a prejudiced standpoint, and hence brings to the front the nobler side of the cowboy's character with possibly undue force, he does not overstate the case when he claims for him that, "in view of his peculiar surroundings, temptations, associations and privations, he is of an exceptional character, in that he is possessed of qualities both useful and ornamental in any station of life; but especially so with him, isolated as he has formerly been from the refining influences of civilization." Certain it is that the description of Mr. James fits the cowboy of the last ten years of the nineteenth century far better than the description which, we hope, was scarcely accurate when written, and which certainly does not apply in any way to ninety-nine per cent of those now engaged in raising and feeding stock.

One thing is certain about the fin-de-siecle cowboy. He is undoubtedly the good Samaritan in the parable which was designed to hold up for commendation the most noble attribute of human nature. A Pharisee the true cowboy never is. If, perchance, a man imbued with the holier-than-thou idea

wanders into Texas, and attempts to earn a living on a ranch, things are made so unpleasant for him, and so many practical jokes are played upon his person and his belongings, that he loses no time in shaking the dust of the great cattle State, and returning in haste to the place wherefrom he started.

But the cowboy is more than a good Samaritan. We do not read in the Bible that, in relieving the sufferings of the man who had fallen among thieves, the Samaritan parted with anything in which he was not actually in need. The cowboy is not only generous when generosity costs him nothing, but he is generous when generosity involves actual personal hardship. Instances can be recorded, time without number, of cowboys who, while engaged in their arduous work, have parted with common necessities of life, and suffered great privations in order to let a weaker brother have a little more luxury. Life on the plains of old, and even on the ranch of to-day, has little place in it for sick people, but the cowboy who is hurt while at his work, or who falls sick, finds out for the first time the true extent of his circle of friends. Men who may have joked and teased him while he was well, and even been jealous of his superior horsemanship, or of his ability to attract the attention of the fairest members of the fairest sex, vie with each other in their efforts to relieve his sufferings and provide for his needs. When a cowboy "hands in his checks," to use an expression often heard in the Southwest, there is more grief among the apparently hardened survivors than is often found in the most civilized State.

One little incident illustrative of this noble feature so conspicuous in the cowboy may be given. For obvious reasons names are omitted. The story was told the writer by a gentleman who has been connected with the cattle trade since he first toddled after his father, who was a cattleman ten years before the war broke out. There had been a stampede of cattle during the night, not a very unusual or remarkable occurrence, but this time it resulted fatally to an exceptionally bold and, indeed, reckless rider, who had tried to turn the leaders from their course and convert the wild rush into a galop around a circle. The scene, as described by an eye-witness, was a thrilling one in the extreme. The herd first commenced drifting rapidly before a norther, which became greater in strength and force every second. Suddenly it began to rain very heavily, and a magnificent, though awful, thunder storm succeeded, the lightning being vivid in the extreme and the thunder deafening in tone and volume.

There was no doubt now as to what would happen. The cattle lost their heads and commenced to stampede in the wildest manner. A dozen expert riders, in whose vocabulary there was no such word as fear, made an effort to turn the herd. The easiest and safest course for them to have adopted would naturally have been to keep out of the way of the cattle, and let them go where they would; but duty suggested another course, and the ordinary though perilous task of turning the herd commenced. To get in front of stampeding cattle is merely to court instant death, and all that can be done is to ride by the side of the leaders and endeavor to divert them from the straight line which in their frenzy they have adopted. In this particular case the task was unusually difficult, owing to the roughness of the ground and the wildness of the cattle, many of which had only been added to the herd a few days before. One man, in his effort to protect his employers' interests, met with a not unusual, though fortunately a less frequent fate than was at one time the case. His pony cannoned heavily with a wild steer and fell. Its rider, who had been astride a thrown pony a score of times, sprang safely from the back of his falling steed, and was in no danger from this immediate accident; but before he could recover himself he was knocked down, trampled under foot, and left behind the stampede a broken and bruised mass of human flesh and bones. By one of those uncertainties of fate which mankind cannot explain, the immediate death which his companions felt was the inevitable did not ensue, and a few hours later the dying man was lying on a small couch in a friendly shanty. His condition was hopeless, and all that was to be done was to make his few remaining moments of life as comfortable as possible. Suddenly consciousness returned to the sufferer, who, raising his voice as much as his strength would permit, said to the ten or twelve members of the much-maligned profession of Texas cowboy who were standing around him:

"Boys, which of you will take care of my children?"

Not one of the crowd knew that their comrade was a man of family, but every hand was raised instantly, and with a smile the injured man passed out of existence, conscious at the last moment of his life that the promise made by his comrades would be faithfully performed and fulfilled to the letter.

The sequel of this story is, that as soon as the family of the dead man could be located, the boys who had given the pledge made arrangements to provide for the education of the two little children who survived their cowboy father. Others, hearing of the circumstance, insisted on being allowed to help, and the children in consequence received an excellent education, and have quite recently been given a first-class start in life.

This anecdote is given here as a prelude to an attempt to show that whatever peculiarities the cowboy may have, he is at heart a splendid fellow, and that his word is better than the bond of the average man who looks upon him with contempt, and who often speaks of him in terms of ridicule and ill-concealed scorn.

AN OUTFIT

Speaking of the peculiarities of the cowboy, one naturally refers to his clothing, and more especially to his hat, boots, saddle and bridle. We have already spoken of the exaggerated idea in some portions of the East as to the style of clothing in those sections of the country where cattle raising is an important industry. A very large number of cowboys at the present time dress just about as they please, wearing as little as possible in summer and wrapping up very indifferently in winter. In years gone by the fashions as to cowboy clothing were undoubtedly very arbitrary. Before the war there was a great variety in the outfit, and there was some excuse for speaking of the cowboy as a walking arsenal, because his frequent interchange of civilities with the "noble red men," and with wolves and other animals, made it necessary for him to go about very freely armed. It was during the war, or shortly after its close, that the first general attempt at anything like uniformity was observed.

Money was not very plentiful in those days anywhere, and especially on the plains, and hence it took a good many months' savings to get in the fashion. A very narrow stirrup was affected at that period and the toe-fender first came into use. The substantial Mexican saddle, which has since become so popular, was then quite a rarity. There were some very large and good saddles, but the majority of them were sadly lacking in requirements for the comfort and safety of the rider. The very costly and elaborate bridle of to-day was then unknown, and in its place were strips of rawhide, tanned as well as could be, arranged without the usual facilities for a scientific manufacture of leather. Home-made clothing was the rule at this period. Instead of the characteristic hat of to-day, home-made straw was generally favored; and, in order to protect the clothing from the tremendous wear and tear of constant life in the saddle, leggings of calf-skin, with the hair on the outside, were made by those members of the fraternity who had time and patience to devote to the work. Speaking of this period, Mr. W. S. James says that some men broke the monotony by making their bridles out of hair on the Mexican plan, while others plaited thin strips of rawhide and used them for the purpose. The ropes used for catching and handling cattle were mostly plaited rawhide of this character; and it is the opinion of a good many modern cattlemen that the ropes thus made have never been equaled in pliability and strength.

In the seventies there was a general change in style. The wool hat came into use and was found so infinitely preferable to a straw, that not to wear one was to be away behind the times. Leather leggings and handsome bridles also came to the front, and, what was more important, the old narrow stirrup, in which a man could do a little more than thrust his toes, gave way to a wide stirrup very much like the one now in use, although it was sometimes an inch or two broader. It is strange to say that at this period what is known as the English style of riding began to be popular. Instead of riding in what is now known as the conventional cowboy style, with the knees straight, the stirrup leathers were shortened four or five inches, and even more, so that the plan of riding with the legs cramped and the knees always bent became general. A flat horned saddle, much broader than formerly, also came into use. The saddle pocket of gaudy pattern was another invention, and another difference in style was a saddle high up in the neighborhood of the horn and very low in the rear, so much so that the tenderfoot invariably slipped off the hind end the moment he tried his horsemanship on the back of a cow pony. Long buckskin gloves and gauntlets, passing up above the elbow, also became fashionable. Larger stirrups, fitted with bows and tassels, also came into use, and the cowboy became quite picturesque as well as conspicuous individually.

Again did the fashion change. Heavier-made, square-toed boots came into use, and the very heavy saddle, still popular, came into prominence. During the last ten or twelve years exaggeration has been largely abandoned, and although the cowboy's dress is still attractive and a little peculiar, it is not a little conspicuous or gaudy, whatever may be said to the contrary. Nor does he now think it necessary to wear a number of pistols or knives in his belt, and otherwise proclaim to the world that while he is not exactly hunting trouble, he is quite prepared to be strictly in it if any one treads on the tail of his coat.

It is often said that the cowboy is cruel. Some portions of his work necessitate a good deal of roughness, but at heart he is as merciful as the average human being, and often more so. To break in a pony by kind words is excellent in theory, but when a cowboy finds himself on a balky animal ready, willing and able to throw and injure him, it is, to use the words of President Cleveland, "a condition and not a theory which confronts him." The plucky little pony has to be taught once and for all who has got the final say-so in the matter, and, to the credit of the average pony's intelligence be it said, this lesson seldom has to be taught twice. When once an understanding has been come to between rider and steed a genuine friendship is struck up, and the rights of the pony are protected by its owner as zealously and, indeed, jealously as his own.

Next to his love for his pony, it is possible that the cowboy loves his saddle and bridle best. Cases are on record of men who have deprived themselves of little luxuries in the way of tobacco, etc., for several years or, at any rate, months, in order to secure a saddle and bridle worth as much as its owner could earn in six months. These saddles and bridles, and also bits, are kept in a condition of

elegance which would shame the best educated and trained army in any Eastern city; and a man who spoils or injures one of these personal belongings, generally has considerable reason for regretting the fact.

The cowboy also has a tendency to collect a first-class outfit of ropes. Some men have eight or ten first-class hopples always on hand, and those they protect with an amount of care that can hardly be imagined unless a man is on the ground to watch the cattle events of prairies and ranch life. The old joke about the cowboy with a two-dollar suit and an eighteen-dollar hat has been repeated again and again, but although it may be a little overdrawn, it covers the point to a certain extent. Instances are not uncommon of cowboys whose clothing would scarcely be purchased for a few cents by a second-hand dealer, but whose hats, saddles, bridles and spurs are as nearly perfect as money could procure. Mr. James estimates that the average hat worn by the fashionable worker on a ranch costs him between five and ten dollars. His clothing he estimates at about the same, and also points out that extravagance and an absolute inability to save a dollar as one of the natural results of life on the open prairie.

Under these conditions it is interesting to observe that there is very little money to be made in tending cattle. Things of course are a great deal better than they were in Mr. McCoy's time, but the wages paid for ranch work may be fairly estimated as varying between fifteen and seventy-five dollars a month, with a good many more receiving the minimum than the maximum. When it is remembered that a first-class saddle costs about one hundred dollars, and that a good many men spend as much as twenty-five dollars for silver medals on their hats, it is not difficult to realize that nothing is saved in many instances after ten or twenty years' work of this character. Of course, there are countless exceptions to the rule. Some cowboys are allowed to own a few cattle which run with those of their employers, and in this way many a foundation has been laid for successful and very prosperous ranch work.

It is often asked why it is that cowboy life has so many attractions. No one who knows anything about the boys believes that it is a life of luxury, and we can easily see from the figures quoted above, that there is very little money in it. The absence of comfort in the life can scarcely be overestimated, and it is probably the by-play and practical joke phase which commends it to so many. Almost every day something transpires to make a diversion possible from the stern realities of life. The appearance of a stranger in camp is almost always an excuse for a little fun, and although the jokes are often carried too far, they are seldom very serious in nature. A trick, which never seems to lose the force of its interest by age, is to persuade a new hand to mount an unruly horse. The circus which follows casts into shade the best tricks ever seen in a tented ring. Sometimes the stranger shows an ability to retain his seat under difficulties, and then the delight of the cowboys know no bounds. The joke is turned against them for a moment, but they enjoy it none the less, and the man who has thus proved his horsemanship ability is admitted into good-fellowship without more ado.

The jokes that have been sometimes carried to considerable length is shown by some of the stories which every one hears while in Texas. At a comparative recent date, a young man from the East, who had determined to become a cowboy, sought employment on a large ranch in the southwestern portion of the State. He was dressed something like the two journalists referred to in the opening page of this chapter, and when he reached the camp his extraordinary garb caused the boys a good deal of amusement. By common consent it was decided to humor the new-comer. He was greeted with fervor, and before he had been in the camp a half hour his head had been swelled several sizes by the assurances he had received that he was just the kind of man they had been looking for. Such portions of his outfit as pleased the fancy of the boys, as they crowded around the new-comer and listened with well-simulated admiration to the ridiculous stories which he told them with great delight, were appropriated or borrowed.

Finally, one member of the party, a habitual practical joker, who never hesitated to carry into execution any desperate idea which commended itself to him, left the circle and disappeared. About an hour later he arrived with a deputy sheriff, who promptly arrested the would-be bad man from the East. The young man, who had been doing his best for two hours to persuade his newly-found companions that he had killed men several times, and that he had been guilty of almost every offense against the law of the land, fell on his knees at once, and assured the deputy sheriff that he had done

nothing and his arrest was a mistake. The practical joker had informed the deputy sheriff that the new-comer was a member of a gang of train robbers, for whose apprehension a liberal reward was offered. The deputy sheriff told the would-be cowboy to get up and shut up, and he was dragged away under arrest and held to answer a charge of which he was as guiltless as an infant in long clothes. Of course, the mistake was discovered almost immediately, and the young man was set at liberty, but he had had enough of Texas life on the plains, and returned home a wiser man to his friends. Just what was his explanation of his speedy return is not known, but he must have found it very difficult to reconcile results with anticipations as previously announced.

It is often said that cowboys put in a great deal of their time riding through peaceful towns and settlements, firing their six-shooters right and left, and driving people into a condition of collapse from fright. This is one of the misapprehensions of the age. In border and mushroom-grown towns there is always more or less lawlessness, and, occasionally, cowboys partake in exuberations of excitement, and have what is called a good time in rather a bad way. The court and police records of cattle States and Territories show, however, that the percentage of cowboys among criminals and even lawbreakers is very small indeed. A cattle thief is not a cowboy, and the greatest possible injustice is committed when the two types of men are confounded; nor is the man who recklessly fires his revolver into a crowd or a train necessarily connected with the cattle trade, even though he lives in a district where a large number of steers are fed.

"I never knew but one outfit in Texas," says Mr. James, "that would have hired or kept a man on a ranch who would fire into a train. I don't believe that one out of every five hundred of the cowboys who have figured in cattle in Texas would do such a thing. They have more personal respect, and, as a rule, they have too much respect for women to do anything that would frighten them or endanger their precious lives. The cowboy is a bundle of fun, but pure, unadulterated cussedness is not one of the ingredients in his composition. He is rollicky, but not mean. You may say what you please about your Eastern civilization, and I grant in some localities you are far in advance of Texas in some things. But, remember, I am now talking of the cowboy, and I have witnessed things in some of your Eastern cities and towns that I never saw, and that would never occur, in any Western town in Texas. I mean incivilities to ladies, or what I, with my unvarnished ideas, would call uncivil treatment."

The same writer gives an interesting description of the peculiar slang expresssions which are current on the ranch. Mr. James very properly points out some very popular preachers who are very free in their use of slang expressions, so that if occasionaly the cattleman deviates from pure Lindley Murray, it is not very surprising. He recounts the fact, which is generally known, that if a cowboy swears in the presence of a lady, he is certain to be handled very roughly in the way of punishment, or, if he is not, he is sure to be very roundly cursed for allowing himself to fail in breach of good manners.

"Something seldom," is a very common slang expression in Texas, and Mr. James explains how this came to be adopted. "A number of the boys," he writes, "were one day standing on the corner of a street in a Western town, when a little black dog came trotting across the public square. They were making some very unkind remarks about the dog, as he had no tail and his ears were cut off. An old drunken fellow, standing holding to a sign-post, took in the situation and, in his half-drunken, foolish way, said: 'Something seldom about that little black pup.' This created quite a deal of mirth; the boys took it up from that, and to-day there is not an expression more universally in use in the West among the boys than this one, 'Something seldom,' and the variety of uses to which this expression is subject is something curious. For instance, if one sees a very fat horse, 'there is something seldom about that fat horse'; if very poor, 'there is something seldom about him'; if very large or small, it is the same. If a young lady is handsome, 'something seldom about that girl'; if very homely, still 'something seldom.' It is applied to tall people, short people, fat people, thin people, good horses, bad horses, one-eyed people, cross-eyed people, fast horses, fine cattle, scrubby cattle, good preachers, bad preachers—anything and anybody under any and all circumstances conceivable; there is 'something seldom' about them."

Many of the slang expressions are simply a result of regarding a man, for the time being, as one of the herd. Hence, when a man is out of sorts, it is sometimes said that he looks so bad that his ears

flop. "I've got your company," is a common way of acquiescing to a proposition, and there are dozens of other similar expressions which, if space permitted, might be given. Repartee is common. One instance is recorded of a man who went into a camp limping badly, and complaining that he had been bitten by a snake. Snake bites are comparatively common among herders of cattle, and the wag of the camp asked, mechanically: "Did it hurt the snake?" Every one laughed, and the victim of both bite and joke hopped off to prevent subsequent injuries by means of a liberal dose of that specific for snake bites in the West and Southwest—whisky.

Mr. James, who appears to have studied cowboy life more closely than any other writer, tells another story about a cowboy named Joe, who once purchased an exceptionally handsome silver-plated pipe. Everything is common property on a ranch. Full-dress suits are not in vogue, but if a cowboy receives an invitation to a hop, and he has no clothing suitable for the occasion, he generally goes through the wardrobes of his companions and takes the nearest thing he can find to a full-dress outfit from among them. If he thinks about it he will return the articles the following day, but generally speaking, they lie around until the owner comes after them.

On this particular occasion, Joe, on returning to camp with his purchase, told the boys that the pipe was for him, and that if any one was caught with it, the individual who is supposed to have charge of the lower regions would have to pay in consequence. For awhile the dictum of the pipe owner was respected, but one day the orders were disregarded and a member of the camp not only smoked from the pipe, but also put it in his pocket in order to be able to repeat the process later on. The next morning the pipe borrower found, to his astonishment, that his pony was missing, and he had to go to work on a very unsatisfactory animal, which had been laid to one side on account of its lack of speed and general meanness. One fine morning he was smoking the appropriated pipe and talking about the horse, when one of the crowd looked up and asked if that wasn't Joe's pipe. The man said that it was, whereupon his questioner told him that it was about twenty to one that Joe knew where the horse was. The hint was taken, the pipe restored to its owner, and sure enough within an hour the pony was back in its usual quarters.

But it must not be supposed that even a large percentage of the time on the ranch is spent in the perpetration of jokes and having a good time. The routine of a cowboy's life to-day is monotonous compared to what it was in the free-range days, when the scope of his operations varied materially. Mr. McCoy, whom we have already quoted as a little severe in his criticism of cowboys, gives a description of one of his duties which shows that at the time that gentleman wrote his criticisms the time at the disposal of the cowboy for fun was very limited. An account is given of the steps taken by a drover who had arranged to collect a large number of cattle and drive them to the North. When the drover had completed his contracts, he purchased the necessary saddle horses, got up what was called a cavvie yard, a wagon for hauling camp supplies, the requisite number of cowboys for driving, and further facilities for providing for them on the road.

"When the day for receiving his purchases arrives," writes Mr. McCoy, "the drover, with his outfit of hands and camp equipage, puts in an appearance at the designated place, and all such cattle as will fill the contract are received; and often many that do not fill the contract are taken, simply because a custom has obtained to take almost everything the ranchman has gathered, and a drover who will not do so is termed very particular and liberal—a reputation that they abhor—so, thus often the drover is pulled into taking animals that he never bought and that his business sense tells him he should not take. And this is the reason, more than anything else, why so few really select droves of Texan cattle reach the Western market. It is no lack of judgment, but because it is the custom to take almost anything that is gathered by the ranchman. Again, these contracts are usually verbal only; and to be particular, would lead to wrangles and differences of memory and understanding, which are not pleasant to the drover. The ranchman is gathering the stock to fill his contract, drives together, or, in drover parlance, 'rounds up,' a large number of cattle of all ages and sexes, and while from six to ten cowboys hold the herd together the ranchman, with one or two assistants, separate such as are suitable. The process is termed 'cutting out.'

"The process of 'cutting out' is one that requires skill and expert horsemanship, both of which the experienced cowboy invariably possesses in a high degree, especially the latter, for, indeed, it is a

desperately bad cow pony that he can not ride. This reputation of Texas for horsemanship is national, and needs no eulogiums in this place. To accomplish the greatest amount of labor with the least effort and the least amount of hard riding, two cowboys work together. When a beef is selected to be 'cut out' he is adroitly and quietly maneuvered to the outskirts of the round-up, and when the opportune moment occurs the cowboys dash at him, and, before he is aware of it, is on the outside of and separated from the herd; but no sooner does he discover the situation than he makes a desperate effort to regain his comrades, and just here is where the skill of the cowboy is put in requisition. While one rides beside the steer the other rides just behind him, to prevent or check any sudden change of direction that the frantically excited bovine may chose to make in his efforts to get back with the herd, which he tries desperately to do, and persists in trying so long as there is a shadow of a chance to outrun his pursuers. Often the race is close and the contest exciting, and sometimes the outer circle of the round-up will be run more than once before the beef will be induced to abandon the effort to get into the herd.

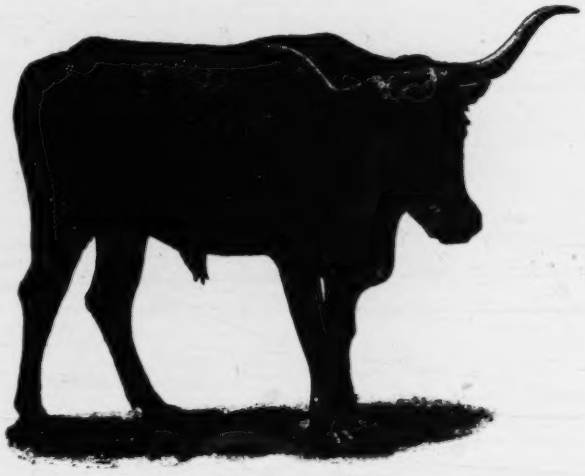
"But when he finds himself outrun and outgeneraled, he will toss up his head and look for the comrades which have been previously cut out, and are being held a few hundred feet distant. In the beginning of the cut-out, a few gentle cows or working oxen are driven a short space from the round-up and held, to form a nucleus, to which those cut-out gather. Cutting-out is always done on an open, smooth spot of prairie, and never done inside a corral, as a Northern man handles or separates his cattle. When North with their herds, a Texas drover always prefers the prairie to any inclosure to handle his stock, for there, mounted on his pony, he feels at home and knows just how to manage; besides, he has a fixed, constitutional prejudice against doing anything on foot that can possibly be done on horseback, not to speak of the almost universal fear they entertain of being among their stock on foot. They are justified, to some extent at least, in indulging this wholesome fear; for but few Texan bullocks will hesitate, when enclosed alone in a strong corral, to show decided belligerent proclivities, or to furiously charge the venturesome wight who dares to show himself on foot within the enclosure. Occasionally, whilst loading a herd upon cars, a bullock will become detached from his comrades, and almost invariably, as soon as he finds himself alone, without ability to escape, will manifest a disposition to fight anything or anybody that may chance to be in sight. Often considerable difficulty is experienced in getting him to any desired place. A Northern man, unaccustomed to handling Texas cattle, will often rush into the corral wherein is a single bullock. He will have scarcely got cleverly in the corral before the bullock, with arched back, down-set head, extended nostrils and glaring, fiery eyes, darts toward his supposed adversary, who, suddenly taking in his dangerous situation, but too late to retreat by the way of his entree, rushes post haste to the nearest fence, which is usually so high he cannot spring to the top of it; but reaching the top with only his finger tips, draws his body as high as possible, and clinging to his hold with frantic grip, yells lustily for help."

An immense number of descriptions of camp life and scenes at a modern round-up have been published from time by tourists and amateurs. One of the best of these was written by a well-known New York man for "FRANK LESLIE'S MAGAZINE" about three years ago. This description is so vivid that we reproduce a portion of it in the writer's own words. After explaining that he had arrived the night before with his friend, the owner of the ranch, and had hence not seen the surroundings in daylight, he describes his sensations when, at about three o'clock in the morning, he was suddenly aroused from very pleasant dreams by a furious banging on a tin pan, and a shout of "breakfast." It was but 3:30, and only the faintest glimmerings over the high, white bluffs on the opposite side of the river, showed where the sun would rise by the time the bustling camp had breakfasted and was ready to begin the long day's work. Right in front, next the river, was the huge camp-fire of logs on which the breakfast for thirty-five men was smoking, and the men themselves, the cowboys about whom he had been dreaming for months, were either warming and stretching themselves around it, or taking a hasty bath in the stream.

Just at this moment the cook, a huge Texas darky, sententiously remarked, that if that particular crowd wanted anything to eat they had better "hustle round right smart." His friend handed him a plate and cup from the mess-wagon standing near, and he helped himself from the steaming pots and kettles round the fire. Probably the fried steak, hot biscuit and black coffee straight would not have

been relished so much on one's breakfast table at home, but in that bracing air one is almost like the Indians, who are said to usually eat anything they can bite. The New Yorker was not so much occupied with the meal, however, but that he could look around him at his companions. Ever since, as a small boy, he had read of the wonderful adventures of the "wild cowboys of the plains," he had had the greatest curiosity to meet them. And now, with more than thirty genuine specimens, almost touching them, he felt none of the awe-struck sensations he had always thought the occasion would warrant. They were for the most part young men, some apparently little more than boys. But the bronzed faces and wiry, athletic figures, told of months of the most active life in the open air, and there was something in the keen eyes and easy carriage which showed that there was that in them which made their calling the synonym of daring recklessness.

A few were regarding him curiously, but there was little said. All were trying to eat their breakfast in the shortest possible time, and talking quietly about the day's work. It had been gradually growing lighter, and all at once the sun rose out from the white cliffs, lighting up the strangest and most beautiful picture he ever saw. Just across the blue river the white bluffs showed where the desert, an unbroken expanse of rugged "bad lands" and alkali plains, stretched away for fifty miles to the Wind River Mountains, whose immense snow-clad peaks rose clear and distinct, seemingly not ten miles distant. Back of them was the soft gray of the broken foothills, and everywhere the creamy-white rocks which the sun had painted with every imaginable shade of rose color. The bright green meadow where we were encamped had scattered over it clumps of cottonwood and willows, making it, in comparison with the, to him, universal desolation around it, a veritable oasis.



AN ORIGINAL TEXAS STEER.

The tinkle of the bells in the distance startled him, and it needed not the quick movements of the men, as they hastily swallowed the last of their coffee and began overhauling riding rigs, buckling on revolvers and coiling up rawhide "riatas" or lassos, to convince him that the real work of the day was about to begin. Their preparations were hardly completed before down from a canyon came rushing the saddle horses, more than three hundred in number, with a great clanging of cow-bells and cracking of long whips by the "horse-wranglers," who all night long had been guarding them as they grazed in the hills.

Now the quiet, determined-looking man pointed out as the foreman made his presence felt, and in a moment horses were rounded up on the flat, the men assigned their mounts for the day, and everything was bustle and confusion. But a short time sufficed for roping the animals from the herd and cinching on of saddles, though not without many angry snorts and emphatic protests from the wilder ones. At a few quick directions from the foreman two of the men sprang to their saddles and started for the hills at a long, swinging gallop. Others follow, scattering out to sweep the entire district to be worked.

The New Yorker had been provided with a powerful bay, whose splendid limbs, heavy muscles and clear-cut, intelligent head showed the points that made his sire famous as a steeple-chaser on many a noted Eastern race-course. His companion for the day was a tall, handsome young Californian, who stood holding a wild-eyed, nervous black, that evidently had not seen many days' hard riding since he was roaming over the hills at his own sweet will. Only asking if he was ready, the "vaquero," one hand on the pommel and disdaining stirrups, sprang to the saddle.

"Now squeal, rear, buck, throw yourself as you will, my black beauty, you will have to surrender," the New Yorker writes, "for you have found your master. At every bound the cruel Spanish spurs are sent home, and the rawhide 'quirt' raises great ridges along his flanks. It is

the finest exhibition of horsemanship I ever saw. Sitting easily in his saddle, the lithe young fellow sways his body gracefully to the motion, and meets every move of the horse with the utmost nonchalance. With one final and unsuccessful effort to dismount his rider, the horse breaks for the hills, and I follow at the top of my speed. The black horse soon tires of his mad run up-hill, and as I pull in alongside we settle down into a long, swinging, easy lope which reels the miles off wonderfully fast, without apparently the slightest fatigue to horse or rider. We scramble up the steep, broken side of the 'mesa,' and strike off in the same unbroken gallop over the hard, level ground, covered with loose rocks and a short growth of sage-brush. I have ridden all my life in the East, but never before experienced anything like this wild, free gallop over the foothills.

"The handsome, intelligent animal under me obeys every touch or word instantly, and takes the occasional clump of high brush or washout almost at a stride, without a stumble. Never have I seen anything that will compare with these mountain-raised horses for agility or endurance. Suddenly we stop, and my companion gazes intently at a few black dots I can barely distinguish away off near the hills. But even at that great distance he declares they are cattle; and, sure enough, in a few moments we see them plainly. Our orders are to drive on all we can find along the base of these hills, and to do this we must bunch up the cattle we can now see scattered along in little droves, quietly grazing. We separate to work from both sides of the little plain. Taking a long circle, I come in at the 'butte,' which marks the limit of our territory, and run right into a bunch of long horned, wild-eyed cows.

"With a snort, away they go, tails up, the little calves bobbing along behind. My horse is all alive in an instant. Ears sharp forward, eyes watching the flying cattle longingly. I can feel him quiver with anxiety for the word that would send him over sage-brush, washout and badger holes at a breakneck speed. But I am not quite cowboy enough for that yet, and the cattle are taking the right direction anyway."

So he followed instructions, riding along easily, looking sharply into every hollow, canyon and "dry arroyo." He found and started other small bunches after the first, and in a short time they came together with some three hundred or four hundred cattle between them, and started them toward the camp. While they did not make half the progress they did in coming, still the riding was harder, for it was zigzag, twist and turn constantly from one side to the other of the herd, to keep them together and moving. Suddenly, out from the hollow to the right sprang a bunch of antelope, their white, plume-like tails streaming out as they raced with long, graceful bounds over the level mesa.

"Somehow," the writer continues, "driving cattle is not half the sport it was, and when we come in sight of the camp once more, almost blinded by the stifling dust, and hoarse with shouting, I mentally vote that part of ranch life a decided bore. In consideration of my being a 'tenderfoot,' we have been assigned to the shortest ride, and arrive first at the round-up ground. Two men take our places; we ride in, and, unsaddling, turn our tired, foaming horses loose to join the 'caviada' a little distance below. For, short as the morning has seemed, that peculiar long lope has carried us over thirty miles of rough riding. At different points clouds of dust show where the others are returning, and soon long files of lowing cattle come streaming down from the canyons, and join our bunch on the flat. The dusty men and steaming horses come trotting in, leaving only enough to keep the big herd from scattering.

"Dinner is waiting, and the foreman urges the men to hurry, 'for it looks as though we would have sharp work this afternoon.' With a rush the meal is bolted, fresh horses caught and saddled, and with a hurriedly rolled cigarette the men are off to work again, seemingly as fresh as in the morning. My own fresh mount is a steady old pony who enters, I find, with great satisfaction into our part of the work, which consists solely in keeping out of the way, and standing around watching the fun. Nor do I long for activity with the enthusiasm of the morning; my saddle is wonderfully hard, and the gait of my noble steed seems very like unto the emphatic movements of a pile-driver. But we take our stand on a little knoll well to one side, and I soon forget everything in the interest and excitement of the scene spread out before me.

"The round-up ground was a stretch of hard gravel, level as a floor, with but few holes. Surrounded by low hills, one could see every movement as in an amphitheater. The herd of over six

thousand bawling, restless cattle were crowding and pushing each other in the center, surrounded by a circle of motionless horsemen. Down in the hollow, in front, was the foreman, mounted on a superb sorrel, surrounded by several men, the picked 'vaqueros' of the outfit. All were riding their best horses, and had thrown off coat and vest, having fringed leather 'chaperajos,' or leggings, flannel shirt wide open at the front, broad sombrero, and the ever-present six-shooter in their belt.

"A few dismounted, picketed their horses well back, and began tearing up the sage-brush on the hillside, a fire of which was soon crackling merrily, and heating the branding irons that were to quickly cause those unsuspecting infant bovines a deal of discomfort. The rest rode slowly out, the big herd was to the further side, and a small bunch, possibly five hundred, cut from it and rounded up not far from the fire.

"Now began the real work. The men were drawn in from the big herd, leaving only enough to keep it together. Rawhide 'riatas' were taken down, and a man rode into the bunch swinging the loop round his head like clockwork. All at once he let it go, carelessly it seemed, so sudden was it; a quick turn or two round the horn of his Spanish saddle, and the horse wheeled and came trotting up to the fire, a stout calf bounding like a rubber ball at the end of the rope. He protested with all his strength of voice and limb at this unceremonious measure, but the relentless noose had him fast, and in a trice the men on foot had him down, a sharp knife has marked his ears, and the hot branding iron had imprinted his owner's trade-mark on him forever, with a sizzle and a smell of burning flesh that was far from pleasant to one unaccustomed to it. He was released, and trotted off to the herd to find his mother, a bewildered and much-used-up individual. Before this one was fairly down another was dragged in, this time by the hind feet, for so expert do these men become in the use of the rope that they catch an animal almost where they choose."

Then followed a scene, common enough to the acclimated Texan, but a trifle bewildering to the New York man on sight-seeing bent. "In a short time," writes that observant gentleman, "everything is in full swing. Four horsemen are roping and dragging out the calves, and the faces of the men on the ground are streaked with perspiration, dust and blood. The air is filled with dust, smoke and the odor of burnt hair and flesh, while the bawling of the calves and their distracted mothers adds to the scene. It seems the greatest confusion, but is in reality perfect order. Every man has his place, and over all sits the foreman on his horse, quietly keeping count in his note-book of the brand and sex of each calf. All at once a quick shout "Look out, everybody," causes a scramble. A lean, vicious old Spanish cow, grown anxious at the piteous bleat of her darling when the hot iron warmed his ribs, has dodged the herder and is coming to investigate matters. Down through the smoke and dust she charges, her eyes flashing fire, and the slender horns, sharp as a needle, look to me fully six feet long. No one on foot waits to see what she wants; all spring out of the way as she comes, too blind with rage to notice any one, but circles round to the herd, where the sight of her calf pacifies her.

"No one seems to mind it much, and the foreman counsels me, if I am ever caught too close, to lie down and let the cow run on over me. I mentally beg to be excused, judging the uncertainty, as to whether she would jump or not, to be too great a strain on one's nervous system. Her calf is about the last victim in this bunch, and now the men drive them away around to the level over the divide, to frisk over hills as they choose until fall, when they will be rounded up once more to select and market for beef."

Another bunch was then separated and driven in, and the foreman told him there would be work to try the mettle in men and horses. His host and friend had purchased a certain brand, or herd, that ran on the same range, and he wished them marked as were his other cattle. They were principally big, wild steers, a different animal to handle from the little calves. As one of the men quaintly remarked, "It's a white horse of an entirely different color."

This work is usually done in strong corrals, but there were none handy, and the foreman went on the principle that a steer in the herd is worth several skylarking over the hills. First the calves followed the same fate as the others, and after all the youngsters had passed through the fiery ordeal, as many as possible with their mothers were worked out, leaving only a small bunch that included the next lambs to be led to the slaughter. This is figuratively speaking only, for candidly they did not look very lamblike, and he had serious misgivings as to the leading process. Their long

legs, powerful bodies, and particularly their long, sharp, slender horns, effectually dissipated any previous desire he might have had to be a Spanish bull fighter.

Every one paused to rest a moment, and the ropers changed their horses for fresh ones standing near, "cinching" their saddles until their horses fairly groaned under the pressure of the heavy horse-hair girth. They had hardly mounted when one of the wildest steers broke through the line and started for the main herd. Sending the steel into their horses' shoulders, two riders started for him. The horses, the best in a great herd, fairly flew as they skimmed over the level ground and overtook him just in time. But he did not give up; fleet and quick, he dodged and turned and tried to rejoin the herd. Where would the fancy English hunting seat be now? The horses, trained to their work, twisted, turned and dodged with them, now whirling in almost their own length, and again reined back on their haunches, while the cowboys, sitting squarely, stirruped at full length, bent to the sharp curves, with never a glimpse of daylight over the saddle seat.

He made for the hills, was headed, and they swept by within a few feet of them, the steer with head low, thoroughly scared, running for dear life. Close behind was the horse, straining every nerve, his breast white with foam, and his rider's eyes blazing with excitement, riveted on the flying animal and whirling the riata round his head. Quicker than thought he had thrown it, caught the animal by its forelegs, and it came to the ground with a crash sufficient to break every bone in its body, causing the horse, which had stopped and braced nobly for the shock, to plough long furrows through the sand.

In a moment another rope was round his hind feet and the horses stretched him at full length, while the brand was quickly burned on. When the ropes were loosened he got up and trotted tamely to the herd, a much sadder-looking and more lamb-like steer. The usually undemonstrative foreman nodded approval to the gallant "cow-puncher," who smiled at the enthusiasm as he dismounted and loosened the cinch to rest his panting horse.

The remaining cattle were handled in the same manner, but without the excitement of the first, as none escaped the close line of horsemen that formed a living corral. Then more calves, and so on, until just before the sunset, the last of the big herd were turned over the divide, and the long, hard day's work is done. Tired, dirty and hungry, men and horses came straggling slowly into camp.

"After supper," concludes the story-teller, "in the fading twilight, the men lounge round the big camp fire with pipe and cigarette, and I see the genuine cowboy as he is—an honest, reckless, whole-souled man, kind hearted and generous to a fault, who would divide his last crust with, or give his life for, his friend—not the ruffianly desperado painted by so many Eastern papers. Of bad men and desperate, there are many on the frontier, but few of these will endure the hard work and moderate pay of the cow-camps. Many are the yarns of the dangerous and exciting life, which only the combination of a camp fire with a remarkably vivid imagination can produce, and I longed madly to see more of the wild, free life of these nomads of the mountains. And it has its fascinations that only those who have lived it know."

While this chapter was being written there appeared in the St. Louis "GLOBE-DEMOCRAT" a singularly interesting narrative, by Mr. P. W. Horn, on the subject of modern branding, and the work as it is done in some parts of Texas to-day. It took the form of an interview with Mr. Jonas Keith, who, it was explained, "has been at the business long enough to know what he is talking about." The article is so readable and appropriate that it is reproduced at this point in order that its wit and range-lore, to coin a word for the purpose, may be preserved more permanently than would be possible with a newspaper publication only. Mr. Horn opened his story by recording a question as to what is the hardest piece of work a man in the cow business in Texas ever has to do. To which Mr. Keith replied:

"There are a good many things he has to do that haven't much fun in them. Standing guard in the rain or riding around 'em on a dark night would neither one be considered a picnic by most people, but when it comes right down to sweating and tugging and good old hard words, I believe branding beats any job I ever tackled."

"Perhaps the reader," Mr. Horn continues, "may be a little inclined to wonder how the mere making of marks on a cow's hide can involve any really hard manual labor; but if he once learns the

details of the process, all wonder on this point will cease. He will learn, furthermore, that it requires not only muscular strength, but experience and courage and brains. The average hard-working Missouri farmer would find it about as hard to make a success at branding cattle in Texas as he would at building ships in Maine.

"Of course, in order to brand cattle, one must have the proper tools. Branding irons are of two kinds—stamping irons and dotting irons. The former consists of a wrought-iron stamp containing all the characters in the brand. For instance, if the brand were X I T, there would be an iron stamp composed of these three letters, with an iron handle running back from some convenient point, as the middle of the I. These stamps were formerly much in use, but have now become almost completely abandoned, except among the very largest 'outfits.' Their place has been taken by the dotting irons, which consist of nearly a straight iron rod and a half-circle with a long handle attached. With these two implements any letter in the alphabet can be made, and an astonishingly large variety of other characters as well. For instance, the reader can easily understand how the X I T outfit makes its brand by five applications of the straight rod. 'B' requires one application of the straight rod and two of the half-circle. This may not make a very beautiful B, but it makes one which any child that knows its letters would be apt to recognize. If more elaborate designs are wanted, the simple dotting irons are found sufficient to produce them. The straight rod is generally about a yard long, and has a ring in the handle end. The handle to the half-circle is about the same length. They are generally heated in a brisk fire on the open prairie, though on the large ranches there is sometimes a furnace built especially for the purpose.

"For branding any class of cattle properly at least four men are required. Of these four, one is the roper, two are bulldoggers and the fourth is the puncher. As I am writing in the English language, I take it for granted that my English-speaking readers all have a perfectly accurate idea of what these words mean. Of course, we all know that a roper is one who ropes. If necessary one man can do all the roping required, but two men do better. The roper throws his lariat around the neck of some animal to be branded, and then, by the main strength of his horse, hauls it up within a reasonable distance of the fire. The horse he rides is called the cutting horse. He is called a cutting horse, not because he can cut, but because he is used in cutting out cattle from the herd. Some idea of the hardness of the work may be derived from the fact that during the branding season each roper is allowed from ten to twelve horses for his own individual use.

"When the roper has driven and dragged the steer to be branded to the usual place, he turns him over to the bulldoggers. These men catch hold of the animal and hold him while the puncher applies the hot iron. Does the reader imagine that he and some other man like him could tackle a big full-grown Texas steer and hold him down? Possibly they could if they knew how, but knowing how is the trouble. Even one good able-bodied man can do so if he can manage to get the right kind of grip. Usually, when there is one bulldogger, he plants his knees squarely in the flanks of his prostrate victim, passes the animal's tail back between its legs, and grips it firmly with both hands. It might be well for the reader to remember this the next time he wants to hold a vicious cow down. The attitude may not be a very graceful one, but it gives the man a death-like grip on the brute. The horns may toss viciously and the fore feet pound away at a vindictive rate, but as long as the grip on the tail holds, the hinder quarters stay close to the ground. It is hard on the cow, but it is also hard on the muscular strength of the man who does the holding. For this reason the bulldoggers generally work in pairs. One of them takes the grip just described, while the other one grasps a fore hoof of the animal in each hand, as if in the fervor of a double hand-shake. When it is a colt that is being branded the attitudes are varied. One man holds its head down, or sits on it, while the other sits down flat on the ground and grasps the upper one of its hind legs firmly in both hands. One might think that for two men to hold a calf down is not very hard work, but when it comes to doing so for hour after hour the work becomes exhausting. Even at best the bulldogger's position lacks a great deal of being a sinecure.

"The time of year when most cattle are branded is in the spring or fall. Most of the calves are of suitable age in the fall, but for grown cattle the spring is preferred, because they shed most of their superfluous hair then. Calves are branded any time after they are two weeks old, but from three to six

months is the usual age. Stockmen say that a full yearling is the hardest animal they ever have to brand. If any man thinks one at that age isn't tough and muscular, just let him try to hold one down. There is one peculiar feature about branding calves, and opinions in regard to its cause vary very widely. Sometimes when a young calf is branded the brand will grow as the calf grows, and when the animal is full-grown, will be fully twice as large as it was originally. Then, again, sometimes, it will remain just as it is, not growing a particle. This seems to be really a remarkable phenomenon, but it is undoubtedly a fact. Some stockmen account for it by saying that it depends upon whether the calf is branded in the dark or the light of the moon, while others are inclined to think it depends more upon the depth to which the branding iron burns the hide. The reader may accept either explanation he likes. Between the two I should prefer the latter, as it would give me much pain if I believed that such an innocent-looking moon as ours could be responsible for all the manifold eccentricities and irregularities of earthly things I have heard charged to it in Texas and elsewhere. It is a fact that branding is sometimes done much more deeply than at others. If the iron is hotter than it ought to be—red-hot, for instance—the hair may catch fire and a needlessly sore place be made on the animal. If it is just hot enough, an application for two seconds is long enough. If the iron is getting cold, it may be kept on the animal for half a minute. Sometimes the bulldoggers have to hold the animal down for ten or fifteen minutes, while the puncher goes and heats his irons a second time.

AN IDEAL BEEF PRODUCER.

"Perhaps the reader understands by this time that branding a large herd involves a large element of real, hard work. He should also understand that in selecting a new brand, a cattleman has to exercise a good deal of discriminating judgment. To originate a really good brand is about as hard as to devise a catching title for a modern book or story. In fact, a new brand is selected very much as is the title of a modern novel. It is not necessary that either one should mean anything in particular, provided only it is something nobody ever thought of before, or is ever likely to think of again. For instance, my friends, Messrs. Price and Keith, brand all their cattle with a large V. Of course, V does not stand for Price, or Keith either, but then it is an easy letter to make, and one that is as little likely as any other to stand for some other fellow's name. Then, again, it would be tolerably hard to change it into some other letter. To get an altogether new brand in Texas is now a very difficult feat. Every letter in the alphabet has been used long ago, many combinations of letters, and all reasonable combinations of figures. A man must be very hard up when he would devise one like this (7777). An algebra student, by the way, would read that 'seven thousand seven hundred and seventy-seven in parentheses,' but the cowman calls it 'four sevens in brackets.' Similar ones are as follows: (9999), (6666).

"These three, as well as the others given below, are well-known brands in actual use in Western Texas. Sometimes it takes about as much ingenuity to read a brand after it is written as it does to think it up beforehand. This is especially the case when the designer gives up letters and figures and tries to represent some object, for the puncher is not always a strictly first-class artist. Not long since I saw a horse that seemed so weighted down with the burden of the letters ornamenting the

whole of one of his sides, that he had little strength for anything else. He read as follows: U S I C S (X). This brand was a complete record of his history. In his younger days he had been bought for our cavalry service and branded U S. After awhile he was worn out, and then received the additional I C for 'inspected and condemned.' When the Government sold him it was recorded by an 'S,' and the man that bought him added the (X). If he is sold any more his next owner will have to begin branding him on the other side. The United States Army officials will not purchase a horse that already has a brand on it. Whether it is because they consider branding an inhuman device, or because they do not want a horse so disfigured, or because they need all the space for their own brands, I do not know."

The following admirable sketch of ranch life and of the general work of a cowboy, is equally instructive, and has the advantage of having been written on the scene of the occurrences of by-gone years by a practical Kansas man for the valuable, and indeed classical, work on American Farming, by Charles L. Flint, who, for more than a quarter of a century, was Secretary of the State Board of Agriculture of Massachusetts. Mr. Flint's correspondent writes of his own experiences and of the habits of Texas and Kansas cattle with the detail of an expert and the brightness of a professional writer.

"It is the early dawn of a May day in Western Kansas. A sea of rolling billows of land extends in every direction to the utmost reach of the vision. The plains are covered with a rich growth of blue joint and buffalo grass. A herd of cattle is sleeping in the corral by the creek—cows, two-year-olds, yearlings and calves. A few ponies are picketed with long ropes on the prairie. A couple of saddles, blankets and bridles hang on pegs by the corral bars. The scene is eminently peaceful. Occasionally a cow rises, and, walking to the salt barrel, generally licks the salt, then licks her nose as though she had serious thoughts of pickling it so as to ensure its keeping over summer. But on reflection she concludes it will keep this season at any rate, and walks over to the stretching posts and there stands rubbing her neck up and down.

"Suddenly stopping she gazes, open-eyed, at a wolf, who sits on her haunches some hundred yards from the corral, sitting there pensively, looking at the great amount of fresh meat. After gazing at the wolf until satisfied, the cow lies down again. The deep breathing of the cattle, the morning calls of the meadow larks, the soft music of the wind as it whistles through the short, tender grass, are the only sounds heard. As the East grows red, the occupants of a large dug-out, situated by the bank of a creek, lounge slowly out and walk to the water, where they drink and wash—the latter is a speedy operation, as the herder does not waste time in washing. One goes to feed the ponies corn and saddle them, the other builds a fire and cooks the breakfast. This meal consists of corn dodgers, or baking powder biscuit, fried bacon, and strong coffee without milk or sugar. There may be two hundred cows in the herd, but none are milked.

"The herders simply exist with as little trouble as possible. As a rule, they do not read, do not think of anything but the cattle. To attend these well is their ambition. After breakfast the bars are taken down and the cattle string slowly out of the corral. Forming in long lines they follow the deep, well-worn trails that lead to the feeding grounds. It is a very leisurely march. Now and then an animal drops out of the file, eats a few mouthfuls of grass, but soon drops into file again and resumes marching. On reaching the desired feeding ground, the cattle spread and begin feeding. At about ten o'clock they are full, or nearly so; and, in a listless manner, they change front and feed toward the water. Arriving there, the herd drink, stand in the water, and so 'loaf' away an hour. Then they lie down and for two or three hours remain quiet. As the sun gets low, the cattle again spread and feed. As the sun sinks to the horizon, the herders slowly force them to feed toward their corral, and by the time they have fed up to it, it is generally dusk. Bars are put up, ponies staked out, supper cooked and eaten, and the herders go to bed.

"In all herds there are a few animals that lead off; that is, they will not remain on your range, but constantly endeavor to lead the herd to pastures new. These animals are generally yellow or black steers; but sometimes cows and heifers are guilty of the trick. Of course these animals are sold as soon as possible, but until sold, they are the cause of a vast amount of hard riding. The cattle of Texas are not afraid of a man, nor are they afraid of a horse, but they are afraid of a man on a horse. They do

not seem to understand that a man on horseback is a combination of animals. Apparently they regard the two as one animal, and one that is too powerful for them. To get off a horse in a herd of wild Texas cattle is almost worth a man's life, and an experienced herder will never do it.

"All herds of cattle have a bully among them. There is a boss cow, and she is hated and feared. Of ugly disposition, constantly hooking unoffending cows, greedy in eating, she makes herself generally disagreeable. Or it may be that the bully is a steer; the characteristics of the brute are all the same. The rest of the herd are all afraid of her or him. Singly they can do nothing. Matters go from bad to worse, and cow life becomes almost unendurable in the herd. Something has to be done, and that soon. The bully in walking along gives some unoffending cow a sharp thrust in the ribs. Instead of running off, as expected, the stricken cow wheels around, fury in her eyes, and, bellowing a war cry, dashes head on for the bully. The boss is surprised, but gets to work as an expert, and the rebellious cow is being rapidly whipped (these cattle fence with their horns), but the cry for liberty is understood by the rest of the herd, and with a unanimous movement they all turn on the tyrant, and if the herders do not interfere, they kill him.

"The bully, being whipped, turns to run, and to his horror finds that the whole herd are after him. As one animal gets near him, he receives a vicious dig from a sharp horn. He increases his speed, but soon another animal comes up to him, and another stab is the result. The bully, with extended tongue and labored breathing, is leading the herd, and the herd, with extended tongues and upright tails, are following—steers, cows, calves, all bellowing loudly, 'kill him!' 'kill him!' And kill him they will if the herders do not stop the pursuit.

"After a lesson of this kind the bully is a marvel of gentleness and consideration. A calf could whip him. Once I left my herd for an hour. On my return I was surprised to find the cattle bunched around a deep pool in the ravine. They were evidently greatly excited; the constant bellowing, the lashing of their tails, their craned necks as they looked over the banks of the pond, all indicated that something was wrong. Running my horse and swinging a heavy whip, I was soon among the cattle. They gave way for me. I rode up to the pool. There, standing in deep water, was the bully, a ring of excited steers and cows standing around him, but unable to reach him. I put a stop to the fun, and left the bully in the water to cool off. I did not see him for a week. Then he joined the herd a private. If an animal in the herd gets badly wounded, it will be killed by the others if great care is not exercised. The sound animals turn ruthlessly on the sick or wounded ones.

"It looks hard, and the unthinking observer remarks on the cruelty shown to one another by dumb animals. It is simply an expression of the instinct of the animals, by which they expect to ward off attacks of wolves, and to prevent their prowling about the herd by removing the inducement to it. The animal is wounded, badly wounded; the wolves smell him, and, from far and near, gather about him. The cattle in their wild state constantly moved up and down the water courses; so when they killed the sick animal they left the body behind. Now they kill the sick one for the same reason, and daily feed about his carcass.

"In July the herd is fat; calves are doing well and are full of play; grass is plenty, and the herd, as a whole, feel splendidly. They are easily amused, too. Jack rabbits are plenty in Kansas, and are a never-failing source of amusement to the cattle. Accustomed to the habits from their calfhood up, it is simply absurd to see the actions of the animals. A calf finds a big jack rabbit, and, very naturally, is interested in looking at this wild beast. Cautiously approaching him, she gazes open-eyed at the small monster. Another calf joins her, and they each regard the animal. Beginning to caper about it, the attention of the herd is attracted, and they all come up to have a look at the jack. He is made to get up and jump quietly off. The cattle all follow; the rabbit sits down, again to be forced up; and when he again jumps off they caper around him, or, with pretended alarm, they bellow and run away.

"Many men who came to Kansas in 1869 went into the cattle business, bringing Eastern ideas with them. They very naturally built sheds to protect their cattle from the cold storms of the winter. I did this, and made a mistake. The reason why sheds are not good is that the cattle stand under them when the cold winds blow, and refuse to leave the shelter to feed or drink, and when weakened by this lack of food they lose vitality, and huddle together for warmth. This huddling together is very

dangerous; the outside cattle want to be on the inside, and they pile up on each other. This piling is called 'stacking,' and when once begun, some of the cattle are sure to lose their lives. Out of one stack I took twelve dead steers one morning. A neighbor of mine took thirty-six dead beeves out of one 'stack.' After losing the twelve steers I took down my sheds, and that ended the trouble."

We pass from this realistic picture of cowboy life and cattle characteristics, to note for a moment the nature of the work the cattleman and his help are called upon to perform on the road to market. As we have already mentioned more than once the railroads have put an end to most of the necessity for trail driving which, under existing conditions, is hardly possible. But even in the days of railroads there is still a great deal of driving to be done. When the day of delivery to the drover arrives, the animals are driven to some previously secured corral, and when all are in and the herd is complete, then the job of road-branding begins, which, by the aid of plenty of help, is soon completed. All things being ready, a start is made, but not before the drover has secured and recorded a bill of sale from each ranchman or his lawful agent, from whom the stock was purchased. The bill of sale sets forth not only the ranch brands, but all the ear marks. The appearance of a bill of sale is much like Egyptian hieroglyphics. The more a Northern man looks at one the less he knows about it. But it is necessary for the drover to have it, for without it the officers of the law would regard him as a thief, and, of course, arrest him. Now that a start is once made, hard driving for the first few days is the custom. For several reasons this is done; first, in order to get the stock off of their accustomed range, whereon they feel at home, and know all the country, and are much harder to keep under control than when on strange ground; second, it is done to break or accustom them to being driven, at the same time to tire them by hard traveling so they will feel at nightfall like lying down and resting instead of running off, as they would be sure to do if they were not fatigued.

"We have heard," says a well-known writer, "drovers say that they have traveled the first three or four days at the rate of twenty-five or thirty miles per day. But as soon as the cattle are driven off of their usual range, and are got on to the regular trail, the distance of a day's drive is reduced to ten or at the most fifteen miles. They are permitted to go out on the range in the morning early and to feed, care being taken that they be kept headed in the direction the drover is desirous of going. They will feed along for two or three miles, then turn into the trail and travel three or four miles, when, after drinking their fill of water, they will lie down and rest from two to four hours in the middle of the day. Getting up from their beds, they soon turn from the trail upon the grass and take their afternoon feed preparatory to being rounded up for the night. When upon the bed ground one or more men remain with them during the silent hours of the night, being relieved by regular relays from the camp, much as the soldier upon guard is relieved. With each herd are about two men to every three hundred cattle, and each man should have at least two saddle horses, which he rides alternately, they living exclusively upon the grass. The extra horses not under the saddle are called the cavvie-yard, and are driven behind the camp wagon, which is drawn by one or more yokes of oxen, and is often a cumbersome, rude cart, made with an eye to strength rather than beauty, and is made the receptacle of the provisions and camp outfit."

To drive a drove of cattle properly under these conditions more patience and perseverance than labor was required, but, at the same time, the duties of the cowboy was often arduous, and he was frequently exposed to great danger and hardship. To partly offset the difficulties and reduce the expense, it was frequently the practice to have a few old and practically worthless animals included among the younger steers in order to check stampeding. This occasionally had the desired effect, but it is a characteristic of Texas native cattle to run an immense distance. The better bred cattle of to-day carry more weight than their native ancestors, and seldom run a very long distance. But in the old days, when excessively long distances had to be traveled, the animals on the trail would be guilty of a great deal of wandering from the straight path. One or more cowboys always took the lead on exceptionally good ponies. Their duties consisted not only in keeping the leaders in the right direction, but also in driving off range cattle which were met in order to prevent the delay and trouble of cutting out, which otherwise would be necessary. When the herd was large it was strung out at considerable length, and cowboys were employed to ride up and down the lines and keep the stragglers in their places while others brought up the rear.

It was at night that the most difficult and tiresome work had to be performed. When an immense herd of cattle were being driven, precautions taken against trouble during the dark were elaborate in the extreme. Tex Bender, known as the "Cowboy Fiddler," writes in an entertaining strain on the occupation of night watching. His remarks, while of course they apply to a certain extent to the duties to-day, are more directly intended to refer to trail driving of old days, and they show the peculiar habits of range cattle as observed by a man who worked among them for many years. It is important, this writer points out, that the herd should never be left unwatched.

"When at night it is thought time, they are driven onto a bedding ground and bunched up. So soon as they have steadied down, one or two men are left on watch, whose duty it is to ride round and round the herd and prevent any straying. If the weather is not too cold, the night watch not too long and the cattle behave well, this is not disagreeable work. The cool air is refreshing after the long day's heat and glare; you walk your horse at a little distance from the cows, with an occasional short scamper after some rebels; you must, however, keep moving, and show yourself constantly on all sides. One by one the animals lie down. You hear a great puff as if all the wind was let out of a big air cushion; it is a steer settling down onto his side; more puffs, the shadows sink low, and at last there are none left standing. The quiet of all these huge animals is impressive, and seems in keeping with the sleeping earth and calm sky; the voices of the men in camp hardly reach you; a flicker from the fire catches the higher part of the wagon and just marks its position. Provided nothing extraneous disturbs the peace, the cattle will lie still up to eleven or twelve o'clock of night, while you circle in the darkness round the black patch on the ground, keeping a sharp lookout for any shadowy objects sneaking off in the gloom, and often riding to investigate a suspicious object, which turns out to be only a bush.

"Before midnight, under some special ordinance of nature, the cows are restless and get on their feet; a few will try to feed out; these you must drive back again. But before that time, if holding the first watch, you have probably been relieved, and are back in your bed. Each man has a horse saddled and picketed near the camp all night; as, if anything frightened the herd, or a storm came on, all hands must turn out and mount. If the cattle are really away, you must be after them without delay, and so soon as you can, stop them, bring them back to camp, provided always you know where it is. Any one left behind will make a good bonfire to direct the boys; but a dark night with rain prevents you seeing far, and the camp has often been chosen in a sheltered spot, which makes it more difficult to discern the blaze. The main thing is to keep the herd together, whether still running or halted. If matters have been well managed, and no serious disturbances have occurred, the herd makes up and starts out at daylight. You string them out along the trail, and take a count, or look that all the bulls and other animals with distinguishing marks show up present to the roll-call, and move off on another day's expedition."

The work to be done under the modern system of shipping is very different. When the pens at the railway stock yard are full the steers are driven up a chute into the cars. There is not much trouble with the first few animals, but toward the last a good deal of pushing and crowding has to be done in order to fill the car, and unless proper precautions are taken, injury is apt to result. As soon as the last cattle have been driven in, the train starts, and on most lines they are run rapidly, and given the right of way over ordinary freight, and even passenger traffic. The present improved cattle tracks enable cattle in transit to be fed and watered very thoroughly, but on long runs the train is halted daily and the cattle taken out to feed. During the night, in the train, the cowboys in charge have to force to its feet any animal that has laid down. Unless this is done animals are trampled to death, and serious loss results. So expert do cowboys become in their work that they are expected to load two or three hundred beasts into the train in twenty minutes, and any delay is regarded as serious.

Although the railway journey to Chicago, St. Louis or other markets is less arduous in some respects than the old work on the trail, the journey is far from being comfortable. The boys have to get what accommodation they can in the caboose which is often crowded by railway officials. No sleep is possible during the night, because at every halt the men must jump out, one with a lantern and others with goads, walk along the rough ballast and peer into each car to discover beasts which require stirring up. "Having found an offender," writes Mr. Bender, "you poke her, prod her, twist her tail,

and do your utmost to make her rise. In the middle of your efforts the bell rings, the train starts; you clamber up the side of the car onto the roof, and when there make the best of your way back on the top of the train to the rear car. This little trip in the dark is not one to enjoy. There may be twenty cars, say forty feet long each. Before you have crossed two or three the train is going at full speed. Only one man has a lantern; you are incommoded by a heavy great coat, as the air at night is keen; the step from car to car requires no more than a slight spring; but it is dark, or, probably worse, the one lantern is bothering your eyes. The rush through the air makes you unsteady; no doubt your nerves are making your knees feel weak. It is a hard alternative: to get back to the caboose, or to sit down in the cold on the top of the train until you reach a halting place; having tried both, it seems that neither can be cheerfully recommended. If you do not climb onto the roof you must take your chance of jumping onto the step of the last car as it goes by; this would be the reasonable way if you were allowed to do it, but as the engineer does not care to look back, you must consider whether you are sufficiently an acrobat to rejoin. Having reached Chicago there is an end of the business; the cattle are turned into the big stockyard, and sold by commission."

ECHO CAVE, PALO DURO CANYON, TEXAS.

CHAPTER XII.

An Essay on the Shortening of the Horn and the Improving of the Breed.

THE misapprehension which prevails in various parts of the United States as to what is going on in other portions is one of the natural consequences of the immense size of the country. Texas itself is an empire of magnificent distances, and even to-day with the excellent railroad service which prevails, a journey from one portion of the State to another is often both tedious and lengthy. It is not very surprising in a country upon some portion of which the sun never sets, and which includes both tropical and arctic regions within its domains, that the people of the North should know comparatively little concerning the manners and customs and habits of the South. Nor is it to be wondered at that an entirely erroneous impression should prevail as to the cattle to be found roaming on the plains of Texas. A generation ago fences were unusual commodities in the Lone Star State and cattle roamed largely at will, herded and finally rounded up in a manner now impossible and unnecessary. Other changes of a phenomenal character have passed over Texas during the last thirty, and even twenty, years, but, perhaps, no change has been more conspicuous or interesting than in the grade of cattle raised and pastured within its extensive borders.

When there was an abundance of free pasturage it was only natural that native cattle of the hardiest possible character should be raised. The Texas steer, with its abnormally long horns and general "cussedness," was then monarch of the Texas plain. An illustration is given on page 183 of one of these peculiar animals whose horns measured three feet six inches, from tip to tip, and which weighed at the age of five years less than a thousand pounds. To-day an animal of this grade can still be found in the Southern portions of Texas, but the horn has gradually shortened, and, in a measure, even disappeared in the Northern counties, while the lank and lean appearance has given place to a larger body and a greater capacity for putting on flesh.

Allen, in his "American Cattle," one of the best and oldest authorities on the subject, asserts that the Texas steer is the lineal descendant of the early Spanish stock imported into Mexico by the adventurers and pioneers of the sixteenth century. The writer of this work spent some months in Spain a few years ago and is inclined to think that Mr. Allen is absolutely correct. Spain is one of the least developed countries of Europe at the present time, and it still contains immense quantities of unimproved grazing and mountain land. On this land herds of cattle very similar to the ancient Texas ideal are to be seen; and it is also to be noted that the climate of Spain resembles, in some respects, that of Texas and Mexico, without, of course, the "northers" which, from time to time, visit the former State.

Professor Lowe, a European authority on domestic animals, writes even more pertinently concerning the introduction into America of the ancestors of the typical Texas steer. He agrees with Professor Allen as to the Spanish descent, but is of the opinion that the animals came to this country via South America. He even goes so far as to assert that "the origin of these amazing herds which cover the plains of Paraguay, Buenos Ayres and other provinces, is traced by Spanish writers to the arrival, by way of Brazil, of seven cows and a bull from Andalusia at the city of Assumption on the ship Paraguay in the year 1556." He proceeds to give instances of direct importations from Europe to Mexico, and also from South America into that section of the continent which we now speak of as the Latin-American Republics. From the latter to Texas the distance is inconsiderable, and when the history of the State is remembered it will readily be understood how the Spaniards left behind not only many landmarks and buildings, but also a distinct type of cattle.

Mr. George W. Curtis, Director of the Texas Experiment Station and Professor of Agriculture in the Agricultural Mechanical College of Texas, describes the original Texas cattle as of varying color, with light dun and mouse color predominating, although not sufficiently to exclude reds, yellows and blacks. A resemblance to Spanish cattle generally is shown in a tendency to lighter color hair around

the muzzle. The cows, the Professor states, are practically worthless for the dairy, few giving more than one or two gallons of milk per day on good feed. But, he adds, the value of the race to the whole country where it owns a natural home can hardly be overestimated. Texas steers, he estimates, average from nine to twelve hundred pounds at four years old, grass-fed, the cows seldom exceeding the first named weight. A distinguishing feature lies in the extraordinary size of the horns, which assume various wide-spreading shapes, sometimes measuring upward of four feet from tip to tip.

Mr. Charles L. Flint, writing in the year 1882, also attributes the origin of Texas cattle to Spain, and says they were introduced into Mexico about the year 1500, when Texas was a part of that country. He also says that they are identical with the cattle kept for many centuries by the Moors and Castilians, and speaking of them he says: "The cattle thus imported into Mexico covered the vast grazing plains of Texas and California, becoming to all appearances wild cattle, feeding upon the abundant herbage the climate and soil of these regions afforded. Immense numbers of them have been killed annually until within a few years, simply for their hides and tallow; notwithstanding they had increased to the extent that within a few years their estimated number in Texas alone was over four millions, and at that time constituted about one-seventh of the cattle of the United States and Territories. They congregate in large herds, and range and propagate with little care, being known to their owners only by the marks or brands that are put upon them. They are gathered once a year for identification, when the calves are castrated and branded, while those fit for beef are selected and driven to market. They are impatient of restraint, and, having led a wild, roving life, never become really domesticated. When from five to seven years of age they average about a thousand pounds, live weight, but when fed on corn for some months they will reach an average of twelve hundred pounds, with perhaps from six hundred to seven hundred pounds of marketable beef, as weighed from the butcher's block. These cattle are of almost every color ever represented in a bovine animal; they are tall, lank and bony, with coarse heads and exceedingly long horns; flat-sided, swayed in the back, with high flanks, narrow hips and quarters, and long and coarse legs. As beef animals, they have a large amount of offal in proportion to their flesh. The cows give only sufficient milk for the nourishment of their offspring, and are nearly as large as the oxen."

Such is the very brief description of Texas cattle of ante-bellum days. In the opinion of many who have not given the subject a thought the Texas steer of to-day resembles the peculiar animal which roamed at will over the plains during the sixties and, indeed, the seventies. It is part of the mission of this work to show that this is an entirely erroneous impression. Car loads of Texas cattle, with their immense horns interlocking, are still occasionally to be seen, but these are shipped almost exclusively from extreme Southern counties. Tens of thousands of dollars have been spent in improving the breed, and the average Texas steer of to-day is worth infinitely more than the average Texas cattle which used to be looked upon as the best the State produces and as the most profitable breed to be raised and perpetuated.

General Brisbin, whose interesting work entitled "BEEF BONANZA" has had an international circulation, writes in an entertaining manner concerning the habits and customs of Southwestern cattle. After citing the fact that he visited the herds of the Plattes and made careful inquiry as to the number of cattle and the profits derived from cattle breeding, he said:

"On the Laramie plains I saw the finest cattle, and one herd in particular pleased me, a drove of fifteen hundred cows, with twenty-three hundred calves of various ages. First we came upon a few stragglers, or warders, guarding the herd, which seemed to be sentinels over the calves. Next, we found families of two, four, and six in groups, then bunches of a dozen, and lastly the great body of the herd. The cows were Texan, bred to large Durham bulls, and the calves bore strongly the impress of the male. Nearly all had thick necks, sturdy bodies, and seemed very healthy. I saw one enormous bull, and near him a cow with three calves, one a two-year old, one a yearling, and one about two weeks old. It was a grand sight this herd of fifteen hundred cows, fifty bulls, and twenty-three hundred calves. They were much scattered, covering the prairie for miles, and seemed an endless mass of beef for one man to possess; yet I was told that the gentlemen who owned this herd had three larger ones. I saw a little calf just taking his first steps on the prairie, and stopped to observe him. The cow ran away at my approach, but immediately came back and stood resolutely and defiantly by her young;

indeed, so wicked did she look, that the driver whipped up his horses and got away as soon as possible. These Texas cows are dangerous if approached too closely, and, from the fire in the beast's eyes, I am sure she was going to charge.

"It is a study to observe the habits of the prairie cattle. They run in families like buffalo, the cows keeping their calves with them sometimes until they are three or four years old. It frequently happens that the mother has under her protection sons and daughters larger than herself. The cow watches over her offspring, and when they disobey punishes them with her horns, to which they tamely submit, like well-trained children. In the middle of the day the cattle leave the high grounds and go to the river bottoms for water, and about nightfall return to the high grounds. In traveling back and forth to the water they march in single file, using the same paths as the buffalo, and, like them, wear deep ruts in the earth. The cattle frequently go four and five miles to water, but, having slaked their thirst, nearly always return to the same ground from which they started out."

It is rather more than twenty years since the first extensive importation of high-grade stock into Texas commenced. The work was retarded by fear as to the serious consequences which might result to a valuable stock from Texas fever and other disease. It is a fact that in some cases valuable stock imported for the purpose of improving the breed did suffer in the manner stated, and a great deal of unnecessary comment arose. Those who made attacks on Texas in consequence of some of the failures in the attempt to breed up to the long-horned Texas cattle, overlooked the fact that acclimation is something which has to be understood and mastered by every living creature that is suddenly moved from one climate to another. The cattle taken an immense distance to the plains of Texas were frequently exhausted after a long journey in unsuitable cars far inferior to those now used. During the journey they had frequently been poorly fed and indifferently watered; the result being that after they were driven out to pasture in their new home, they were in bad shape and succumbed easily to disease.

This is not a work on botany or agriculture, or something might be said of the difference between the grasses found in the different States. It is, however, obvious, that while the grass of Texas is eminently suited for grazing purposes and is able to withstand extremes of temperature in a most extraordinary manner, it is entirely different in substance from the blue grass of Kentucky and Missouri, and still more different to the grasses to be found in the States of Illinois, Ohio, and further East and North. The conditions of herding cattle in the North and East are even now very different, and a quarter of a century ago the difference was still more marked and important. Hence it would have been very extraordinary had the first attempts at introducing better blood into the stock of Texas cattle proved a success.

The point that ought to be made clear to all critics is, that there is no insurmountable difficulty so far as Texas is concerned in acclimating cattle from a distance. Efforts have been made to introduce into other States, both within and without the alleged infected area, breeds of cattle which have been healthy and vigorous in other States, and some of the results have been heartbreaking. Many a farmer who has been induced to change his location, has taken with him his farm stock only to find it die off on his hands with apparently no reason whatever. Sometimes it resulted from the complete change in food; at others from the even more marked change in the quality of water, and sometimes from the too sudden change in climate. On one occasion an English colony brought with them from the old country a number of well bred cattle, some Shorthorns and some Jerseys. They located in Dakota, and during the first winter lost their entire stock, with the exception of one heifer, which was the poorest and least symmetrical in the entire herd. No one has yet suspected Dakota of being a hot-bed of Texas fever, and the cause for the calamity was a very different one.

After the first efforts and a few instructive, albeit disastrous, failures, more care was taken in Texas in the matter of details of importation. A Texas cattle raiser contributed to the National Live Stock Journal some years ago a very admirable article showing how precautions could be safely taken against loss in the manner described. After suggesting that the importations should, as far as possible, be limited to the animals of six or eight months old or even younger, the writer goes on to give directions, which are such a good index of the steps finally taken to produce the important results achieved in the way of breeding up Texas cattle, that we here reproduce a portion of the article:

"The cars for transportation should be well bedded, and food for the entire trip transported with the stock. Arrangements should also be made for a through trip when starting. Food, water, and careful watching by the herdsman will land them at the place of disembarkation but little damaged by the trip. Care should be taken not to crowd too many in one car. Thirty head can be taken if they are properly cared for, yet twenty-five head would do much better. The calves designed for shipment in one car, if more than one is to be sent, should be permitted to run together for some time previous to starting. After reaching the terminus of their journey by rail, a week's rest, in dry lots, should be granted them, with the same kind of food as before shipment. When taken any distance, slow and easy travel should be given them. If either costiveness or its opposite is exhibited, simple remedies should be given to prevent the too active purging or relieve the constipation. The preparation for the reception at their Texas home should have been completed in advance of their arrival; and in addition to a supply of corn, oats, and wheat bran, pure running water and a free access to a growing oats or barley patch, which should have been sowed in early autumn for their benefit, should be allowed. Suitable protection must be provided to guard them from the cold blasts of our 'northers,' giving, also, prompt attention to any symptoms of fever, as follows: When the animal is discovered ailing, one tablespoonful of powdered charcoal, one teaspoonful of powdered ginger, and, in about one hour, one quart of marshmallow infusion—i. e., boil the mallow in hot water until you obtain a strong decoction—and one quart of camomile tea. If marshmallows are not to be had, give large doses of saltpetre; and if the animal is not relieved after eight or ten hours, repeat the above. Give plenty of green food as the appetite returns. This treatment has been quite effective; fully 95 per cent of cases thus treated have recovered. The symptoms, when taken, are restlessness, dull eyes, and moping movements, with an inclination for solitude, constant straining to make urine, and the little voided of bad odor and red in color. The bowels are either very costive or much given to scouring.

"The most important discovery I have yet made concerning the future of thoroughbred cattle in Texas is this: They can, under proper restrictions, be imported and acclimated at not exceeding a loss of ten per cent. This can be accomplished by following the course that we here lay down. If December and January are passed without fever, you can feel safe from its ravages until the rains of spring, followed by the heat of June, when the ticks and vermin menace them. Then avoid exposing them to either rain or sun, and destroy the vermin by a free use of either coal oil or lard, using two parts of the latter to one of the former. If only spring calves are brought there will be less of fever than if older animals were brought. Too many who bring young stock to Texas stint and half-starve them, thinking that to keep them in good growing condition increases the chances of disease. My observation teaches the reverse to be true. To secure a complete development of bone, flesh, growth, and early, profitable maturity, a calf must have generous treatment—plenty of nutritious food, good water and kind treatment. I have heard men complain that Texas Shorthorns were not growthy and handsome, like those exhibited at Northern fairs. The reason for the dissimilarity was readily found, on investigation, to be that the one had excellent feeding and grooming, while the other, in addition to a long winter, starvation and acclimation, with a spring and summer with rain and hot sun, had his vitality almost destroyed by ticks, lice and vermin. Cattle from the North cannot be acclimated unless generous food, comfortable quarters and kind treatment are given to them during their first year in Texas; and unless this treatment be kept up they are worthless when acclimated."

In short, science teaches and experience proves that Texas cattle of ordinary type can be crossed with high-grade cattle, and that if each succeeding generation is bred up, the cross will produce—and, indeed, has produced—in four generations, cattle equal in every respect to the original imported stock. Of course, selections were made by the pioneers in this work with a view to perpetuating, as far as possible, good qualities in native cattle, as well as introducing the far better and more conspicuous advantages of the more costly breeds. The influence of careful selection in this way can be easily appreciated, and the result of it has been that while in some cases a tendency to revert to the original or imported type has been noted, in others there has been an equally marked tendency to improve. In other words, the mere expenditure of large sums of money in importing graded sires, with high records and unequaled percentages of points of excellence, has not in itself sufficed to bring about the desired

results. Eternal vigilance has been exercised by the most successful importers, and the result has more than justified both the expenditure and trouble involved.

The difficulties in the way of introducing high-grade cattle into Texas have been further reduced by the dipping-vat just brought to a state, if not of perfection, at least of practical adaptability. By its use the mysterious "tick," which does such deadly work at times, is reduced to a condition of harmlessness, and one great danger in the matter of graded cattle importation done away with. The main vat in the contrivance referred to is about forty feet long, that being the distance from the point of entrance at the trap or spring-board to the dripping-platform. The vat is made out of cypress wood, two inches thick, with four by four studding. Provision is made for six feet depth of a carefully prepared, chemical dipping fluid, and the sides are extended four feet above the high-water mark, so as to prevent waste by splashing. The bottom or floor of the vat is two feet wide, but the sides taper outward, giving seven feet width higher up, thus preventing trouble from long horns.

Various precautions are recommended. Thus cleats should be nailed to the inclined plane at the end of the vat, so that cattle can walk out without slipping. Cleats should also be nailed on the dripping-platform, so that cattle can stand without slipping. The platform should be enclosed by a good

POLLED ANGUS BULL.

fence, to keep cattle on the platform while the dip drips off and runs back into the vat. The trap-door should be covered with sheet iron, so as to keep it from wearing rough, and it should be fastened over the end of the vat by means of an iron bar, and held under the trap-board by means of strong staples. This iron bar should rest on the end of the vat and pass through the two end studdings of the vat. It should be fastened or placed not quite in the center of the trap-door, so that the weight of the longer end of the trap-board will cause it to drop back level. The chute at the end where the trap-board enters it should be built solid, with perpendicular sides, and not more than one inch space should be left between the sides of the chute and the trap-board, so that the feet of steers can not catch in it.

The vat should be placed into the ground, say six feet, leaving only the sides to project four feet. The plan adopted is useful in separating large from small animals, dipping the grown cattle first, and then, when the dip may be lower, the smaller. Sufficient fluid should be kept in the vat to entirely submerge every animal.

The cattle are driven eight or ten at a time into a small pen, which ends in the chute leading to the vat, and then are driven one after another into the vat. As they step on the trap-door they are plunged into the vat, thus submerging them completely. This is very essential. When the dripping-platform is covered with cattle, they are kept there a sufficient time to permit the greater portion of the

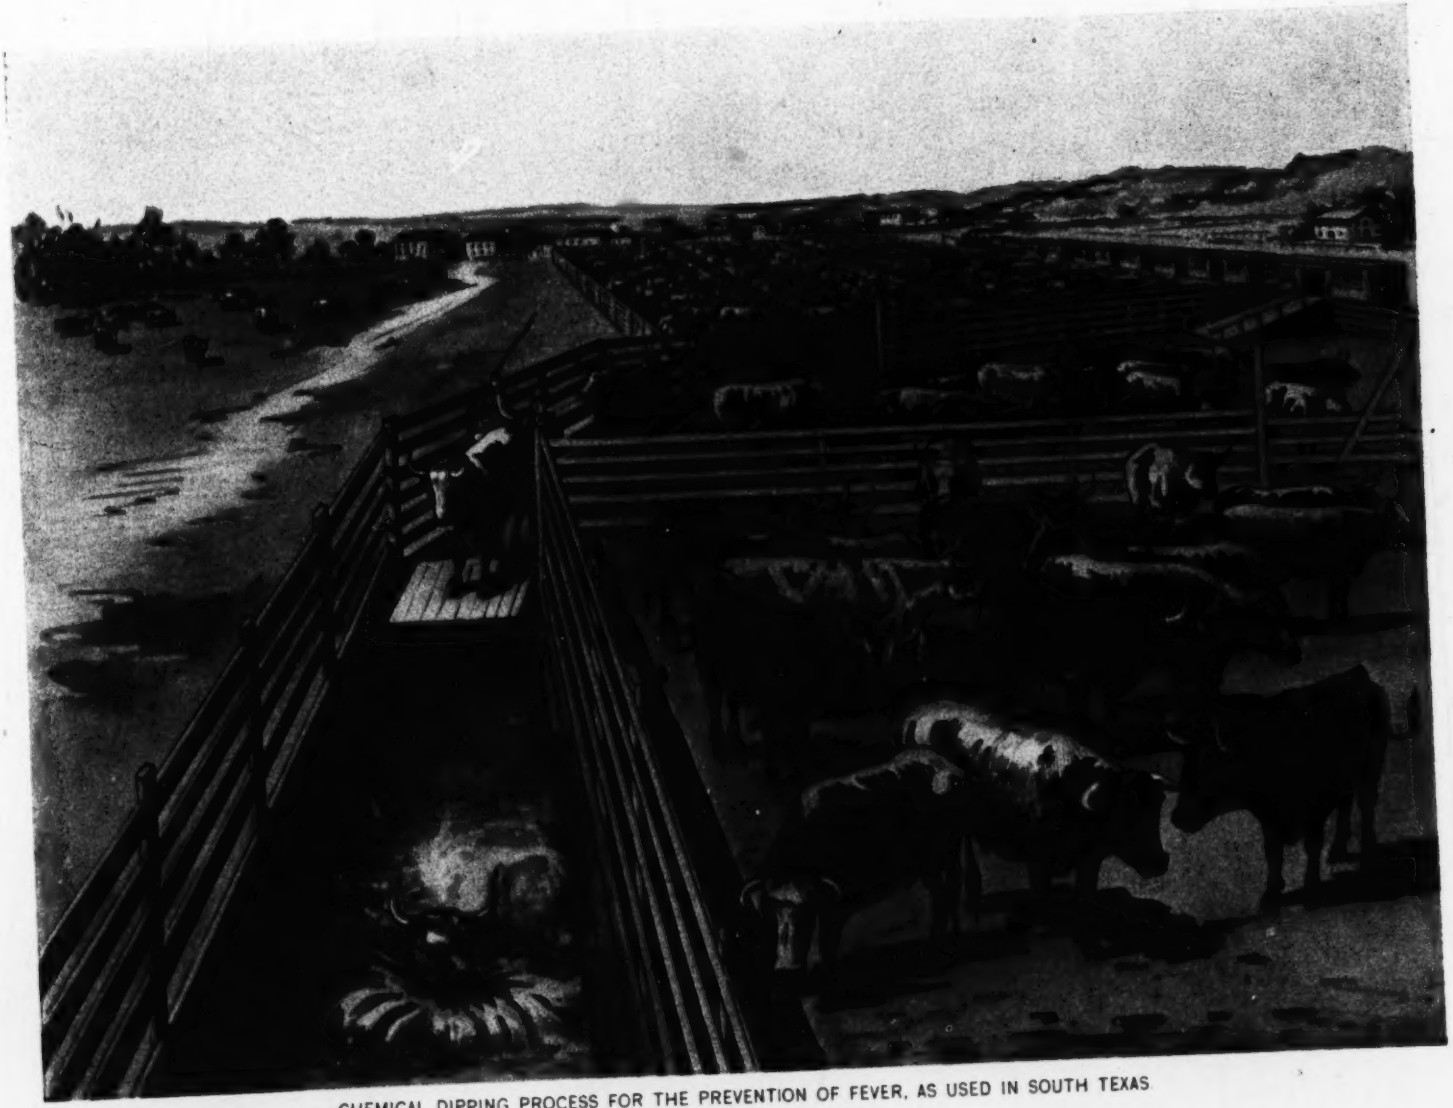
dip to run back into the vat, and then they are turned into the holding pen and another lot passed through the dip. By means of this process cattle are not only freed from lice, itch and ticks, but it is believed that by freeing cattle from ticks they are so disinfected as not to communicate or contract splenetic or Southern fever.

The Shorthorn has perhaps done more toward the improvement of Texas cattle than any other breed. This is a breed of cattle which is appreciated at its full worth in Europe, where the longhorn breeds have been one by one pushed to the wall until now they are seldom found, except in comparatively obscure districts, and occasionally on farms, the owners of which cling to old traditions and believe that an excessively long horn is no detriment. An immense majority of farmers and cattle raisers in all parts of the world regard the long horn as objectionable in a variety of ways. As a weapon it has outlived its usefulness. The wolf and other animal enemies of cattle have been driven back by the same influences which have curtailed the size of ranches and remodeled the entire system of cattle raising. The long horn, which was perhaps an advantage a generation or two ago, is now nothing but a nuisance. In the opinion of eminent authorities, it retards development and fattening, and experiments in dehorning, of which we shall speak later, generally bear out this theory. Long horns, as we shall see later, are also exceedingly objectionable when cattle are being stall fed; a large amount of space being wasted and a great tendency toward injury being the only consequences of their being retained. In shipping the same result is manifested, and short-horned cattle can be transported at less expense and with less risk than the older and now antiquated types.

The idea still prevails that in certain districts the long horned, shaggy coated steer does better than the animal of higher grade. Where doctors differ it is inexpedient to hazard an opinion, but it is sufficient to assert that in these last days of the nineteenth century, the general conditions are such that while there is little money in raising the so-called inferior grades, there is good money to be made out of better bred cattle, and that to a greater extent the shorter the horn, the larger the emolument. The cattle imported into this country during the seventeenth century were of various grades. The Pilgrim Fathers brought with them a number of South of England cows with different characteristics and qualities. The early records of New England speak of the rapid increase in the number of cattle, and in 1627 a writer gave some description of the cattle to be found in what was then the only settled region of this continent. He speaks of them as consisting of blacks, black and whites and brindles, which would seem to indicate that importation had been heavy both from England and the Netherlands. In 1625, as mentioned in a preceding chapter, the Dutch West Indian Company imported a large number of Dutch cattle from Holland, but as far as can be ascertained from existing records, these animals differed very much from the Dutch cattle of to-day, although in some respects they were evidently somewhat similar. Certain it is that they brought with them comparatively short horns and thick bodies, capable of putting on an immense quantity of flesh. Two hundred years later Dutch cattle were imported much more freely, and the influence of the more recent importations has been very freely felt. These Dutch cattle are probably the result of more careful breeding up than any other in existence, with the possible exception of the regular short horn. Prof. Hengerfeld, of Utrecht, says of this breed:

"It may be taken for granted that the Dutch cattle trace their pedigree from the time when the Friesians and Batavians settled on the banks of our great rivers, about one hundred years before our era; they are the lineal descendants of that race of cattle. These nations were engaged in fishing and attending their herds when not compelled to serve under the Roman standards. The nature of the soil at once indicated their system of agriculture, which was very plain and rude, their object being to get as much milk and beef as possible, while the hides of their cattle were used for garments. Under the Romans, who could boast of a more regular system of husbandry, they improved their farms and the feeding and management of their cattle. These improvements were entirely founded upon the Roman system. Several large farm houses remain at the present time as evidences of that ancient system. The old castle, with its various stables, was surrounded by kitchen gardens, woods, meadows, orchards, duck ponds, moats, canals and ditches, by farm houses with their cow houses and barns, while the whole was enclosed when possible with some branch of a river.

"This is a picture of an ancient Roman villa, with its surroundings. It is true, from that time up to the present, many changes have been effected and the estates are less extensive, but in the main



CHEMICAL DIPPING PROCESS FOR THE PREVENTION OF FEVER, AS USED IN SOUTH TEXAS

(For description, see page 199.)

everything shows an exact imitation of the Roman villa. Observing these things, we conclude that during many centuries the loading, management, and methods of turning cattle to good account, have undergone little, if any, change. A continual crossing of the same breed, with little importation, or mixing with foreign animals, causes the original race to remain unaffected by foreign influence. Only in the northeastern and in the southeastern borders of our country do we meet with crosses of the German and Flemish cattle."

Most of the Dutch cattle imported into this country two hundred and fifty years ago were white, or white and spotted. Their horns were generally curved upward, and were quite short, although not perhaps so short as what is considered strictly the proper thing to-day. Dutch cattle were recommended at that time chiefly because of their exceptional milking properties. Early records show that they also brought with them a high reputation for size and weight. Many of these Dutch cattle have drifted into Texas, and where this has not been the case, direct Dutch blood has found its way South in a less direct manner.

It is difficult to ascertain from authorities exactly when the Shorthorn itself was first introduced into this country. Its history goes back an immense number of years, there being records of the appreciation of this breed in Europe antedating the Norman Conquest; or in other words, prior to the commencement of the eleventh century. They are believed to have been imported into England by the Danes, and certain it is that they made their way rapidly into popular favor. The Old Dominion is mentioned as having received and raised the genuine Shorthorn prior to the commencement of this century, and quite a large number were kept in Virginia and appeared to thrive excellently on the pastures and in the climate of that State. Very early in the present century a number of Kentucky breeders sent agents to Europe and purchased the highest-grade Shorthorn bulls that could be found, and in 1840 there are records of their successful importation into Ohio. In 1850 they went still further West, and before the outbreak of the war they found their way into Texas.

Cattlemen who have given the question very careful attention name the year 1870 as the first one in which methodical importation of Shorthorns into Texas for the purpose of improving the native breed of cattle commenced. From that time forward the experiments have been continued so steadily that they are really experiments no longer. A special characteristic of the Shorthorn sire seems to be to transmit to his progeny his special characteristics, including short legs, immense bodies, and other equally valuable features. The best description of a Shorthorn yet published is the one given by Mr. Allen in his work on "AMERICAN CATTLE BREEDS," and this is reproduced to show how very rapidly the principal characteristics have been transmitted in Texas, and how the Shorthorn has improved the grade of stock kept.

"The muzzle," says Mr. Allen, "should be fine and yellowish, or drab in color, not smoky or black; the face slightly dishing or concave; the eye full and bright; the forehead broad; the horns showing no black except at the tips, and standing wide at the base, short, oval-shaped, spreading gracefully out, and then curving in with a downward inclination, or turning upward with a still further spread (as either form is taken without prejudice to purity of blood in the animal), of a waxy color, and sometimes darker at the tips; the throat clean, without dewlap; the ear sizable, thin, and quickly moving; the neck full, setting well into the shoulders and breast, with a slight pendulous hanging of the skin (not a dewlap) just at the brisket; the shoulders, nearly straight, and wide at the tops; the shoulder-points, or neck-vein, wide and full; the brisket broad, low and projecting well forward, sometimes so much as to almost appear a deformity; the arm gracefully tapering to the knee, and below that a leg of fine bone, ending with a well-rounded foot; the ribs round and full (giving full play to vigorous lungs), and running back well toward the hips; the crops full, but, as a rule, scarcely equal in fullness to the Devons; the chine and back straight from the shoulders to the tail; the hips uncommonly wide, and level with the back and loin; the loin full and level; the rumps wide; the tail set on a level with the back, small and tapering; the thigh full and heavily fleshed; the twist wide; the flank low and full; the hock, or gambrel joint, standing straight (as with the horse), or nearly so; the hind leg, like the fore one, clean and sinewy, and the foot small.

"The true colors of well-bred Shorthorns range from pure white to deep red; and between these colors, either of which frequently comprise the whole animal, their intermixtures in all variations of

roan—as light roan, with the white predominating over the red; red roan, with the red prevailing over the white, as either may over the other in different degrees; red and white flecked, or spotted in every possible way. The red may also vary in shade from light, or yellow red into the deepest mahogany. The old-fashioned Shorthorns sometimes showed a drab dun, or fawn color, mixed with white, which we have in some instances seen crop out in one of later days. We have also seen a very few instances of dark-brown roan, almost smoky in shade, among those of excellent quality and unimpeachable pedigree. But the clear white, and full red colors, either by themselves or intermixed in various beautiful and picturesque proportions, are the prevailing colors of our own time."

Shorthorns have the reputation of being the best milkers known; but it is rather as beef producers that they are popular with Texans. All authorities agree that no breed has a greater capacity for putting on flesh than the Shorthorn, and experience in Texas has proved that the first cross between Shorthorn and native cattle will weigh at least 200 pounds more than a native steer at the same age, with the same amount of food. Careful inquiry among a number of ranch owners, who have gone to the expense of importing or purchasing cattle of this variety, indicate that steers at three and a half years average in weight from thirteen to fifteen hundred pounds, according to the amount of Shorthorn blood in them, and the conditions under which they have been raised and fed. This is a gain of from twenty to twenty-five per cent: and an additional advantage in favor of this breed is found to be that it matures very early for slaughtering, and also that it thrives equally well on abundant grass as on stall feeding.

The Polled Angus was introduced into Texas shortly before the Polled Durham. The Polled Angus is a much older variety of cattle. Twenty years ago it was acclimated in Kansas by Mr. Grant, whose name is so honorably connected with the improvement of the cattle of the West and Southwest. The extraordinary success which attended his experiments resulted in a very general importation of these splendid animals, which have for many years been exceedingly popular in Great Britain and Scotland, and where they have made their influence felt in a most significant manner. Mr. George W. Curtis attributes to Mr. Hugh Watson, of Keillor, Scotland, the credit for inaugurating the movement which has resulted in the general improvement and grading up of this choice breed of cattle. Its predominating color is the blackness of the night. According to Mr. Curtis, Mr. Watson commenced his work almost with the present century. Selecting the blackest of the black, and the best of the best, he commenced to breed for points, and every generation carefully excluded every animal which showed a tendency to revert to inferior characteristics, or which did not please him in every detail. Desiring an animal which would range well, and keep in good condition on exclusive grass feed, he laid this down as one of the characteristics to be sought after, and before he had completed his work he had established a standard of excellence which it would be very difficult indeed to improve upon.

Prejudice was created against this breed about twenty years after Mr. Watson commenced his efforts, but fortunately a reaction set in and the popularity has continued to increase ever since.

The Earl of Airlie, who is an enthusiast on the question of cattle raising, has placed himself on record concerning this breed, in the following terse narrative and personal experience:

"I have at present seventeen pure Polled Angus milch cows in my dairy. The greatest number of these give from twelve to fourteen, and sometimes sixteen, Scotch pints for a considerable time after calving. The milk is admitted to be much richer than that of either the Shorthorn or the Ayrshire. As regards the length of time for which they will continue to give milk, my cow Belle of Airlie (1,959), dam of Bellus (749), as pure a Polled animal as any in the herd book, used to be milked all the year round. Last year, when I was from home, they left off milking her about a month before she calved, and she died of milk fever, induced, as I believe, by the circumstance that she had not been relieved of her superabundant milk. The cow Miss M'Pherson (1,252), of the Erica tribe, which I purchased recently of Mr. Adamson, is now giving six Scotch pints a day, more than nine and a half months after calving. The dairy cows referred to were selected by me with a view to their milking qualities; and whenever I found the produce turn out bad milkers, I drafted and fed them for the butcher, except in a few instances, when, from their shapes and blood, I thought them likely to produce a valuable tribe of cattle."

We have already spoken of the early experiences with these cattle, and it was within ten years of their establishing themselves on American soil that they became introduced to anything like a general extent into Texas. As to whether they have become popular in the great Lone Star State, the color of the cattle on the pastures and in the stalls is the best exponent. As the visitor to Texas or the Indian Territory is whirled across the country in the cars, he occasionally observes grazing near the track large coal-black cattle, absolutely hornless. The animals differ so materially in blood and appearance from the native herds that no difficulty whatever is experienced in detecting their presence, and even the first cross has such a marked effect on color, texture of the hair, length of hair and general formation, that if the good work could be left in that stage, nearly all that could be desired would have been accomplished. But it is a law of nature that there must either be advance or retrogression, and hence it is that Polled Angus Texas cattle must either be steadily bred up to the Polled Angus standard, or they will, in the natural course of events, degenerate and reproduce in more distinct fashion, in every generation, the long horned, shaggy wool characteristics of the old Spanish type.

It has been stated with considerable force and repetition that the Polled Angus does not acclimatize well in what has been described as the Southern fever belt, an expression to which the Texas cattlemen naturally take exception. It is obvious that a breed of cattle coming from the mountainous regions of Scotland requires exceptional care when introduced into a flat country; but experience has shown that with care, and by taking the precautions already referred to, the Angus can be thoroughly acclimated to Texas with but a reasonable percentage of loss in the original importations. The Galloway, which resembles the Angus in color but differs from it in other important respects, takes to Texas more readily. It is scarcely so suitable, however, for breeding up cattle of a Spanish type, because it has a natural tendency to shaggy hair, and when bred with native cattle this objectionable feature, which can be overcome in pure breeding, is apt to make itself very apparent. The Galloway, like the Angus, is pure black, but the long, shaggy hair of the former has about it a brownish tint which is entirely absent in the Angus, whose color is glossy black. The hair of the Angus is exceptionally short and lies very closely, giving to the animal a symmetrical appearance and bringing out prominently all the magnificent features of its build and frame.

The Angus attains to a large size, frequently exceeding two thousand pounds, and the result of a first cross with Texas cattle has been an average increase in weight of more than a hundred pounds at three or four years. The second and third generations show an immense improvement upon this, and where breeding up with this variety of cattle has been persevered in, the general improvement has often been much more marked. Not the least important point of excellence resulting from this cross is the rapid extermination of the horn. Neither the Galloway nor the Angus has even the suspicion of a horn, or the hard bony substance which is frequently found in animals which have been dehorned by breeding and not by aid of the saw or other tool. A number of breeders who were questioned on this subject, expressed the opinion that the Angus was by long odds the most suitable animal to use for improving native Texas cattle, and although it is difficult to state definitely why this is the case, it is safe to assert that although some of the early experiments with this breed proved very costly, the result in every case has justified the attempt. Texas cattle raisers as a rule do not breed for what may be termed "show points," but rather strive for those characteristics which tend to make cattle-raising more profitable, such as early maturing, increase in the weight without corresponding increase in feed, and general healthiness and hardiness. Hence it is that a great many experiments are tried which would not be regarded as strictly legitimate by those who make a specialty of strictly pure blood in cattle, and these experiments have been generally, if not uniformly, successful in herds where Polled Angus blood either predominates, or is present in sufficient force to make its influence plainly felt.

During the last ten or twelve years a still further advance has been made in the way of introduction of specially suitable blood for the improvement of Texas cattle, by the importation of several Polled Durhams. This is a very much younger variety of cattle, and is really a member of the short-horned variety. It is only during the last five or six years that the breed has been recognized as a distinct one, but there are now certain well-defined points in regard to it which make it even preferable to the Shorthorns for the purpose under discussion. Unlike the Shorthorn proper, it is, to a great extent, an American production. It is, in fact, the result of a cross between the best imported Shorthorn bulls

and native cows. The latter were mostly selected from herds in the central and semi-Southern States, and the work was persevered in until what may be termed an entirely new breed of cattle was established.

The Polled Durham is found at its best in Ohio and Illinois, where it is bred for points. It has climatized well in Texas, and in eight or ten different counties it has been introduced with great success. The main point in which the Polled Durham differs from the Shorthorn is in the fact that it is absolutely hornless. In general characteristics it resembles the Shorthorn, and is fully as large as the best breeds of that justly-prized variety. Several bulls have turned the scale at 2,300 and 2,350 pounds, and the cows vary in weight from 1,200 to nearly 1,700 pounds. There is no tendency whatever to the production of horns, and this increases the symmetry of the head and the rotund appearance of the neck. The legs are short, thickset and sufficiently far apart to enable the immense weight of the body to be carried steadily, and without any of the unsteady motion in walking which is so often the case in cattle of the lower grade, which are abnormally fat and heavy. The body is almost perfectly round in the matured, well-conditioned Polled Durham, and the shoulders are exceptionally powerful in both sexes. Being in themselves the result of a cross between imported and American

A MODEL HEREFORD.

cattle, they cross with great advantage with high-grade Texas cows, and indeed some of the best bred-up cattle on the Texas plains possess many of the Polled Durham points, so much so, indeed, that in one generation of interbreeding an almost perfect Polled Durham is produced.

A journey through Texas, such as was taken by the writer more than once while preparing this history and collecting information, discloses the fact that the Polled Durham, in spite of its youth, has made its influence felt to an exceptional extent in a great variety of localities, and that it is drawing attention in a most satisfactory manner to the value, and indeed necessity, of not depending entirely upon the native or Spanish grade of cattle.

Mr. Walter B. Stevens, in the course of his exceedingly interesting and instructive series of letters on Texas, contributed to the "ST. LOUIS GLOBE-DEMOCRAT," describes the herd of Galloways which he saw on the famous Sanborn ranch. Weaving an historical romance around this ranch, Mr. Stevens explains how Mr. Henry B. Sanborn, of New York, located in Texas in 1875 for the purpose of introducing barb wire of a special brand. Becoming infected with Texas fever of a different character from that described elsewhere in this work, the New York gentleman purchased a small tract of land, and kept on adding to his ranch until it exceeded ten thousand acres in extent. Not long after taking up with this new enterprise, Mr. Sanborn secured some pure bred Galloways, described by the writer

already quoted as "short legged, long hair, black as the wax soil after a wetting, hornless, shaggy headed." Supt. Shero of this ranch is quoted as saying: "The Shorthorn will get discouraged when the season is bad. He must be helped out with a little feed. The Hereford will hump up and lose flesh when the cold strikes him. But the Galloway will keep going and hunting something to eat. After the hard season the weaker of these herds will get down in the mud sometimes, and won't have ambition enough to get up again without help. You never see a Galloway get in that fix; he is always able to take care of himself. That is one of the big points in his favor for Texas." Mr. Stevens goes on to write in his usual entertaining manner. "On the Sanborn ranch black cattle are not raised for beef. The strain is too fine and expensive. Thoroughbred Galloways are grown and sold to head the herds of Shorthorns and Herefords on other ranches. The cross gives the breed which finds its way into market. It produces an animal with finer hair, longer legs and greater weight than the Galloway, but the strength of the strain shows itself in the black hide and the horuless head.

"The short legs and big bodies make the Galloway the most deceptive looking of 'cow brutes.' On the Sanborn place it is very easy to get a bet on the weight of a given Galloway, and it is easier to lose it. Once upon a time Dr. Grant, of Sherman, a man with a fund of information on Texas horses and Texas cattle, encountered the deception. He had a dispute with Mr. Sanborn about the weight of a young Galloway they had been looking at.

"'I'll bet you a hat you can't guess the weight of that brute within three hundred pounds,' said Mr. Sanborn.

"The Doctor smiled sarcastically, looked the Galloway up and down and from end to end. 'Six hundred pounds,' he said.

"That evening the bet came up for further discussion at the house. Supt. Shero, when he heard of it, said to the doctor: 'I'd like to bet a hat that it is a bad bet, Doctor.'

"Dr. Grant tapped his thinker, and with increased sarcasm, said: 'This head might be found in a penitentiary, but never in an asylum.'

"The boys were told to cut out the particular Galloway and get him on the scales. He weighed eleven hundred and thirty pounds. Dr. Grant looked at the indicator and then at the brute. 'I wouldn't have believed there could have been so much meat in that much hide,' he said.

"When the artist caught the Galloways for the illustration, they were bunched together so closely that their sides rubbed. The bunch was making the double motion of the funnel-shaped cloud. The individual brutes were moving round and round in a close circle, and the bunch itself was drifting slowly along the wire fence, all grazing.

"'You'll have to get 'em quick,' said Mr. Shero from his horse, 'or they'll be off,' and so the drifting, and at the same time revolving, bunch was caught on the double movement, with heads and bodies and tails all mixed up. 'That's the way those brutes feed; close together, just as you see 'em,' Mr. Shero explained. There is no other cow native on the broad Texas prairies quite like the Galloway. The Polled Angus are somewhat like the Galloways in appearance. They are black and hornless, but they have longer legs, finer hair and more range of body. That is where the Durham blood comes in. Mr. Sanborn says the Polled Angus is a breed made originally by crossing the Galloway and the Durham. The Galloway thus described is of very old breed, its history extending back into the early part of the sixteenth century. In the section of Scotland from which they took their name there is a legend extant that there never was a time when this characteristic breed was not found in considerable numbers in Southwest Scotland. It is interesting to know that in these descriptions, now nearly three hundred years old, the main features of the breed are described almost in the same words as used now. Although the animal has steadily improved during the last two centuries, the improvements have been steady rather than spasmodic or essential. The original color was dun or drab, and although at the present time, and indeed as far back as can be remembered, black is a prevailing color, there is an occasional tendency to lapse back into what was probably the original color."

The Galloway is essentially a hornless beast. Even the mark of a horn is regarded as a disqualification in a contest for points. The color, as already mentioned, must be black, although a brownish tinge is unavoidable in extreme winter. The head is short, with a full forehead and wide nostrils, and

the body is round and long, with the back as straight as a well-planed board, the proportion of live weight very high, and as range stock the Galloways are without superiors for hardihood and ease of handling.

So strong is the anti-horn tendency that the introduction of Galloway blood into herds of native cattle results in at least four-fifths of the calves being born without horns. The Galloway is also an exceptionally heavy animal, with weights varying from twelve hundred to two thousand pounds. The breed is exceptionally valuable in a number of ways, and it has been found that they acclimatize in Texas very easily indeed. The percentage of loss is small, and the percentage of gain from the introduction of the blood is enormous. These results make the demand for full-blooded Galloways very high, and on many ranches they are bred exclusively for stock purposes.

The Hereford is another animal which has contributed very largely towards the breeding-up of Texas cattle. It is usually of a dark red color, with a white face. So far as horns are concerned, the Hereford is less satisfactory than the Galloway, although it seldom has very long horns. It is the frame of the Hereford which popularizes it among ranch owners. It is, to use Mr. Curtis' description, "blocky, square built, with rather short legs, and all back points full rounded. The tail drops squarely, the quarters are heavy, muscular and low down on the hocks, and the head and neck are short and close fleshed; in fact, the whole make-up of the animal indicates strongly the mark characteristic of the beef-breed."

The Hereford was first introduced into this country about eighty years ago, and Kentucky was the first State in which it was located. A few years later large importations were made into Eastern States, and during the last ten or fifteen years, several hundred highly-bred Herefords have been located in the Pan Handle. Large numbers have also been placed on the irrigated lands of Arizona, and unique success has attended the efforts of importers and breeders.

In some respects the Jersey cow does not commend itself to the Texas ranchmen, because it is rather for its dairy than its beef excellency that this aborigine of the islands in the English Channel is celebrated. At one time there was practically no distinction between the Jersey, Guernsey and Alderney breeds, but during the last half century they have been absolutely divided, and now the characteristics are very different. The influence of the Jersey on softening the hard lines of the original Texas steer has been marked. Strange to say, the Jersey is a very distantly removed cousin of the long-horned animal, which used to roam wild over the plains of Mexico and Texas. The same color seems to predominate in the two breeds, and there is also distinct in both the characteristic mealy color ring mark around the nostrils. Mr. Curtis and other authorities attribute this birthmark to Spanish regions, and the short distance between Spain and Jersey makes it exceedingly probable that the Jersey originally came from that once great cattle country.

There is something essentially deer-like about the Jersey. Its neck is thin and long, and its body is deepest at the flank, representing a "V" shape, which, with milkers, very often tends to leanness and fishback form; but with fat steers this is practically done away with. The Jersey does not acclimatize so easily as some other breeds of cattle, but as soon as it is thoroughly introduced it makes its influence felt and becomes of great value. When the vast importance of the dairy interest in Texas becomes to be thoroughly appreciated, those who have gradually introduced Jersey blood into their stock will reap a rich reward for somewhat anticipating public opinion, and flying somewhat in the light of popular sentiment.

It is strange, in view of the obvious advantage of hornless cattle, and of the general tendency toward reducing the length of the horn, that of late years Devons have been more popular for improving the native stock than any other variety of cattle. Hence, the deep-red color so frequently seen in the heavier beasts sent to market. There are hornless Devons, but, as a general rule, the Devons have a longer horn than the average short horn, and this, perhaps, is the only drawback to their general use in Texas for purposes mentioned. On the wide, bleak, and often foggy flat ground of Devonshire, England, and on the wild hills of Wales, these animals have been equally at home, and have stood the variations of soil and climate with marked and remarkable success. On being introduced into Texas they acclimated quicker than any other cattle and speedily became uniquely popular. They were first introduced into this country in 1623, but the first grade Devons came over within the last eighty years.

It is only necessary to give a brief description of the Devon to show the reader how quickly it has stamped its peculiar characteristics on the cattle of Texas. The color is a rich deep red throughout, excepting the central tuft of long white hair in the brush of the tail, and a white spot on the udder in cows, and about the purse in bulls. Upper line almost perfectly straight from the head to the tail; in the bull the neck is, of course, somewhat arched above this level. The head is neat and trim, rather long in the cow, but short and massive in the bull, and well pointed to a well flesh-colored muzzle; eyes prominent, bright, wide apart, and encircled by rings of flesh-colored skin, horns rather long, slender, curving outward, forward and upward, waxy clear at base, and tapering to almost needle-like points of darker shade. The ear is sprightly; neck small at head, without dewlap, and full and broad at the shoulders; forequarters wide apart, showing good lung power, and slanting well back, a feature in strict keeping with their well-known activity. The barrel is round and close-muscled; loins even; hips square; rump smooth; tail long, slender and invariably tipped with white; flank long cut; brisket deep, and legs short, straight and clean-fleshed.

We believe the above to be a just and fair description of the breed as now known in the United States, and to show the improvement which has taken place, we quote the following from "Low's Domestic Animals of Great Britain," previously quoted, and published in 1842.

"Although the Devon ox presents a symmetry of parts which pleases the eye, yet his form is not precisely what the breeder seeks for in an animal destined to fatten quickly and arrive at great weight. His neck is too long, his chest too narrow, his sides are too flat, his limbs too long, in proportion to his body; or, in other words, his body is too small in proportion to his height. The Devon ox is a kindly enough feeder, but he requires good pasture, and a somewhat favorable climate, and could barely subsist on food which would suffice to fatten some of the hardier mountain breeds of nearly his own size."

Probably the most prominent trait of the Devon is his sprightly energy. In the early days of the present century, when the fertile prairies of the Great West held their virgin soil unbroken, the farmers of New England found abundant exercise in removing the stones, stumps and saw logs with which their land was covered. For this purpose oxen were employed almost exclusively, and the grades from those early imported Devons were eagerly sought.

As work oxen, the Devons have no superior in the world; they lack, perhaps, the weight necessary to move enormous loads, but their remarkable quickness, combined with an intelligent observance of the driver's will, make them invaluable for work of certain kinds. For beef, little recommendation is needed; the improvement of the breed has with many breeders, been almost entirely in this direction. Allen, speaking of the excellent milk qualities of the cows in a herd of Devons owned by him, says:

"It is but fair, however, to state that after we commenced crossing our cows with bulls of later importation some fifteen years after the commencement of the herd, the large milkers were not so numerous, although the cattle from these crosses were somewhat finer. The bulls we used were apparently bred from stocks highly improved with an effort more to develop their feeding properties than for the dairy."

"The Devons," concludes Mr. Curtis' description, "are probably as nearly general purpose animals as may be found among the present known breeds. In size, the medium bulls, when matured, weigh from twelve hundred to sixteen hundred pounds, and cows from nine hundred to eleven hundred pounds. One thing more we must notice—their introduction into the Southern States. In Mr. Allen's work, the author intimates that the Devon acclimates unusually well in the South. We cannot agree with him. Information from various portions of the South has shown a high proportion of mortality among Devons brought from the North, only one breed (Shorthorns) showing a greater average per cent of loss. To counterbalance this, however, it is a well-known fact that the Devons when acclimated will thrive and keep in good condition on scant pasture, where many other improved breeds would starve to death. This high per cent of mortality in acclimating Devons may be due to the unnatural forcing which the breed has undergone of late years in the hands of unskillful breeders, as it is well known among successful importers of Northern cattle that the introduction of overfed or pampered stock from the North is apt to result fatally to both profits and cattle. There are now a good number of fine herds of Devons in the South, and their certain increase, both in numbers and favor, is fast becoming an accomplished fact."

The writer's observations, backed up by the opinions of at least a score of prominent breeders, go to show that so far as acclimating is concerned, Mr. Allen is right and Mr. Curtis wrong. Of course, there have been heavy losses on certain ranches, but these have been the exception, and not the rule.

Although, as already stated, the improvement in the grade of cattle raised and fatted in Texas has been most marked during the last ten or fifteen years, it is interesting to note that a quarter of a century ago the importance of the question was realized by some breeders and raisers. In the biographical section of this work, credit is given to a number of individual cattlemen whose enterprise and foresight resulted in pecuniary benefit to themselves and a vast increase in the value of their herd. Mr. McCoy, writing more than twenty years ago, when almost every well bred beast was called a Shorthorn or a Durham in the Southwest, says:

"The Durham or short horn cattle raised and fed so extensively and profitably throughout the Northwest, are in almost every respect more valuable and profitable stock than the long horned to breed and handle. The Durham blood is sought by breeders, and of late years shrewd enterprising Texan ranchmen have been sending young graded Durham bulls to their ranches for the purpose of improving their stocks in blood and quality. They plainly see that Texas must improve her cattle in blood and quality if she would longer compete successfully and profitably in the beef markets of the Union. It is beginning to dawn upon the understanding of the Lone Star ranchman that his only hope, as well as imperative duty toward himself, lies in improving the blood of his stock, even at the expense of numbers.

"While it is a well established fact that Texan cattle can be fatted upon corn, yet it is not so easily or successfully done as with the Durham, although it is quite as well established that Texan cattle will fatten better on grass than the native or short horn. Now, inasmuch as corn-fed and corn-fatted beef invariably brings better prices than the grass-fatted, it becomes a matter worthy of note to the producer, to secure such grades of cattle as will make the most valuable beef. It is also an item worthy of consideration to the ranchman, to breed that class or grade of cattle which the corn feeder desires, and for which he will always pay good prices.

"In Colorado it is made, by statute, a punishable offense to permit a Texan, or scrub bull, to run at large, and ranchmen are authorized to shoot down such whenever and wherever they may meet them upon the commons. This law, in connection with the private enterprise of her ranchmen, is fast changing the form and appearance of Colorado native cattle. Indeed, it is astonishing, as well as highly encouraging, to note the marked improvement in color, form and weight, arising from a cross of Texan cows with Durham bulls, although the latter may be common grades only. In many instances the ordinary observer will scarcely believe, or recognize that the cross, or half-breed, has any Texan blood in it. But little trace of the mother is transmitted to her offspring, which sell upon the Eastern markets quite as well as other Durham grades of equal fatness bred in the Northwest.

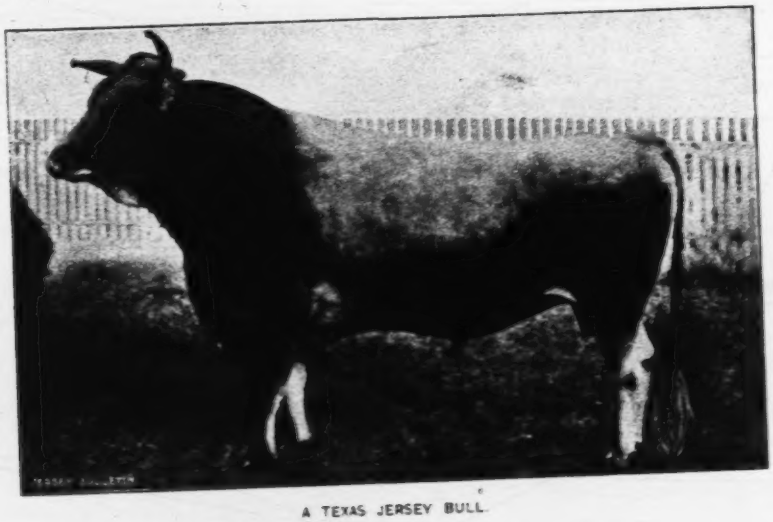
"There is nothing else which holds out the hope and sure promise of so great reward for the investment to Texan ranchmen, as the crossing of their cows with grade Durham bulls. If the cattlemen of that State would import one car load of yearling bulls, of Durham blood, for each one thousand head of cattle they export annually, the lapse of time would be brief before a marked difference would be seen in the quality of their stock and the prices realized for Texan cattle. It is to be hoped that the ranchmen of that State will speedily realize the importance of improvement in blood of their herds.

"The great number of Texan cows and heifers that have been placed upon ranches throughout the West, coupled with the irrepressible desire for improvement, has given considerable impetus to the breeding of thoroughbred and grade bulls throughout the Northwest, and especially in the country adjacent to Kansas City. The interest in thoroughbred Shorthorn cattle continually increases, as is plainly indicated by the sales that have occurred during the year of 1873. The demand from Colorado and Western Kansas for superior bulls has been, and still is, large."

Mr. McCoy attributes special credit for the introduction of Shorthorn cattle into the Southwest to Mr. Andrew Wilson, of Kingsville, Kansas. At the time he wrote his "SKETCHES OF THE CATTLE TRADE," Mr. Wilson had an exceptionally large herd of graded stock. He had taken a large number of first premiums at Kansas State fairs, and as a successful breeder of pure blood cattle, he had established a high and enviable record. During the summer of 1873 Mr. Wilson's herd became so large

that a public sale was determined upon, and the amount received in two days was twenty-four thousand dollars, some animals fetching more than a thousand dollars each. "This result, says the author already quoted, "caused so great and growing a demand for blooded bulls to be placed upon cattle ranches in Texas and the Indian Territory that the business of producing full bloods and grades is becoming (1873) very large and lucrative."

Since this was written the value of blooded stock has increased enormously, and those who anticipated the demand have made an immense amount of money as a result of their enterprise. Mr. McCoy's description of the way Mr. Wilson conducted his operations twenty-two and twenty-three years ago shows, that during the winter of 1872 and 1873, he "roughed about five thousand head of Texas cattle through the winter, and fatted them the following summer on grass. Not content with the magnitude of this operation, the following fall season he formed new business alliances, bought seven thousand five hundred head of Texas cattle at panic prices and put them into winter quarters near Topeka. His chosen method of handling Texan cattle is to winter them principally upon corn-stalk fields, which he buys in great abundance at low prices, usually from twenty to fifty cents per acre, after the corn has been gathered therefrom. Upon these fields the cattle are turned in herds of one to five hundred head. As soon as one field is depastured, another is provided, so that the labor of feeding or caring for the



A TEXAS JERSEY BULL.

stock is small and light. When the approach of spring is near, it is found to be good practice to feed corn for several weeks, so as to strengthen up the stock and start it to improving in flesh and heart, so that when the new grass comes in the spring the cattle fatten rapidly and without delay, or loss from death, as is often the case when the animal is poor and weak in flesh. This style, or manner of wintering cattle, is called 'roughing,' and the feeding of corn in the spring is termed 'warming up.' It is one of the most successful and profitable methods of handling Texan cattle. Inasmuch as little or no loss by death ever occurs it is economical—especially when the corn crop of the region has been good, and, as a natural result, the stock fields abundant, good and cheap. It is claimed that by roughing through the winter, the cattle can be made fat upon grass at an earlier date, and be ready to go to an earlier and better market than by any other method of wintering. In Central Kansas by far the larger portion of the corn crops are harvested by husking, or snapping the corn from the stalk, leaving the immatured ears or nubbins on the stalks with the fodder. These make good feed for the stock-steer, upon which he thrives so nicely, so long as he is able to get sufficient thereof. When spring comes and the natural grasses become abundant, the cattle are taken from their winter quarters, and in herds of five hundred or less, are herded until fat, which requires from two to five months' time. Cows and young cattle get fat much quicker than aged steers. A great gain both in weight and value is thus secured."

Even earlier than this, isolated instances of the importation of high-grade stock are recorded. Mr. Kuykendall, from whose reminiscences we have already quoted at some length, says that during the first part of the war he received his first object lesson in the great superiority of the improved breeds over the native scrub stock. "In the adjoining stalls to which my cattle had been assigned on sale," he writes, "were placed an assignment of stall-fed high-grade Shorthorn beeves—magnificent specimens of the bovine race. I stood by during the progress of the sale, an attentive and deeply interested observer. My cattle brought from $17 to $24 per head gross, while the Shorthorns brought the handsome figures of from $80 to $125. This practical demonstration of the value of improved blood made a lasting impression on my mind, and offered an irrefutable argument against the inexcusable folly of breeding scrub stock."

Times change, we are told again and again, but the logic of high-grade cattle as against "scrub" stock remains the same to-day as the observant writer we quote noted it nearly thirty-four years ago.

We have seen, in brief, the characteristics of the principal breeds used during the last quarter of a century, and more especially during the last ten or twelve years, for the purpose of improving the breed of so-called Texas cattle. The name has not changed, but the appearance of the average beast sent to market has been almost metamorphosed. We have seen, in outline, how the results have been achieved, and how the long dangerous horn has been relegated to obscurity, its place at the worst being taken by a horn so reduced in size as to be comparatively innocuous.

To gather anything like an adequate idea of the results achieved, one must look over the ground both at the points of feeding and raising, and of selling. He must then cast his mind back a few years and contemplate the difference and the advance. Or he can spend a few hours at the stock yards of either Chicago, St. Louis or Kansas City. When a bunch of unhappy-looking animals, short in weight but long in horn, makes its appearance, he will be told by the habitue of the place that they are from the extreme South of Texas, where there has been little or no change in the grade of cattle. When, a moment later, a bunch of heavier, shorter-horned beeves make their appearance, he learns an object lesson in the effects of breeding-up, and if he cares to follow the question a step farther, he learns that the latter bunch sell quickly at about fifty per cent higher prices than those at which the long-horned rough-coated antediluvian animals go begging, perhaps for a day or more.

As a matter of fact, the advantages of breeding-up are so great that they can scarcely be reduced to the region of dollars or cents. Nor can it be said the investment of the importers is bread cast upon the waters to return after many days. The paramount importance of producing a higher grade of beef is being fully recognized, and even were the present the one time to be considered, the importance of the introduction of better blood would be easily appreciated. A contributor to one of the Eastern papers, following this subject up, says with much force: "Unfortunately, the butchers have not yet sufficiently divided their customers into two classes, and they consequently mix them. It is largely a lottery to go to a butcher and expect to get good meat. He has in stock good, bad and indifferent meat. He sometimes does not take the trouble to notice which is tender and which is tough. The buyer pays as much for one as for the other. Probably in many cases the retail butcher has done the same. There are no doubt many poor people in the cities who would buy more tough meat if it were cheaper, and many well-to-do classes who are anxious to get meat that is guaranteed at all times to be tender and juicy. The present mixed-up state of affairs does not do justice either to the consumer or to the grower of meat. The former should insist more decidedly upon good meat, and if it is not given, refuse to pay the full price for it. In this way we would soon have a class of butchers who would deal only in superior beef. Their customers would take nothing else. The poorer customers would be benefited by this, because their tough meat would be proportionately cheaper. In the wholesale markets, poor Texas cows sell as low as one dollar and twenty-five cents and two dollars per hundred pounds, and extra, well-fattened, tender steers, vary from four dollars and fifty cents to five dollars. When these separate beeves are placed upon the market, the prices at retail should be proportionately different. Too often they are just about the same, the price for the extra steers often governing the retail prices for both.

"At present there is a great impetus among farmers and stock raisers to produce extra fine beeves for market, and it is only their just due that higher prices should be paid for them. It is no attraction

for them to spend their time and labor upon the animals if they are to come in competition with poor native scrubs from Texas. During the last ten years we find a great improvement in the quality of most beeves sent to market, and it seems about time for the farmers and breeders to combine to offset the pernicious system followed by many retail dealers. The consumers lay all the blame to the raisers, but in reality their butchers are at fault. They are imposing upon their customers by selling them two dollar beeves for five dollar ones. They may not serve one customer continuously in this way, but give enough good meat along with the tough kind so as to create the impression that it is a lottery with them. They buy the meat, and if it is tough there is no remedy for it, and if it is sweet and tender so much the better for the purchaser. The animal is lucky, thus speedily rectifying this, and the day is not distant when there will be little or no sale of inferior or lean stock at all."

The writer of this section of the story of the cattle industry, was much struck while making investigations as to the introduction of high grade stock into Texas, with the decadence of the horn during the last quarter of the nineteenth century. Horns on cattle are now regarded as a nuisance, and their removal is greatly to be desired. Nature has a wonderful way of adjusting matters, and furnished the original Texas steer with long horns in order that it could fight against its natural enemies on the ranch, and even protect itself from aggressive members of its own kind. To be more accurate, it was probable that the long horn was the survival of the fittest, being indeed the one breed of cattle which could withstand the countless difficulties to be met with in pioneer days. But at the present time the horn as a weapon of offense is exceedingly objectionable, as many a sadder and sorer tenderfoot has learned, and as a weapon of defense it is absolutely unnecessary. Cattle frequently injure each other unintentionally with their horns, and, moreover, a great deal of space is wasted by these excrescences. Now that stall feeding is gaining ground in Texas, the value of space is being felt materially. It is estimated that there are nearly half a million cattle now being fattened in the Southwest on cotton-seed meal, and it is possible that the number is much larger than the one given. Hornless steers can be housed with much greater economy, and it is also found that two or three more beasts can be placed in a car with less difficulty or danger when hornless than with horns.

Dehorning at one time looked as though it was going to become quite general in Texas, but the practice is less popular than was expected. It has been found that horns can be removed with comparative ease, and various patents have been introduced from time to time for facilitating the process. It has often been argued that, when the operation has been performed on calves, the horns can be removed without involving much suffering to the animal. There is, however, a great deal to be said against as well as in favor of sawing off the horns. Statistics go to show that, with cows, dehorning causes a temporary shrinkage of milk, but that this effect is only temporary. There is a percentage of loss from the operation which is open to the objection that it has to be repeated generation after generation. The Texas cattleman has often been written up as cruel and heedless in regard to inflicting pain on his stock. It is significant, in view of these criticisms, that for every man that gets rid of the horns on his steers by means of saw and other tools, at least five or six expend hundreds if not thousands of dollars in introducing the blood of hornless varieties, and thus gradually removing the objectionable articles by a more costly but much more merciful, and, of course, permanent process.

A well-known cattle commission man says on this branch of the subject: "With the introduction of black muley cattle from Europe into this country, it has become quite a custom among feeders to dehorn their cattle, or when purchasing the same for feeding purposes in the markets, nearly all well-informed feeders will require their cattle dehorned, and will pay from one to two dollars and a half per head more for a nice lot of muley or dehorned beeves than they will pay for cattle with their horns on."

This condition of affairs has become well known to feeders, and has caused farmers to undertake to dehorn all their cattle, and this, like everything else attempted by inexperienced men, is very badly botched in the majority of instances. It is a very small matter to dehorn a calf or a yearling and to do a nice job by simply removing the small young horn from the head with a sharp knife, which can easily be done and without much difficulty. But the practice of dehorning aged cattle, cutting the horns from a distance only from a half to an inch from the head, is folly of the worst kind. It is not only barbarous and extremely painful to the animal, but it leaves an ill-shaped head and looks like a botched job from beginning to end.

With the present modes of dehorning cattle, there is no reason why even three and four-year-old animals cannot be dehorned without positive injury, by clipping the horns off right at the edge of the hair, and separating them from the bone of the head right down at the roots of the horn. Cattle may be run into a chute, their heads fastened in a socket, and their horns clipped off with a dehorning machine without any difficulty, or without much serious inconvenience to the animal, and they will go right along gaining in flesh, and will not lose a feed from this mode of operations. The way cattle are dehorned sometimes, more especially in the Southwest, where there is a stub of horn left an inch long on the head, is cruel and barbarous, and requires a month or six weeks for him to regain his appetite and get on feed, so that he will commence thriving again. There may be, and probably is, a necessity for cattle to maintain their horns when grazing on the Western prairies and ranges, where they are attacked often by wolves, and where a cow may have to fight for her calf. In such instances it is absolutely necessary for the animal to have horns, and there may be some excuse for branding, as there is done on the Northwestern ranges, with a larger brand and more plainly, and for letting them retain their horns, than there is through other sections of our country.

Thus, one way or another, the horn of the Texas steer has received imperative orders to stand not upon the order of its going, but to go at once. To say that the average length of horn has been cut in two during the last ten or fifteen years, is to understate rather than overstate the case. Four feet was at one time a possible, if not common, length from tip to tip. To-day there are thousands of Texas steers concerning whom it may be said that the horn has been actually eliminated, so as leave not a stump behind, while of tens of thousands more it can be said that all the objectionable and dangerous features have been removed. Where three feet was once not considered excessive, eighteen inches is now considered out of the way, and the tendency is still to shorten. On the few enormous ranches that remain as such, and which resist the barb-wire fence longer than others, little improvement has been effected it is true. But these will fall in line in good time, and before the century is out long-horned Texas steers of the original type will be almost as rare as the buffalo, which used to dispute its right to pasture and range, and which was only exterminated a short generation ahead of it.

MISS ELLA PAXTON, known as the "Cowgirl of the Pan Handle," recently favored an enlightened Western audience with the following original production, which, in her introductory remarks, she styled "paradox" on "Beautiful Snow." She also stated that it was "paradoxed" while sitting on her horse one day, herding on her father's ranch, in the Pan Handle, situated about three miles from Mobeetie, Texas:

Oh, the steer, the beautiful steer,
Kicking the fleas from the point of his ear,
Flapping its tail in its frolicksome glee,
Hopping about like a Snake River flea,
Bellowing!
Roaring!
Thundering along!
Filling the air with its steerical song,
Till the rumble from its lung-laden pits
Scares timid jack rabbits and wolves into fits.
To me there is nothing on earth half so dear,
As the long-horned, slim-bodied Texican steer.

How often I wish that I was a steer,
With a long, shiny horn at the butt of each ear;
With a clear, fearless eye, and a tapering tail
That would flap like a whip in the maddening gale.
How I'd beller!
And roar!
And paw up the ground!
And lope over the hills with thundering sound,
And snort like a terror, and hump up my back
When I saw the wild cowboy pursuing my track—
And I'd laugh at his oaths as he fell to the rear;
Oh, I'd be a Jo-dandy, if I was a steer.

I once roped a beautiful steer—but I fell—
Fell from my pony with ear-piercing yell!
Fell, with the lariat fast to my wrist;
Fell, to be dragged through the grass wet with mist,
Bumping!
Rolling!
Grunting, I went!
A full mile a minute, or I don't want a cent.
The gravel and grass yanked the hide from my nose;
And ruined a pair of forty cent hose;
Aye, even my bustle was thrown out of gear
By the frolicksome freaks of that beautiful steer.

CHAPTER XIII.

The Texas Cattle Raisers' Association and the Work it Has Accomplished.

EVERY one has heard of the old-world philosopher who spent several years of his life in a fruitless search for an absolutely contented man. The story has been told in a variety of forms, but the main feature of it is the fact that after hunting up every alleged contented man of whom he could hear, the philosopher was finally recommended to an aged shepherd who had tended his flocks on the hills for nearly half a century, and who had frequently stated he had never, from infancy, had a wish unfulfilled. The old man was found apparently as contented as rumor alleged, and the philosopher approached him with a confidence born of despair. Seating himself beside the shepherd, the enthusiast entered into conversation with him, and, leading gradually up to the subject, finally asked him if he was absolutely content. Raising his staff and pointing in the direction of the flock of sheep grazing in the valley beneath them, the old man replied that he would be perfectly happy were it not for yonder black sheep, which insisted on straying into his flock, no matter what precautions he took to prevent it.

The truth of this story is doubtful, but its moral is obvious. Localized, it might read that many a Texas cattleman would be approximately, if not absolutely, content, were it not for the cattle stealer, and the man who, while too proud to actually steal, is mean and dishonest enough to take advantage of accidents, and appropriate any cattle which, like the black sheep in the story, persisted in straying on to his ranch.

We have already spoken at some length of that extraordinary art or science known as "maverick-ing" or "rustling." The barb-wire fence, the abolition of free range and the general settling of Texas and the Southwest, have increased the difficulties of the professional rustler. The same influences have also taken away the excuses, often made in years gone by, that cattle were accidentally appropriated, and that it was difficult, as well as expensive, to always distinguish accurately between *meum* and *teum* on the ranch. To-day the retention of cattle belonging to other people is known by its right name, and the retainer is branded as a thief, if not with a hot iron, at least with public opprobrium and disgust.

But there is another agency which has accomplished an inestimable amount of good, if not exactly in teaching certain cattlemen to be honest, in at least increasing the difficulties of dishonesty and respectable theft, if the term may be admitted, even in sarcasm. Reference is made to the Cattle Raisers' Association of Texas, which, during the last seventeen or eighteen years, has worked nobly, and in a most disinterested manner, for the good, not only of its own members, but also of the cattle trade of Texas generally. No review of the live stock interest of Texas and the Southwest, its past history and its present greatness, could be reasonably complete without a review of the work of this organization; hence we have no excuse to offer for recording its transactions at some length. If any other excuse for this chapter of history were necessary, which it certainly is not, the interesting reflex of changed conditions, as shown by the minutes and work of the association, would provide it. When it first commenced operations, free range was general, and its work largely consisted of appointing committees to manage the great annual round-ups, and return to owners or proper ranches all stray or wandering cattle. Gradually this branch of its work came to be, in a measure, superfluous and unnecessary, and to-day the important functions of the association are conducted by means of inspectors, who are stationed at shipping and other points for the purpose of locating stray or stolen cattle, and either returning same to their owners, or selling them and forwarding the proceeds to the treasurer of the association.

It was at Graham, in Young County, Texas, in 1877, that the association now known as the Cattle Raisers' Association of Texas was first conceived. In that town a stock raisers' convention was held on February 15th and 16th of the year named. A large number of prominent cattle raisers had issued a call for a convention for the purpose of discussing common wrongs and grievances, and to either

exterminate the cattle thief, or make his occupation too hazardous and costly to be remunerative. Mr. J. N. Simpson, of Parker County, nominated Mr. C. L. Carter, of Palo Pinto County, Chairman of the Convention, and Mr. J. C. Loving was made Secretary. An interesting discussion with a most instructive interchange of views followed, and it is to be regretted that a shorthand report was not made and preserved of the speeches, as they would be most interesting contributions to Texas history.

The result of the first day's deliberations was the determination to form a permanent organization, and the appointment of a committee to draft resolutions setting forth the aims and objects in view. This committee was composed of Joseph Graham, Sam Glascon, Rowland Johnson, A. B. Medlan, C. B. Brummett, J. T. Webb, George Wright, J. H. Simpson, J. C. Loving, H. G. Bedford, Tom Merrill, John D. Smith, W. B. Slaughter, R. E. Mabry, D. B. Gardner, J. C. Lindsey and C. L. Carter.

These gentlemen met on the evening of February 15th, and, working until late into the night, drafted a series of resolutions which resulted in the formation of what was then known as the Cattle Raisers' Association of Northwestern Texas, a name which was retained until the year 1893, when the more comprehensive title by which it is now known was adopted. The committee's resolution read that the association be named the Stock Raisers' Association of Northwest Texas, and that its officers should consist of a president, vice-president, secretary and assistant secretary, each to hold office for one year. The object of the association was tersely stated in the following words:

"That the members of the association shall work together for the good and common interest of the stock raisers of Northwest Texas, and do all in their power to advance stock interests."

In order to carry on the work, it was recommended that the territory included in the title of the organization be divided into a series of districts, and that members be allotted to each district, whose duty it should be to gather all stray cattle in their districts and notify owners of the same, holding them until the owners claimed them. Although changes in habits and customs and various other details have taken place, the lines of demarkation of these districts are interesting as a matter of history, and we record briefly the boundaries mentioned, giving credit to the men who commenced the work which has since been carried on so successfully, many of whom have since joined the great majority and attended the great final round-up. The first district was defined as commencing at the mouth of Keechie Creek, at its junction with the Brazos River, and running on a line to Cement Mountain; thence south to the Brazos River near the old agency, and down the Brazos River to the point of commencement. Messrs. C. L. Carter, Slaughter Bros., Thomas Scarborough, T. J. Atkinson, Charles Dalton and D. C. Kyle were assigned to the task of looking after this district, gathering in all stray or appropriated cattle and notifying the owners of the same. Messrs. G. G. Milliken, Wilson Bros., B. R. Willett, J. C. Loving, H. G. Bedford and W. C. Hunt were appointed committee in charge of the second district, which commenced at the north corner of No. 1 and ran to the mouth of Lodge Creek in West Fork to its head; thence south to where the telegraph crosses Dry Creek, and east to the point of commencement. It is only necessary to give the line of boundary in the words used eighteen years ago to remind the reader of what vast changes have taken place, not only in the cattle interest, but also in the State of Texas during that period. The idea of describing a point as where "the telegraph crosses" a certain creek strikes the reader in 1895 very strangely, and will take back hundreds of readers in memory to the old days, when it took almost as long to describe a point as to get to it.

The third district commenced at the head of West Fork and ran in a westerly direction to J. Farrar's camp on Slippery Creek; thence up the Little Wichita and down the divide between Deep and Turkey Creeks to the Brazos River, and thence on a direct line to Fort Griffin. This district being exceptionally large and important, was placed in the hands of a very large committee, consisting of the following well-known men: Messrs. J. H. Graham, J. T. Farrar, J. W. Medlan, J. S. and D. W. Godwin, J. D. Smith, E. C. Davis, George Terrell, A. B. Medlan, N. H. Graham, McCommis & Hunt, C. C. Mills, W. B. Mills, John Stevens, T. H. Brummett, R. E. Mabry, Hardisty, Boar & Co., L. L. Clark, Carpenter & Eaton, John W. Proffitt, R. J. Johnson and Wright & Bros.

The fourth district was equally extensive and important. Its boundary commenced at the head of Lodge Creek, running north to Red River Station, up Red River to the mouth of Pease River, south to the head of Beaver Creek; thence on the point of junction between the Buffalo road and the North Fork of

the Wichita and east to Millett's hay camp. Messrs. Waggoner & Son, Harrold Bros., Ikard Bros., Halsell Bros., Curtis Bros., Millett Bros., Stephen & Worsham, Reede & Day, Flippins & Merchant, S. B. Burnett, J. J. Lang, Lute Renshaw, John Dawson, Strong, W. S. Brown, F. M. Goodwin, S. A. Belcher, A. W. Crawford, B. B. Scarborough and Joe Bryant were assigned to this district.

The fifth district was not quite so extensive, and Messrs. W. E. Stewart, Roberts Bros., A. J. and F. M. Long, J. W. Frury, Clayton & Cowen, E. Martin, John Hullum, Carter & Grounds and Couts & Simpson were given the duty of attending to the rest of it. The district comprised all of Jones County and "that portion of Baylor that lies north of the divide between Clear Fork and the Colorado River."

Stephens County comprised the sixth district, to which were assigned Messrs. J. F. Webb, John Hittson, John Millsap, George Gambell, W. S. Dyer, C. L. Wasson, Willis Benson and William Hullum.

These resolutions were adopted at the second day of the Convention at Graham, after which the body adjourned to meet again at Graham on April 10th of the same year for the purpose of completing the scheme, forming a permanent organization and proceeding with active business. At the second

ANOTHER TYPE OF EXCELLENCE.

meeting a very important resolution was adopted. This was, that before any person should drive a herd from his ranch, he be requested to give notice to three of the stockmen who should examine the herd, and if they found any animal belonging to any member of the association or any stock raiser, to be authorized to cut it out and hold it, giving the owner the earliest possible notice. General instructions were also given to watch all trails and ranches, and promptly report any cattle stealing or straying. Arrangements were also made for the publication of full reports of old brands and marks, and the distribution of pamphlets and documents containing these records among cattlemen generally.

The work of permanent organization was completed, Mr. C. L. Carter was made President; Mr. J. D. Smith, Vice-President, and Mr. J. C. Loving, of Jack County, Secretary, with Mr. L. J. Connor, as Assistant Secretary. The President proved himself to be the right man in the right place, and a better selection could hardly have been made. As the records of the association show, "he was a pioneer cattle and frontiersman, having settled in Palo Pinto County in 1855, on the place where he died. He experienced many trials and troubles with hostile Indians, in addition to the heavy loss of property at the hands of these savages; he lost his oldest son, a bright and promising young man, just as he was growing into manhood, while on a cow hunt on his range." It was the good fortune of most of the older members of the association to have known Col. Carter for many years prior to his death. They all are

of the opinion "that no better man ever lived or died; that he possessed many, if not all, of the qualities necessary to make a good man."

He was re-elected year after year, and with the exception of one year, served the association honorably and faithfully until July 1888, when his career of usefulness was brought to a termination, and he went to his account deeply mourned by thousands of men who had learned to appreciate his sterling worth and his noble character.

Mr. J. C. Loving, who was elected Secretary, has held the office continuously, having been re-elected year after year. In 1879 he was elected Treasurer as well as Secretary, and has filled both positions for the last six years. For eight years he has been manager of the protective and detective department of the association. Mr. Loving's work needs no praise. It is conceded by the members of the association that much of its success is due to his patient hard work and exceptional executive ability. He has nursed the association from infancy to maturity, and is perhaps the best posted man on brands, marks and cattle generally, to be found within five hundred miles of Fort Worth, where he makes his headquarters.

Resuming our brief history of the Cattle Raisers' Association of Northwest Texas, as it came to be called after its formal incorporation, it may be mentioned that another meeting was held in August, in 1877, which was adjourned to March 15th, 1878, when Graham was once more the place of meeting. The Chairman reported excellent results of the year's work, and he was re-elected by the association, in spite of his request that some younger man might relieve him. Mr. J. B. Matthews, of Shackleford County, was elected First Vice-President, and Mr. J. R. Stephens, of Clay County, Second Vice-President; Mr. George Wright, of Young County, became Assistant Secretary, and to Mr. J. A. McLaran, of Palo Pinto County, was entrusted the care of the funds of the association.

From the minutes of the meeting, it would appear as though the most important business transacted was the revision of the round-up districts, and also the appointment of superintendents. Four additional districts were added. Number seven included all the country west of Sandy Creek and south of the Griffin and Breckenridge road; up that road to Fort Griffin; thence to the head of Foyle Creek, south to Hazel Wood and Carter's ranch; thence to Belle Plain; thence east to the head of Sandy Creek, with the round-up at Lynch's.

District eight joined numbers five and seven on the west. Its north line included the Matthews and Reed ranch; thence south to Sweetwater Creek, and along that creek to Kyle and Buntings', south to Mountain Pass, and east to Belle Plain, with the round-up at Matthews'.

The ninth district included all of Jack County not embraced in the preceding districts, and that portion of Palo Pinto County, north of the Brazos, not included in district number one.

At about this time Eastern papers were amusing themselves with exceptionally exaggerated statements about the bad men of Texas, about the blood-thirsty cowboys, and about the unruly scenes which took place at the round-ups. The members of the association, while knowing that the majority of these descriptions were overdrawn and regardless of fact, yet realized that there were occasionally grounds for criticism, and accordingly they passed the following resolution, copies of which were extensively circulated;

"WHEREAS, There has heretofore existed much confusion at the different round-ups, brought about by disagreements between outfits sent there.

"*Resolved*, That each owner of cattle send an outfit to a round-up placed in charge of a stockman fully competent to guard the men and to avoid disturbances, and that each outfit carry with it ample provisions in the way of cooking utensils and bedding, or funds with which to purchase the same."

Thus in the early days of the association was influence brought to bear in the direction of law and order. It reads a little out of joint to-day to advise or instruct ranchmen to send cooking utensils and bedding to any place, and the wording of the resolution again indicates somewhat the great difference between conditions as they existed in the seventies and as they are found in the nineties.

In August of 1878 the association met at Fort Griffin, the special business transacted being the fixing of dates for round-ups, and the issuing of general instructions.

On March 10th, 1879, the association was called to order by Chairman Carter, at Henrietta, in Clay County. An immense number of new members were admitted, and the association would appear

to have been established on a much stronger footing than formerly. A great variety of questions were brought before it for discussion. There was debate concerning prairie fires, and on the great losses resulting from the continual burning of grass. Resolutions were adopted calling for the exercising of the greatest possible care, and also for legislation providing for the punishment of any person wilfully or negligently setting fire to grass.

From prairie fires to horse thieves the distance was not great, and the Convention found itself exchanging condolences on the loss of good horses and valuable ranges. A committee was appointed to arrange for the special protection of members against horse thieves. This committee reported recommendations to make each member of the association place its range or horse brand on every horse, and record the brand with the Secretary. It also recommended the offering of a reward of two hundred dollars for the conviction of a horse thief. The recommendations were adopted, and very satisfactory results followed. In this, as in other matters, the association acted promptly, and hence the success obtained.

That the maverick was not entirely a thing of the past in 1879, is proved by the fact that this Convention passed special resolutions concerning the illegal marking and branding of cattle with the intention of depriving the rightful owner of the same. It was decided to offer a reward of fifty dollars for information leading to the conviction of any person guilty of this offense.

Another resolution condemned, in strong language, the practice of driving cattle on established ranges to the injury of owners. In this latter connection it was resolved that if any person opened a farm within the range of any member of the association he be required to erect and maintain a fence around the same. Failing to do this, it was laid down that he must bear the responsibility individually for any loss or damage accruing to him, and that owners of the cattle creating the damage could not be held liable.

The very lengthy and important session came to a termination by the adoption of a memorial to the State Legislature, begging for more stringent laws on the subject of burning prairie grass and hay. An amendment to the law of 1856 was asked, with the infliction of more severe penalties.

The Convention of 1880 was held in March, at Jacksboro. The officers were re-elected with slight exceptions, Mr. C. C. Slaughter becoming Second Vice-President, and Mr. Ikard Assistant Secretary. Communications of importance were read and the large number of round-up instructions issued.

Fort Griffin was the town selected for the Convention in 1881. All the officers were re-elected and a very large batch of members were admitted. A committee was appointed to consider the advisability of incorporating the association under the laws of the State. It was decided to pay a reward of four hundred dollars for the conviction of horse stealers, and a special assessment was ordered to cover the expenses incurred by hunting out the thieves.

A protest was made against the passage of any law for the leasing of the public school grounds of the State, and steps were taken to secure the proper handling of the protest by members of the Legislature. It was further resolved that a large number of cattle belonging to the association being further South than usual, the round-ups should be postponed to a later date than was usually the case. Arrangements were made accordingly and the Convention adjourned.

On March 20, 1882, the association met at Gainesville, and remained in session for three days. The business transacted was exceptionally important and lengthy in character, and the debates were very earnest and at times vigorous. The officers for the preceding year were re-elected by acclamation, and long lists of prominent stockmen were handed in by the membership committee. This was a busy year for the stockmen, and it was decided to increase the number of districts by subdividing some of the original ones. An immense amount of work was reported as having been transacted at the round-ups, and much satisfaction was expressed at the results.

Resolutions were passed making it imperative that a competent boss should attend the round-up and prevent unnecessary roughness, and especially the firing of pistols and general cussedness while cutting out cattle. It was also resolved that each boss must be given absolute power to discharge any man infringing orders as to this matter.

The lease law introduced into the Seventeenth Legislature was discussed, and was very roundly denounced by several orators in the ranks of the members. Resolutions were passed to the effect that

no more legislation was wanted by the cattlemen of Northwest Texas, and that any further changes in the stock laws would be regarded as strictly inimical to their interests. It was further resolved that the sale of the lands of the State in large bodies or tracts to any individual or firm, and especially to alien investors was contrary to the spirit of American free institutions, and was further calculated to establish huge monopolies to the detriment of the best interest of the State of Texas. A committee was appointed to attend the special session of the Legislature at Austin, to impress these views on the members and to protect the interest of stockmen generally.

A large number of claims for rewards for the detection of horse and cattle thieves were considered and allowed, and an assessment per head of cattle owned by the members was determined upon in order that the reward fund should be maintained. The rewards in some instances were largely increased, and a memorial to the sheriffs of the State was adopted, urging those officials to co-operate with the agents of the association in suppressing thefts on the plains and ranches of the State.

A resolution introduced by Mr. Harrold was carried. It dealt with several very important legislative points, and recorded the fact that the association looked with disfavor upon attempted legislation, having for its object in the remotest degree the dictation to any person, whatsoever his avocation might be, in any portion of Texas, and most emphatically protesting against the idea of creating any line of demarkation, imaginary or otherwise, looking to the separation or division geographically of the stock interest of the State. The association further recorded its protest against such legislation, denounced it as uncalled for, unnecessary and unjust, of a character that could not be enforced, and hence calculated to create contempt for the law and its authority.

In the following year, 1883, the association met at Fort Worth, being called to order on March 6th. A committee was appointed to amend the by-laws and to effect such reorganization as was necessary to check the stealing and illegal handling of cattle. Very few changes were made however, and the greater portion of the meeting was devoted to the adopting of additional measures to prevent stealing, and the listening to a most important paper read by Hon. Norman J. Colman, of St. Louis, on the necessity for increasing beef production. Mr. Colman gave a number of statistics on this point, and his speech was listened to with great interest, interrupted by very enthusiastic applauses.

On November 12, 1883, a called meeting was held at Gainesville for the purpose of considering what steps should be taken in view of the changed cattle conditions brought about by the fencing in of large pastures. At this meeting the changed condition of affairs was first thoroughly recognized, and a landmark may be said to have been established in the history of the cattlemen of Texas. It was pointed out that the fencing in of pastures in all parts of the State, and more especially in the Northwestern counties, made a change in the free range system inevitable, and that these changes must be accepted with good grace, and without murmuring. A large number of suggestions and speeches were made, and finally the following resolutions were adopted:

"*Resolved*, That it is the sense of this meeting that a law ought to be passed by the Legislature that will protect all property rights, either in fences, grasses or houses, with a penalty attached to protect such property rights from wanton and malicious destruction.

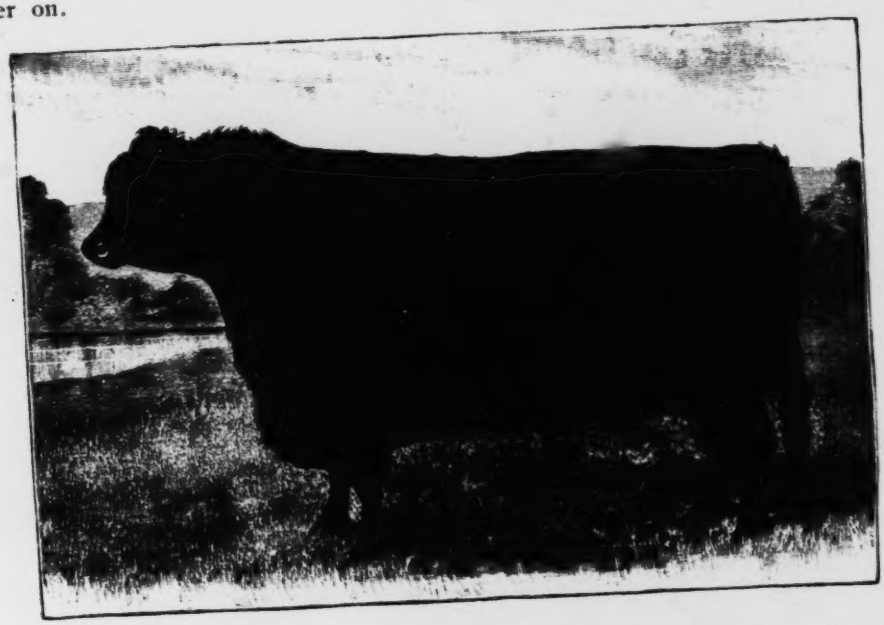
"That all property taxed by the Government is entitled to the same protection, no matter to whom belonging, and whether the property be used for agricultural or grazing purposes.

"That it is the desire of this Convention that the people be provided with all necessary public highways or thoroughfares for first, second or third-class roads, and that each member of the association be required to establish gates at all places and points where the neighborhood roads pass through his pasture; and that any member of this association refusing to comply with this resolution be subject to suspension."

The adoption of these resolutions, eleven years ago, is perhaps the most conclusive answer that can be given to charges that have been made from time to time as to the aggressive and overbearing attitude of cattle feeders and raisers, and their stubborn determination to stand in the way of the inevitable and the impossible. Again and again the public have been told of the monopolies established by so-called cattle barons, of small farmers and ranch owners being crowded out of existence, and of the way in which the rights of the poor have been invaded by the strong arm of the rich. History shows us that in many respects it is the cattlemen who have been encroached upon year after year, and that at

least the better element in the trade have invariably opposed monopoly and labored for the common good of the State as well as for the interest of cattle people. If this history serves no other purpose than to make these facts obvious, it will receive ample justification and accomplish a great and good work.

During the winter of 1883, there was a distinct boom in the cattle stealing business, and when the members of the association met to hold their eighth annual meeting at Dallas, on March 11th, 1884, there was blood in the eyes of a good many of them. The officers were re-elected, and Messrs. F. R. Sherwood and L. P. Cunningham were appointed Assistant Secretaries. After precautions had been taken in regard to keeping diseased cattle out of the State, the cattle-stealing question came up again. Not only was it decided to increase the reward for the conviction of cattle stealers to one thousand dollars, but a distinct departure was made in the policy of the association, by the appointing of detectives and inspectors, and assigning them to various duties, chiefly of a protective character. At this time the general round-up had been abolished, owing to the gradual fencing up of the country, and the necessity for this change in the mode of conducting the association's operations became obvious. That the change has been a very successful and prosperous one, we shall see later on.



A resolution was passed favoring a National Convention of cattlemen, and a committee was appointed to report as to trails for cattle from the Indian Territory. Mr. E. R. Stiff, of Collin County, talked at length on the value of Shorthorns, and the importance of introducing their blood into native herds. A large number of members endorsed the necessity of improving the breed of cattle kept, and it may be said that the general improvement in Texas cattle, as distinguished from prior individual, but unaccountable, effort, dated from this Convention.

A petition to the Legislature was adopted, calling for a law appointing a Sanitary Commissioner and a State Veterinarian, to investigate all statements and charges as to the so-called splenic fever, which, by exaggeration, was injuring the Texas cattle business materially. It was also resolved that all laws as to quarantine, and the driving of cattle from one State into another, should be uniform, and should be impartially enforced by the general government of the United States, which should enact all laws necessary for either the promotion or prohibition of trade, and the handling of live stock between the different States and Territories.

The Concho and Colorado Association concurred in these resolutions, which were placed before the proper authorities, with more or less satisfactory results.

In 1885, Mr. Carter, who had repeatedly asked to resign the Presidency, insisted on his resignation being accepted, in order that he might secure rest from the very arduous duties connected with the office. His resignation was accepted with deep regret. Mr. J. R. Stevens was called to the chair pro tem., and Mr. J. N. Simpson took the floor, and, in a speech of deep feeling, eulogized the retiring President, calling attention to his invaluable services to Texas and the cattlemen, and moved that Mr. Carter be made a life member of the association. Mr. C. C. Slaughter seconded this motion, which was carried by a rising vote. Mr. Slaughter was then elected President, and Mr. Stevens, resigning the First Vice-Presidency, was also made a life member. Mr. J. M. Lindsay was appointed in his place, and Mr. J. F. Evans was made Second Vice-President. Three delegates were nominated to represent the association at the National Convention of Cattlemen to be held at St. Louis the following November.

The Executive Committee appointed at the last meeting reported the best possible results from the change in the policy of the association. A million head of cattle had been inspected; at the different markets 344 stolen or stray cattle had been recovered; 166 had been located and cut out at shipping points; 343 had been found on ranges and trails. The total number of cattle recovered and restored to owners was 853, and the valuation placed upon the steers was twenty thousand dollars.

The tenth annual meeting of the association was held at Weatherford, in March, 1886. At this meeting, Mr. Carter was persuaded to once more occupy the highest office within the gift of the members. Mr. W. S. Ikard became First Vice-President, and Mr. S. B. Burnett, Second Vice-President. Further pressure was determined upon for the proper inspection of cattle, and it was decided to co-operate with the International Range Association in every possible manner.

The eleventh meeting was held at Fort Worth in March, 1887. The Executive Committee presented a lengthy report, showing the result of the work done during the preceding year. From this it appeared that the following number of cattle stolen or strayed had been recovered and returned to members and owners during the year:

At markets	191
At shipping points	79
On trails	646
Recovered by range detectives	100
Total	1,016

The expenses of the Executive Committee for four years were reported as fifty-four thousand dollars, or twenty thousand dollars less than the value of the cattle cut out and returned to owners.

It was reported with much regret that the crime of cattle stealing of a certain character was on the increase, and that additional steps were necessary to check it. The detective service was strengthened, and it was determined to take additional precautions as to brands, and especially as to preventing duplicates.

The year 1888 was marked by the death of Mr. Carter, the original President. He was succeeded by Mr. A. P. Bush, Jr., of Colorado, Texas, the gentleman who is still presiding over the association. At the twelfth annual meeting at Gainesville, on March 13th of this year, a committee was appointed to combine with the Bureau of Animal Industry in gathering information and facilitating the removal of cattle from alleged infected districts. Resolutions were passed opposing the bill throwing Oklahoma open for settlement, and also the amended Palmer bill to place the control of Southern cattle in the hands of men whose interest it was to keep Texas cattle out of the market, "such a course being calculated to involve the loss of several millions of dollars to the cattle interest of Texas." A delegation was appointed to attend the Convention of the International Range Association at Denver, and a hearty co-operation with that body was promised.

The number of cattle reported as having been recovered by detectives of the association during the year was eight hundred and thirty-three, and it was determined to push this line of work to the utmost.

The practice of the Indian police charging a dollar a head for all stock straying across the Red River and returned to owners was condemned, and arrangements made to get rid of the tax. Resolutions in favor of opening necessary trails and for better made shipping cars were also adopted.

The thirteenth annual meeting of the association was held at Fort Worth, March 12, 1889. The number of cattle recovered during the year were reported as being worth ten thousand dollars. Resolutions were adopted endorsing the project of establishing stock yards at Fort Worth, and also slaughter works. Special attention was paid to the growing practice of horse and cattle thieves in Greer and other border counties, and driving stolen stock into the Indian Territory. A memorial was adopted in favor of uniform rates for shipping live stock to Chicago, St. Louis and Kansas City.

Fort Worth was again the place of meeting in 1890, and the value of cattle saved during the preceding year was reported at thirteen thousand dollars. A considerable increase in the practice of cattle thieving in certain quarters was again reported, and it was resolved that one or two inspectors be appointed by the President to inspect all shipments of live stock going East or North to market, and that the same be authorized to pay railroad agents to wire inspectors so that they could go to shipping points or places of destination to inspect the cattle in all shipments.

In 1891 the association held its fifteenth annual meeting at Dallas, and some necessary amendments in the by-laws were made. The amended by-laws contain much matter of special interest, and it is important that some of the most stringent of them should be recorded here as an index of the class of work done by the association. It is recorded in these official papers that whenever any cattle are cut by an inspector of the association, the shipper shall lose the freight, unless he satisfies the inspector at the time that he has an understanding with the owner; or unless the shipper has reported the animal to the inspector or commission firm selling the same.

Whenever there is any dispute between members of the association as to the ownership of any animal held by an inspector of the association, they may submit such dispute to the Executive Committee at a regular meeting of the same, upon the agreement of those in dispute to abide by the decision of said committee.

No member of the association shall have the right to claim any animal through the association, unless the same bears his brand, and the brand of the party from whom he claims to have purchased said animal shall not be considered his, unless he has written transfer of such brand. The preamble states that the cattle interest of Texas can be better guarded and promoted by a perfect understanding and thorough organization among the parties interested. The Executive Committee is called upon to hold regular meetings on the last Mondays in May, August and November, with called meetings whenever called by its chairman. This committee shall have the entire control of all of the business of the association excepting the time when in session. It shall have the power to appoint inspectors, agents and representatives, and an assistant secretary, if, in their discretion, such an officer be required; shall offer rewards and do any and all things which the association could do if in session, and its action shall be binding on the association. It shall audit all the accounts of the association, at each annual meeting make a report covering all matters requiring the attention of the association, and recommend such measures as it shall deem of importance for the action of the association. Any five members of the committee shall constitute a quorum.

Any person of the age of eighteen years or over, owning or controlling cattle, is eligible for membership, and one of the first duties of a member is to make and file with the Secretary a list of his brands and marks accompanying such brands, as nearly as possible, of all the cattle for which he asks protection; the number of said cattle for which he asks protection; the number of cattle to be not less than the number rendered by him for taxation, and to include all other cattle owned or controlled by him, with the number of his cattle, his post office address, location of ranch, etc., all of which shall be recorded by the Secretary in a book kept for that purpose, and shall be open at all times for the inspection of the members of this association.

Article twenty of the association enacts that, "Any member of this association who shall mark, brand, kill or sell, or in any way appropriate for his own use or benefit, any stock not his own, and without proper authority from the owner, shall be deemed guilty of an offense, and upon conviction, as hereinafter provided, shall be expelled from the association." Article twenty-one states that,

"Any person who shall drive other cattle than his own from their accustomed range, thereby damaging the owner, will be guilty of violating the good intentions of the association, and on conviction, as hereinafter provided, shall be subject to expulsion, suspension or reprehension, as the association or Executive Committee, by majority vote, may see proper to inflict."

It is made the duty of every member to report the violation of by-laws, and careful precautions are taken for the impartial trial of every member against whom charges should have been made. It is made the duty of the Executive Committee to consider said charges, and, if it deem a trial necessary, the said committee shall cause the Secretary to summon the accused to appear, with any witnesses or other evidence he may have, at the next meeting of the association, there to stand trial upon such charges. But if, upon consideration, the Executive Committee shall not deem a trial necessary, the accuser shall have a right to present his charges, together with such evidence as he may wish, before the association, at its next ensuing meeting, for its action upon the same; and, if it be deemed that a prosecution be necessary, the Secretary shall summon the accused for trial at the next ensuing meeting of the association, in the manner hereinbefore stated.

Whenever the Executive Committee shall be reliably informed by any member of the misconduct of any other member, and said information shall have been presented in writing, it shall be the duty of said Executive Committee to cause an investigation into the truth of such charges; and if, in the opinion of the committee, the facts warrant it, the committee shall cause the accused to be brought before the association for trial. The highest, or first degree of punishment, is expulsion; the second, suspension, and the third, reprehension; and a majority vote of the members present will be necessary to inflict punishment to any degree. After a member is expelled, he cannot apply for new membership within twelve months; and it is further enacted, that it is the duty of every member of the association knowing of a case of branding, killing, driving, milking, or in any way using or appropriating any cattle without proper authority from the owner, to report the same to the association, which binds and obligates itself to prosecute all such offenders to the full extent of the law.

These by-laws and rules have been acted upon with the best results, and may be taken as model articles for an association of this character.

Fort Worth was made the headquarters of the association, and an office provided for the Secretary there. The detective presented a most valuable report, showing the recovery of 265 appropriated cattle at Chicago, 274 at Kansas City, 106 at St. Louis, 91 on the Fort Worth & Denver Railroad, 78 in the Indian Territory, and 30 elsewhere. The total value of cattle thus recovered was $14,149. In addition to this, 577 head of cattle had been cut out of trail herds, and the aggregate value of cattle recovered was $21,073. The report was received with much approval, and the detective department was continued.

In March, 1892, the association convened at Fort Worth, Mr. Bush in the chair. In the course of his remarks, the chairman called attention to the fact that there were at that time eight million head of cattle on the Texas prairies, worth, at a low estimate, seventy-two million dollars. In prime condition, these cattle would realize, at the great cattle markets of the country, an enormous sum. He strongly urged the establishment of local packing houses and yards, and also the necessity of harbor and shipping facilities. The detective department made a lengthy report of its work, from which the following results appeared:

Recovered at Chicago	280	head.
Recovered at St. Louis	155	"
Recovered at Kansas City	386	"
In Oklahoma Territory	60	"
At Darlington, I. T.	63	"
At Washita	37	"
At Fort Sill	9	"
At Amarillo	29	"
At Colorado	5	"
On the Cherokee Strip	15	"

The total value of cattle recovered and returned to owners during the year was estimated at thirty thousand dollars, and a very general improvement in conditions reported.

A resolution was introduced and adopted whereby the prevailing system of docking broken-ribbed cattle five dollars per head by the purchaser, after they had been sold on the markets, was entirely done away with, and such cattle are now sold on their merits, being condemned before they are weighed, and sold separately as bruised cattle, etc.

In 1893 the association met again at Fort Worth, where it was heartily welcomed by the Mayor of the city. In his speech in reply, Mr. Bush said that although a few years ago the association had been on its decline, it was now at the zenith of its prosperity, with a record of a million and a quarter of cattle on its books, as well as the names of over four hundred prominent stockmen.

The Executive Committee reported at length, stating that during the preceding twelve months 2,540 head of stolen cattle had been recovered in the interests of members. Of these, 791 had been returned to their owners, and the remainder had been sold for $25,452, the proceeds being remitted to the owners.

The 791 head of cattle not sold would, at the same price the others sold for, be worth $11,509, which, added to the sales of the 1,749 head, would make the sum total of $37,963.50 as the value of the cattle caught by the inspectors for the past year. These cattle were caught by the following inspectors:

T. J. Moughon, at Chicago	193 head.
B. F. Denison, at St. Louis	705 "
Thos. W. Snow, at St. Louis	157 "
G. B. Grissum, on Fort Worth & Denver Railway	107 "
J. R. Kennedy, on Fort Worth & Denver Railway	137 "
W. H. Keen, on Fort Worth & Denver Railway	269 "
W. L. Lyons, on Southern Kansas Railway	165 "
V. W. Allen, on Texas & Pacific Railway	316 "
J. W. Holt, on Texas & Pacific Railway	6 "
Henry Hoover, on trail	35 "
W. G. Crump, in Indian Territory	91 "
B. P. Wade, in Indian Territory	61 "
William Smith, in Indian Territory	152 "
J. J. Stewart, in Indian Territory	47 "
Eugene Logan, in North Texas	59 "
Total	2,540 head.

At the second day's session the name of the association was changed to the Cattle Raisers' Association of Texas, and Fort Worth was finally made the permanent headquarters. The proposition of Mr. G. W. Simpson, of Boston, for the purchase of the Fort Worth Union Stock Yards was considered, and hearty co-operation was promised that gentleman in his proposed enterprise.

Before the meeting adjourned, its excellent work and great success was recognized by the receipt of the following applications for membership from prominent cattle owners.

Applications for membership were received from

	Head of Cattle.
J. W. Weaver, Indian Territory	600
Jules Washington, Indian Territory	2,000
Jones & Robinson, Indian Territory	400
A. J. West, Live Oak	700
Garrett & Collier, Hall County	
R. M. Bourland, Indian Territory	1,000
Live Oak Ranch Company	5,000
Hume Bros., of Austin	5,000
Jackson & Aldwell, of Sherwood, Coke County	2,500
Barnett & Gibbs, of Dallas	

	Head of Cattle.
W. T. Ward, of Knox County	500
L. H. Pruett, of Scurry	500
R. B. Masterson, of Mobeetie, Hemphill County	1,200
John R. Lewis, of Nolan County	1,000
M. T. & E. J. Johnson, of New Mexico, Indian Territory	5,000
John Dennis, of Eastland County	150
J. M. Campbell, Indian Territory	100
H. Windom, of Callahan County	400
G. H. Ray, of Texas	500
T. J. Ciegg, Eastland County	400
Jas. Funk, of Tom Green County	2,500
Wm. Powell, of Rome, Wise County	
H. P. Reed, of Lowell	300
Louis Runge, of Menard County	2,000
W. W. Watts, of Crosby County	3,000
J. V. Stokes, of Midland and Ector Counties	1,000
H. C. Field, of Menard County	500
C. R. Breedlove, Fisher County	100
Auson & Venner, of Tom Green County and Osage Nation, Indian Territory	3,000
J. B. Polk, of Hall County	500
L. C. Beverly, of Clarendon	200
Rowe Bros., of Clarendon	10,000
T. A. Thompson, of Runnells County	1,500
L. K. Purdham, of Kiowa and Comanche Reservation	1,000
T. J. Hunt, of Eastland County	500
W. A. Blackburn, of Castro County	800
Cresswell Ranch & Castle Company (Limited), Canadian	20,000
Jas. McLemont, Kinney County	7,000
J. G. Rice, of Sterling County	1,000

The immense area covered by these applications shows how thoroughly the association had outlived its original title.

Last year the eighteenth annual Convention of the association was held, and Fort Worth was again the meeting place, and a most interesting address was made by a gentleman who reviewed the history of the cattle raisers of Texas. "From the Red River to the Rio Grande, from the ocean to the plains," he said, "the live stock interest of Texas has been one of the foremost within the broad commonwealth. It has been reserved though, for the Western stockman, irrespective of State or section, not only to develop the Western plains, but to carry in his bosom the heart of a lion, the intrepidity of a soldier, yet with that enduring patience which has paved the way of civilization through all ages. It has been said that he who makes two blades of grass grow where one has grown before is a benefactor of the human race. Likewise should it be said that he who can produce a bullock that will fatten two pounds on the same feed required to fatten one before, should be called a benefactor of the human race. We say that the wisest statesmen of our time have given close attention to the development of our herds. Noted among these men was the great Clay, of Kentucky, who was one of the first importers of blooded stock from the old world, and for many years Kentucky was considered the home of the shorthorn that is now so prevalent in all the Western country. The time was when the Texas steer was looked upon as a measly, unprofitable animal, commanding no respect in the markets of the world. That day is passing rapidly away. New conditions have obtained. The improvement of your herds has gone on. The increased weight of your cattle shows the diligent attention that they have received. In this great State we find that the people are interested in new methods, having in view the successful feeding and marketing of their stock, and one of the most noteworthy instances with which I am acquainted occurred not more than two weeks ago, when Mr. Burnett, a member of the Executive Committee of this association, having sold to the Ardmore Oil Mill Company, of Ardmore, Indian Territory, some of the cattle that he had raised, they were bought by the king of exporters of the United States, the Eastman

Company, and shipped direct to New York, and they weighed over 1,400 pounds average at the Ardmore pen. And to-day, I am told, Mr. Burnett has brought to this city two car loads of cattle which merit your closest attention and inspection. They weighed over 1,500 pounds average on the scales at Fort Worth Union Stock Yards. These are notable instances, but they are not the only ones.

"Eight or ten years ago it was an almost unheard-of thing that any number of Texas steers should average in weight as much as 1,200 pounds on the market. Fifteen years ago 1,050 to 1100 pounds was about the highest that we could possibly expect from four or five months' feeding of our best cattle. So you see that from 1,050, in fifteen years, we have advanced to 1,500 and 1,600 pounds; that it has become a common occurrence for us to have cattle that will weigh as much as 1,300 to 1,400 pounds. This has not been accomplished by the extra amount of feed given to our stock, but it has been accomplished by the improvement of our herds. About the same amount of feed was given then that is given now. About a year ago, a bunch of the '6666' brand of cattle was sold to Mr. Moore, and fed at Denton, that averaged 1,046 pounds when they went into the feed lots, and weighed in the market at Chicago 1,349 pounds, after being on feed 110 days. These are facts that are worthy of your serious consideration. You must change your old methods of doing business. Instead of running thousands of cattle in the West upon lands that may be affected by the drought, where the grass may be destroyed at times and herds moved about, you have got to commence raising fewer cattle and better cattle, until your herds are reduced to that number where they can be successfully taken care of and well matured for market. I might say that there has been an innovation in the cattle business. This shipment of cattle direct to New York has had an encouraging effect among Texas stockmen. They feel that there is another door open for their cattle. In the shipment of cattle to the East in the past years our prime cattle, coming from the State of Texas, have been known as native cattle. Texas cattle have not received that degree of attention and recognition which they have merited, but gentlemen in the East who are butchering and exporting to European markets are beginning to learn that as good an animal can be produced in Texas as can be produced in any other country on the face of the earth."*

The expenditure of the association for the year was reported as heavy, but results were excellent. The Secretary reported the number of cattle taken or cut out by the inspectors at 3,509 head; of that number there was sold, 2,105 head, aggregating in cash amount, $34,278.94; the balance of the cattle, 1,404 head, at the same value, amounts to $22,857.32, making total value of cattle taken, $57,135.26. Besides this there were still held for investigation seventy-five head, valued at $1,221, making a total number of cattle actually cut by our inspectors, 3,584 head, valued at $58,357.26. These cattle were caught at an expense to the association of $35,488.04, which shows a saving to the members in money of $22,869.22.

Following is a list of inspectors, locations and the numbers of cattle cut by them:

B. F. Denison, Kansas City	720	Henry Hoover, Mangum, Tex.	40
Thos. W. Snow, National Stock Yards, Ill.	381	T. E. Baxter, Ponca, I. T.	35
V. W. Allen, Chicago and Colorado, Tex.	380	J. J. Stewart, Fort Sill, I. T.	25
W. L. Calahan, Midland	325	John Graham, South Omaha, Neb.	16
W. H. Keen, Wichita Falls, Tex.	329	C. E. Martin, Victoria, Tex.	15
W. L. Lyons, Canadian, Tex.	317	Perry Griffin, Tex.	12
G. W. Waddell, Chicago, Ill.	198	J. O. Taylor, Beeville, Tex.	7
J. R. Kennedy, Amarillo, Tex.	142	W. N. Huff, New Orleans, La.	7
S. H. McCabe, Elgin, Kan.	118	W. F. Smith, Ponca, I. T.	5
J. W. Smith, Colorado, Tex.	82	Geo. Montgomery, Union Stock Yards, St. Louis	3
Eugene Logan, on the range	78	D. G. Franks, Del Rio, Tex.	5
W. G. Twyman, Lamar, Colo.	66	P. S. Roberts, Higgins, Tex.	2
Eli Moore, Wichita, Kan.	58	T. J. Moughon, Chicago, Ill.	2
H. C. Babb, Rock Island Railroad	57	J. N. Hewett, San Angelo, Tex.	1
W. G. Crump, Darlington, O. T.	42	Total head	3,509

* The experimental purchase of Texas cattle for the East has not been repeated in the manner anticipated or hoped, the reason given by a gentleman well qualified to know being "that the purchase of cattle in the feed lots of Texas and their movement to the East was not attended with sufficient enthusiasm to justify the adoption of this method of securing supplies for either domestic or foreign consumption."

One thousand four hundred and four head of this number were turned over to owners, or returned to their range. The balance, 2,105 head, were sold for the benefit of owners, and brought an aggregate of $34,278.94.

To give an idea of the immense work done by the association during the preceding ten years, a report was presented of the number and value of cattle secured and returned to members during that period.

Some idea of how the extraordinary results have been attained, may be gleaned from the instructions issued to the inspectors. Each of these is required to make use of the brand book furnished him, and to "closely, honestly and impartially" inspect the marks and brands of cattle, whether being shipped to market or driven or shipped from one range country to another. All such cattle found in the possession of any person not having legal authority to hold or handle the same, must be taken possession of for the owner, as his agent.

When parties refuse to give up cattle, and have no authority to handle them, the inspector must proceed as the law directs, to get possession of the cattle, by sequestrating them in the name of the owner, as his agent. If necessary, in such cases, he is authorized to employ a lawyer to conduct the cases. When an inspector finds persons in possession of cattle under such circumstances and conditions that they are guilty of theft of such cattle, he must at once make a complaint against, or report such parties to the grand jury, always taking the quickest plan of bringing them to justice, and seeing that all necessary witnesses are properly summoned to appear and testify in such cases. After indictments are found, the General Manager of the association will take charge of the cases and have them prosecuted.

An inspector must not allow anyone not a member of the association to examine his brand book, or look at any mark or brand in the same, keeping it secure from cattle thieves, who often try to steal them. He must not tell anyone not a member of the association who the owner is of any particular mark or brand. In many instances thieves locate stray cattle, and if they can find out that the brands of such stray cattle are not on the association books, they have no fears about stealing them, and as the object, or at least one of the objects, of the association is to prevent stealing, the inspectors are warned not to furnish such thieves with the information as to whether they can steal these located strays with impunity or not.

The inspectors may not handle any cattle outside of those belonging to members under the penalty of being discharged for the first offense. When parties are guilty of stealing members' cattle or horses within the scope of his work, or under his knowledge or observation, the inspector is required to diligently look into and work up the matter, and do all and everything in his power honorably to bring such parties to justice for such violation of the law. All stock taken must be cared for to the best advantage. Inspectors at shipping points and on the range secure pasture for all cattle recovered by them at best possible rates, to be paid by the association; and in his report of such cattle, states what pasture he put them in and what the cost is per month per head. The Secretary reports to the owner where his cattle are, what pasture they are in, etc., and if within reach of the owner, and he so desires, he can send and get the cattle.

If the owner does not take his cattle from the pasture within a reasonable time, and they are fat and ready to market, the inspector may ship them to market by and with the consent of the manager, shipping to such commission house as the manager may direct. The proceeds of all cattle shipped in this way, with account of sales, must be sent to the Secretary, and a duplicate account of sales may be sent to the inspector shipping the cattle.

When an inspector at a shipping point ships any cattle to market he must make a tally of them, describing the marks and all the brands of each animal, and who he claims same for, and any other information that the inspector may think necessary, and forward the same to the inspector at the market to which he is sending the cattle, so that it may reach the inspector in the market before the cattle arrives. Also, when an inspector at shipping points wishes to have any cattle in a shipment passed by the inspector at the market, he must do as above directed in shipping cattle; also report to the Secretary all cattle so passed and why they were passed. Inspectors at the markets are governed by these instructions as to legal authority for handling cattle; also as to the manner of procedure where

shippers refuse to give up our cattle; also as to reporting to the Secretary all cattle the proceeds which they have caused to be held up.

Under the late regulation of the association, inspectors are required to collect the gross proceeds of cattle caught by them under certain circumstances, which are as follows: Parties who ship members' cattle without authority, and the circumstances surrounding the shipments indicate that they did so with a view of getting the proceeds for their own use and benefit, and to deprive the owner of the same, then in such cases they are required to collect the gross proceeds of all such cattle, except what is allowed the commission men for selling, but nothing more.

They must also weigh all cattle caught separately, so that they can get just what the cattle bring in the market. It is sometimes the case that shippers will ship one or more steers that don't belong to them with a lot of their small cattle, and, when found by the inspectors, give him an average of the lot. "We don't want any more of that kind of business," says the President, "so don't fail to weigh separately the cattle caught."

Inspectors must be men of good moral character, industrious, and capable of filling the position; must be practical cowmen, good and quick on marks and brands, and must be strictly temperate and sober. No habitual drinkers need apply for a position on the force. If any inspector drinks to excess while working for this association, it will subject him to being discharged from the service.

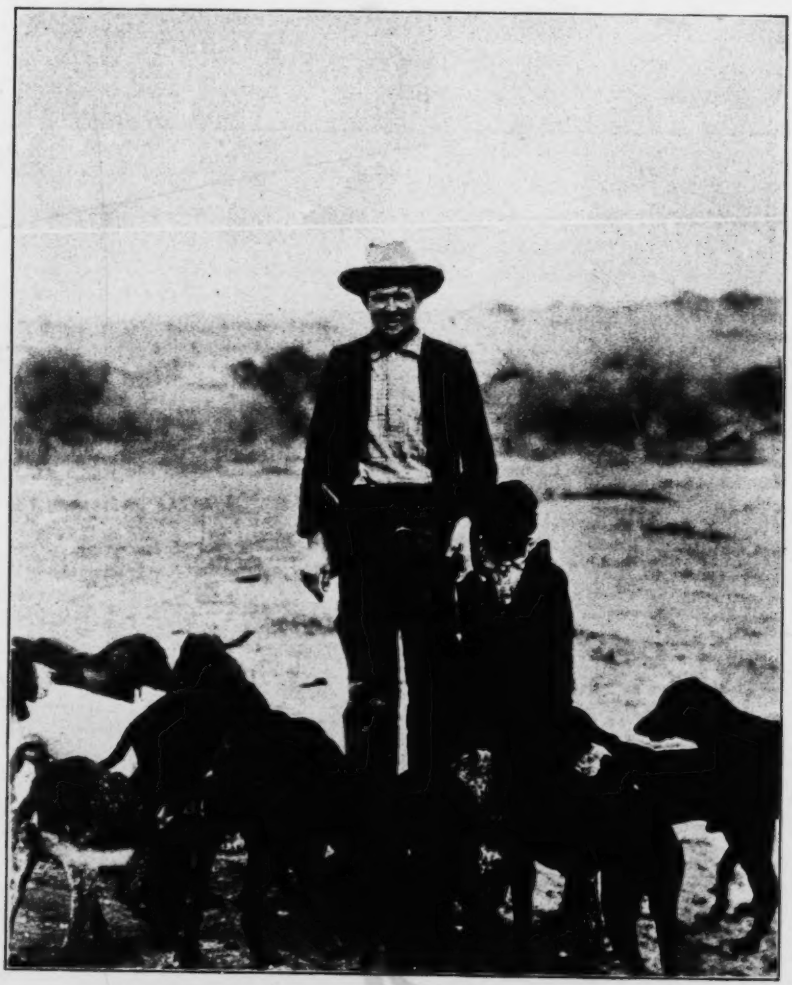
Inspectors are requested to give their entire time and attention to the work required of them, and at all times and under all circumstances to work and exert their best energies for the promotion and general good of the association and its individual members.

The increased resources of the association enabled it to maintain during the whole of the year 1893 permanent agents at Chicago, St. Louis, Omaha, Kansas City, New Orleans and Wichita, as well as to keep agents at all shipping points in Texas and the Indian Territory. These agents discovered that cattle were being driven from Texas and the Neutral Strip into Southern Kansas, and being shipped to the Northwest. One large shipment of cattle had been traced to Denver, the thieves having been convicted and the cattle returned to the owners. At the time local or railroad inspectors were placed in Southern Texas there was every indication that an extensive and well-organized system of cattle stealing was about to be inaugurated in that territory. As a proof of this, in one instance two or more car loads of stolen cattle were found abandoned close to a shipping point, where, the day before, an inspector had been placed. Upon investigation, some two or three hundred head of stolen cattle were caught. "This seems," says the report, "to have paralyzed all thieving in that part of the State for the time being, though we well know from past experience that it is only by constant watchfulness that we can keep this lawless element under control. Therefore, it should continue to be the policy of the association to catch and prosecute thieves, regardless of cost."

The dressed-beef question was discussed at great length. "The class of cattle, as a whole, produced in Texas and the Indian Territory, is more desirable for all markets than that of any other locality. The Eastern slaughterers are becoming familiar with the Texas bullock, and intend to adopt the same tactics as the packers in other great centers, which is to make their purchases nearer the source of supply, which not only affords them a better selection, but gives them an opportunity of making and saving by shipping direct. Texas produces one-seventh of all the cattle raised in this land, and this alone is sufficient reason for the establishment of a home market, and with the experience of the past, it is reasonable to suppose that the market nearest the source of supply would continue to develop and increase.

"There are now seven live stock markets in the West, including Chicago, Kansas City, St. Louis, Omaha, Sioux City, St. Joseph, and last, but not least, Fort Worth, which offers greater advantages to the Texas stock-grower than any other of the great markets. The Chicago packers have been of great advantage in distributing the Texas product, and through their influence have created a demand all over this broad land. They have been paid for all the service rendered, and the time has now come, in the progress of events, when the grower, who is the party most interested, should adopt such methods as will give him the greater return for his investment, and as all the waste, shrinkage, additional freight and yardage charges must be borne by the producer, it behooves him to figure as closely as possible to the minimum.

"The exporting of live cattle now seems to be a prominent industry, and with the proper steamship facilities, there seems to be no reason why the Texas animal should not be shipped direct to Liverpool from New Orleans and Galveston, and if the cattle feeders will arrange to have fat cattle ready for market at all seasons of the year, and feed them in such a manner that they will not be obliged to dispose of them within a limited time, the home market will be assured, and buyers from all parts of the country will be seeking their supplies from the Fort Worth stock yards. The attention of slaughterers throughout the country is turned toward this great center, and besides this, the railroad and steamship managers are now soliciting through business, which they never before enjoyed, and are willing to make concessions in order to secure it. Resolutions on this important subject were adopted."



A RANCH "PACK."

On the third day of the Convention, Col. Black called attention to a matter which the writer of these historical chapters has felt very often while preparing them. This is the need of a National Bureau of Statistics, and his remarks were heartily endorsed.

The 1895 Convention was held in March, at Fort Worth, and the attendance was very large. Mayor Paddock turned over the keys of the city to President Bush, and Mr. George Loving made a characteristic address, in the course of which he said:

"It would be difficult in any State, in any country, in any clime, to collect together a body of men whose personnel would compare even favorably with the Convention here assembled to-day, while for intelligence, cultivation, integrity, high manhood and loyal citizenship, it is doubtful if a superior body of men could be chosen and congregated from any class or industry in the land. I mean no fulsome praise in thus speaking, but plain, simple truths, known of all men who have mingled with the cattlemen of Texas as I have, and known them as I know them. It is not singular, therefore, that Fort Worth should open wide her gates, and bid you welcome to her hospitality, or that the local live stock men should feel a pardonable pride in having their brethren as guests on this occasion.

"In this association is closely linked the past, the present and the future of the cattle interest in Texas. I see before me many of the pioneers and early settlers, who, more than a third of a century ago, moved beyond the lines of civilization, and with daring intrepidity planted their banners far out in the wilderness. I see descendants of others who fell in the struggle with the savage, and I see the new comers from all States and Territories, and the new beginners from all parts of our magnificent State,

all united in the common brotherhood, engaged in a common industry, loyal to the common good, and pledged to stand by each other's interests, promote each other's welfare, and guard each other's rights. It is a grand association, potential for good to all classes and all interests, and splendidly equipped and supremely endowed for the mission of making Texas the leading live stock State on the earth.

"It has been my privilege from youth up (having been cradled on a frontier ranch), to be associated with the cattlemen, and a close observer of the live stock interests of Texas, and am therefore in position to know whereof I speak, when I say this association may justly be congratulated as embracing the best, the bravest, the most solid and the most progressive men engaged in the industry.

"It was a wise step you took two years ago, in so changing your constitution as to encompass in your organization the cattle raisers of the entire State, and you are to be congratulated on the results, as indicated by the large attendance at this meeting, and the character of the men who have come up from all parts of the State and the adjoining Territories to take part in your deliberations.

"You have many reasons for being satisfied with the achievements of your organization. You have brought system and safety out of chaos and confusion. You have improved the breeds of your herds, you have educated all classes concerned in stock raising, and mavericking is no longer a profitable vocation in Texas. You have recovered many thousands of dollars worth of stolen stock and in many instances punished the thieves, and your detective system is now so complete and so extensive, that it is nearly impossible for a depredator to get away with his plunder or escape punishment. You have been instrumental in securing valuable legislation for the protection of the live stock interests, and you have paid into the treasury of the State several hundred thousand dollars for the privilege of grazing your herds on the wasting grasses of the unpatented prairies. You have planted wealth, culture, the church and the school house throughout a vast empire of territory that but a little while ago was the home of the buffalo and dominated by the savage. You have placed the cattle industry of Texas in the foremost front and made it worth the while of the largest dealers on the continent to make your acquaintance, and the largest capitalists engaged in the business to establish packing houses at your door.

"By your conservatism, forbearance, manly magnanimity and high appreciation of justice, you have preserved kindly relations with the man with the hoe, and you are at this very hour the prime factor in harmonizing the three great controlling industries of the State, agriculture, live stock and railroads, and bringing them to a proper understanding of their mutual dependence and to foresee a period of prosperity unparalleled in the history of the nation in the unity of the policies, interests and rights of all, recognized in legislation, respected by the people and enforced by the courts. What promotes the interests of agriculture advances the prosperity of the railroads, and what benefits these two great industries can but conserve the stock-raising interest, and vice versa, the policy and the legislation that enhance the stock raisers' profits must redound to the benefit of other kindred industries.

"It is probable that the auspices under which you meet this year are brighter and more encouraging than at any previous meeting within your history. You have had a long period of losses, discouragement and despondency, but the night is passed and the bright sun of the morning bids the cattle industry of Texas be of good cheer and go forward with renewed energy, strengthened confidence and courageous venture. The heavy losses sustained during the protracted drouth of the past few years may not have been unmixed evil. Good sometimes comes of the direst disasters, and the traditional 'silver lining' may in this case, to the cattlemen of Texas, become veritable gold. The pastures were overstocked, grass was exhausted, cattle were not improving as rapidly as could be wished, and prices had fallen too low for profit. The mortality and the annual transfer of more than half a million head for several years to the grazing fields beyond the limits of the State, was to a great extent a providential cutting down of the herds, thus leaving room and sufficient grazing for those that were left and affording opportunity and incentive to improve the breeds.

"The grazing grounds of Texas were thus given a rest to some extent, while you have very wisely taken advantage of the opportunity to improve your herds; consequently they have brought a better price in the markets, and many shipments of Texas steers, under the improved methods of feeding and breeding, have been rated as 'tops' and command prices equal to the best Western product. You have

but to keep up this system of improvement and intelligent management to place Texas, at no distant day, first in the quality of her beef, as she is first in numbers. This, Mr. President, is not the only reason why I say that the cattle situation in Texas is most favorable, and that those who contemplate embarking in the business, or who wish to increase their herds, are not likely to find lower prices for investment for many years to come. Texas cattle are going to be in great demand in the future, and new markets are soon to be opened to her enterprising citizens. She is the gateway to the West India Isles, Mexico, Central and South American States, and the Asiatics through the Panama canal; and deep water at her ports being now assured, the commerce of the interior is already preparing to find shipment over Texas roads through Texas ports to foreign markets. Let no man doubt that at an early day we shall have deep water navigation at one or more Texas ports, and that capital, enterprise and shipping will come to control the heavy freights and all rapid transit commerce for all that vast region of country lying between the Mississippi and the Rocky Mountains. In this new era of prosperity, the cattle industry of Texas will be more interested and will reap greater profits than industries further from the point of water shipment, and she will take her position as the leading cattle-producing and meat-packing State of the continent. The trains of commerce that we now see rolling northward from our very coast, carrying the products of our soil and our ranches a thousand miles to market, and another thousand miles to deep water for shipment, will continue to roll with increased speed and enlarged tonnage, but in the opposite direction, bearing the grain of the West to deep bottoms in our gulf ports, and our fat steers of the Territory, Kansas, Nebraska, Iowa, Colorado, Wyoming and New Mexico to the stock yards and packing houses of the Southwest for shipment through Texas deep-water ports.

"It were well, therefore, that the Cattle Raisers' Association of Texas should prepare to accommodate the new order of things, and it were wise to take early action looking to increased packing facilities; for, though we have here at Fort Worth a magnificent plant with large capacity and ample capital, the time is near at hand when not only the entire Texas product, but the product of a wide extent of grazing country beyond her Northern and Western lines will seek packing facilities on the cheapest lines of transportation and in proximity to the waterways that float the largest bottoms. Our stock yards and packing houses will have to be multiplied enormously to meet the emergency. Let it once be understood that the cattle raisers of Texas have made up their minds to patronize the home packeries to the fullest extent of their capacity, and we shall have the Armours and other mammoth packing millionaires in our midst, seeking for plants, and the great capitalists who handle the product will also be here and afford you a market at your own door that will enable you to at least retain a fair proportion of the profits of the industry.

"When these changes come and the cattlemen of Texas begin to realize the magnificence of their princely estate, and the grand possibilities of organized power and intelligent management, your association will number many thousands in its membership, and aggregate a volume of wealth, intelligence and physical forces that will give you control of the business of the Southwest, if not of that entire empire west of the Mississippi River, and enable you to select your own markets, domestic and foreign, and name your own prices."

The report of the Executive Committee showed a healthy financial condition. It also showed that 2,221 head of cattle had been taken up or otherwise recovered, sold, and the proceeds handed to their owners. Also, that 1,792 head had been returned to owners, with an additional 146 held pending investigation, making a total for the year of 4,159.

The 2,221 head of cattle sold realized the sum of $36,394.57, being an average per head of $17.28. The remaining 1,938 cut, at the same price per head, would realize $33,488.64, making a total value of cattle caught by the association of $71,883.21, against a total value of cattle caught for the year previous of $58,357.26, showing an actual increase of saving to members of this association, of $13,525.95. This work was accomplished at an expense of $37,074.13, against an expense for the year previous of $35,488.04, or an increase in expense of only $1,586.09. In other words, the increased savings of $13,525.95 has cost the association only $1,586.09. Again, we find that the total cattle caught this past year, amounting in value to $71,883.21, only cost an expense of $37,074.13, thus showing an actual saving, in dollars and cents, of $34,809.08.

Following is the list of inspectors, with the number of cattle cut by them:

T. J. Poston, Chicago	397	Price Dockery, Lamar, Colo.	11
V. W. Allen, Colorado	246	J. N. Hewitt, San Angelo	4
G. W. Waddell, Chicago	6	George Montgomery, St. Louis	17
B. F. Denison, Kansas City	722	W. S. Moore, National Stock Yards	188
J. J. Stewart, Fort Sill, Okla.	33	W. N. Huff, New Orleans	3
T. W. Snow, National Stock Yards	17	Perry Griffen, Oklahoma, Okla.	4
W. L. Calahan, Midland	670	J. M. Barkley, Chickasha, I. T.	215
S. V. Edwards, Cotulla	49	M. H. Beetham, South Omaha, Neb.	7
D. G. Franks, Eagle Pass	24	J. C. Loving, Secretary	3
J. O. Taylor, Beeville	8	Eugene Logan, Clayton, N. M.	240
C. E. Martin, Victoria	26	W. G. Crump, Calumet, Okla.	39
W. L. Lyons, Canadian	380	L. M. Barkley, Wichita Falls	90
W. F. Sims, Cotulla	1	Eli Moore, Wichita, Kan.	8
John Graham, Woodward, Okla.	119	J. B. Franklin, Beeville	6
H. E. Siders, Amarillo	292	A. L. Chesher, Seymour	37
W. H. Keen, Wichita Falls	129	B. W. Stewart, Clayton, N. M.	42
J. W. Holt, Eddy, N. M.	143	F. A. Gallagher, National Stock Yards	29

In this connection the attention of the association was again called to the work that has been accomplished by the association since the establishment of the protective and detective system, and there was added the table giving the number of cattle caught during the past twelve years, their value per head, and their total value:

DATE.	Cattle rendered.	Market.	Trail and shipment.	Total Cattle cut.	Value per Head.	Total Value.
1883-84	730,000	. .	500	500	$35 00	$18,500
1884-85	766,000	344	500	853	25 00	21,325
1885-86	744,000	325	819	1,144	20 00	22,880
1886-87	520,000	191	625	1,016	16 00	16,266
1887-88	469,000	275	556	333	14 53	12,026
1888-89	500,000	. .	. .	691	15 00	10,365
1889-90	600,000	490	333	823	15 30	12,600
1890-91	650,000	844	577	1,421	14 83	21,073
1891-92	750,000	941	906	1,847	16 20	21,941
1892-93	1,100,000	1,749	791	2,540	14 94	37,963
1893-94	1,381,873	2,180	1,404	3,584	16 28	58,357
1894-95	1,385,303	2,221	1,938	4,159	17 28	71,883
Total number caught			19,411	Total value		$319,249

"In the face of bad times in the cattle business," the report went on to say, "the association has to congratulate itself on an increased membership again this year. The total membership now stands at six hundred and ninety-five, or an increase of over one hundred members during the year; and it is a noteworthy fact, evidencing the good work that has been done, and the confidence stockmen have in the efficiency of the association, that while some names have been taken from our lists, with the exception of perhaps half a dozen, this has only occurred where the old members had retired from business. As an evidence of the interest taken in the association by its members, we would specially call attention to the fact that out of a total assessment and dues for the past year, amounting to $35,340.88, our books show only a delinquency of $797.08, and of this amount we are confident the greater part will be collected during this meeting. We do not believe that any other association of the magnitude of this one, composed of any class of people, can make a better showing than this.

"With the slightly increased funds in the hands of the association, it has been enabled during the past year to reach further out into territories where hitherto, for the want of sufficient funds, we were not able to reach; the result being, as can easily be seen from the foregoing, that a greater number of cattle have been caught than in any other previous year during the existence of the association, and we

are satisfied that if all members would make a proper rendition of cattle owned by them, thereby increasing our revenue, that the association could still extend the good work it has been doing.

"The principal field of operation by the thieves, we find to be along the border lines of the State and in the Indian Territory and Kansas. On the ranges in Texas, New Mexico and the Territory, we have been compelled, during the past year, to send out regular outfits to round-up and cut burnt and stolen cattle. In one work alone in the Territory, extending to about fifteen days, we cut about one hundred and seventy-five head of burnt cattle, every one of which, except one head, was identified by the owner. We further find that since the feeding industry has developed in Texas and the Territory, that we are compelled to inspect the feed lots. Only quite recently we found in one pen, in Sherman, Grayson County, sixteen head of cattle belonging to members of the association, sold to feeders without the authority of the owners. We recite these facts to impress upon the members the magnitude of the work that this association feels called upon to do, and to bring to their minds more forcibly the necessity of increased revenue.

"Our prosecutions have been as vigorous as it was possible to make them, and, as an evidence of the fact, we have sent during the year twelve thieves to the pen, a greater number than in any previous year, and now have pending in various parts of this State, and in Kansas and Indian Territory, thirty-four cases. These prosecutions and convictions have been had at an expense of $1,287.02, less than our expense for attorneys' fees and litigation in the previous year.

"We would like to impress upon our members the importance of reporting to the Secretary all sales of cattle, when sold, to be held on the range or in feed lots anywhere, giving number and class sold, to whom sold, on what range they will be kept, and what brands the purchaser places on them. This information, made promptly at the time of sale, will save much trouble and confusion between our inspectors and the owners, and the original owners of the cattle.

"Your committee has pleasure in reporting that after the consultation it had last year with a committee of the commission merchants, regarding the handling of cattle cut in the markets, there has been some improvement, at least by some commission firms, in more speedy settlements of our claims. Your committee feel, however, that a still greater improvement could be made in this direction, and it would recommend that a committee be again appointed at your meeting to confer with the commission merchants, now attending this meeting, and see what further improvement can be attained.

"We recommend that Article 12 of our by-laws be amended by adding the following:

"'Article 12a.—It shall be the duty of the Secretary to collect from the owner all pasturage paid by this association, or for which it has become liable, upon cattle belonging to members of this association, and caught by inspectors of this association, and held by such inspectors on pasturage.'

"That Article 14 be amended by adding thereto Article 14a, as follows:

"'Article 14a.—No member of this association shall render any brand to this association unless he owns or controls all the cattle in said brand.'

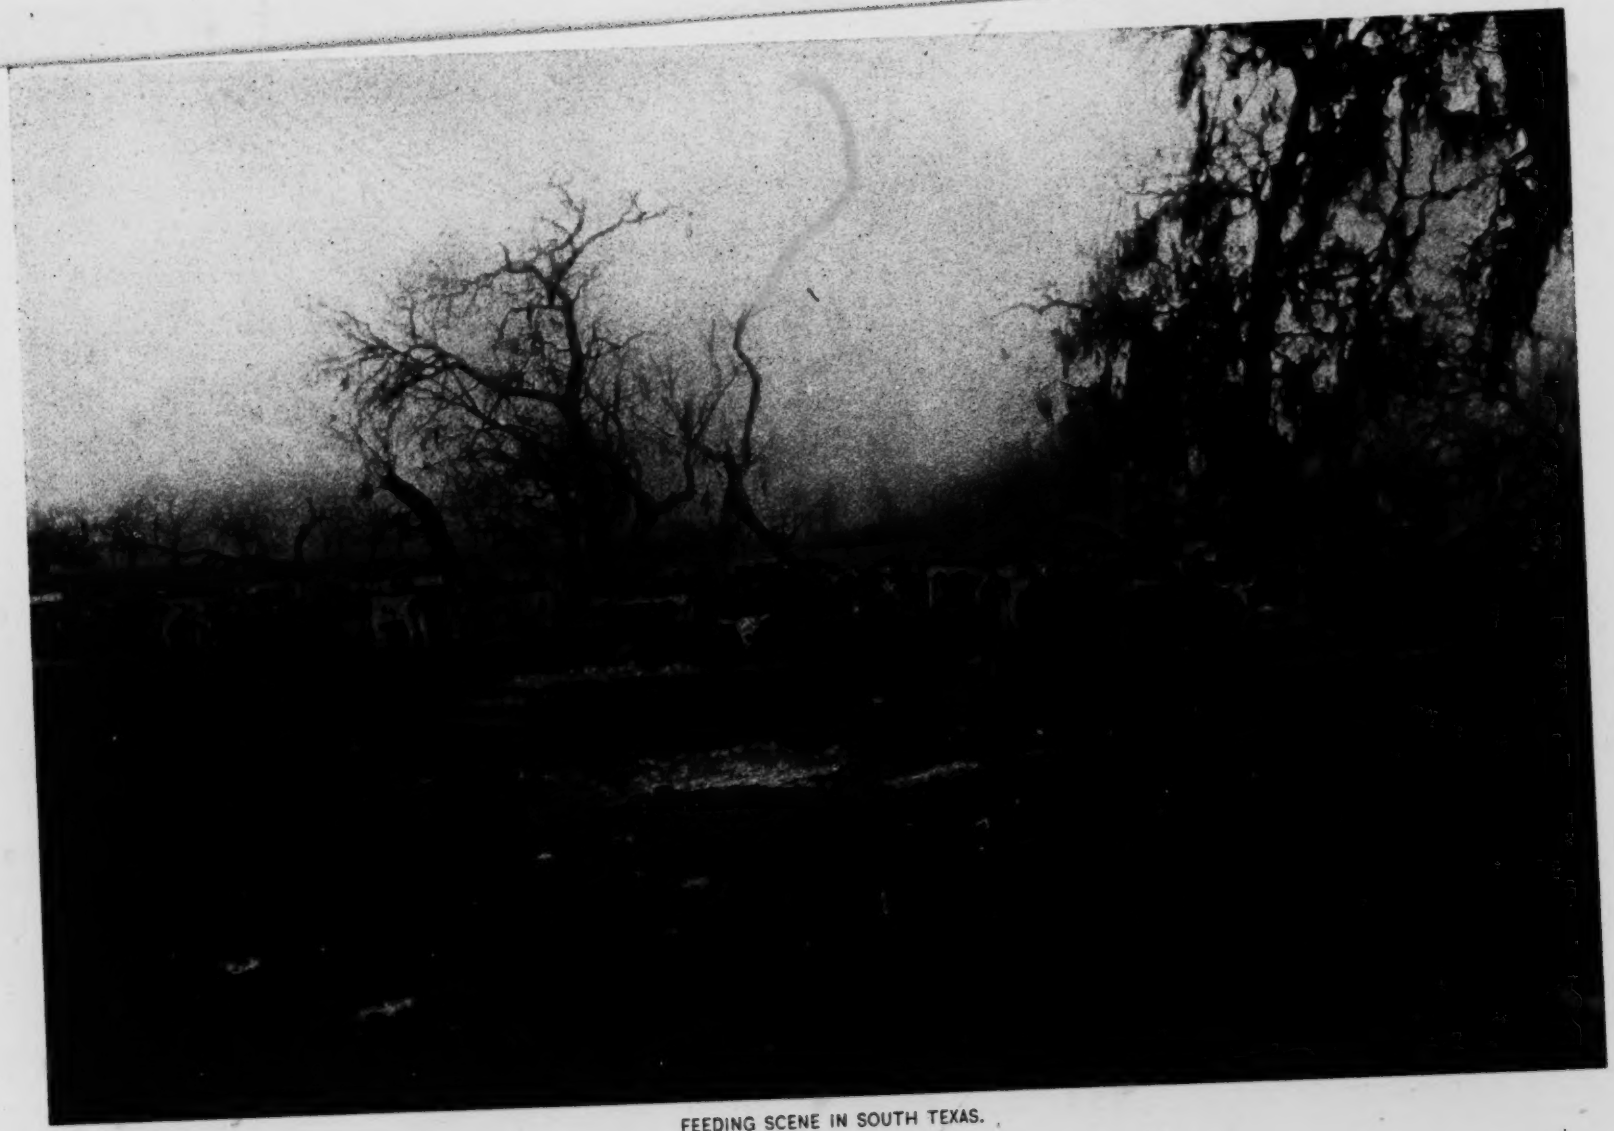
"That Article 18 be amended by adding thereto Article 18a, as follows:

"'Article 18a.—When a member of this association wishes to discontinue his membership in the same, he must notify the Secretary of such intention, and pay his indebtedness to the association up to the date of his withdrawal; on payment of such indebtedness, the Secretary shall furnish the member so withdrawing with an honorable discharge from the membership of said association, provided there are no charges against such member for violations of the by-laws, rules and regulations of the association.'

"We recommend that the resolutions now appearing as an appendix to our by-laws Nos. A, B and C, be made a part of our by-laws, and appear in our by-laws as Nos. 28, 29 and 30, and that the article now appearing as No. 28 appear in future as Article No. 31.

"We recommend that Article 21 of the by-laws, rules and regulations be amended by adding thereto Article 21a, as follows:

"'Article 21a.—Any member of this association under indictment, or other legal accusations of theft, may be suspended from the association at the discretion of the Executive Committee, during the pendency of such accusation, and in the event of the conviction of any member of the association of the crime of theft, the Executive Committee may, at its discretion, expel such member from the associ-



FEEDING SCENE IN SOUTH TEXAS.

LIBRARY

ation, provided that all such cases of suspension or expulsion by the committee shall be subject to review, on appeal to the association, at its first annual meeting thereafter.' ''

The report was received and adopted, and the various recommendations agreed to.

Mr. Sanson, of Alvarado, read an important paper on cattle feeding, saying that the "history of Texas feeding up to the present is of little interest except as an object lesson, guiding us in our future course and enabling us to engage in the business with the intelligence that leads to profitable results. That cattle feeding in Texas has, in many instances, been carried on in a manner almost reckless, will probably be conceded by all who have had occasion to investigate the subject. It seems to be a well-established fact that the feeder of Texas cattle will stay in the business, regardless of the cost of cattle or feed, as compared with the often low prices in the markets on which he must depend to dispose of his cattle. The feeder, as is often the case, often paying more for his cattle than they would bring on the Eastern markets at the time of purchase, must work with intelligence and skill if he looks forward to even a low rate of profit.

Tree in Graham, Tex., under which Kit Carter, J. C. Loving, C. C. Slaughter and others first discussed the organization of the Texas Cattle Raisers' Association.

"Hereafter, the raisers of cattle must largely depend on the feeders of Texas for a market, or do their own feeding, for there are few localities in the State in which the grass will finish the cattle ready for market at anything like remunerative prices. Viewing the cattle feeding of the future from this point, it will be found necessary to inquire into every detail, both as to the quality of the cattle and the kinds of feed that will secure the best results. This brings us to what I regard as the most important factor in developing the greatest and the grandest feeding country on the American continent. It is impossible for a feeder, however skillful, to make a good quality of beef without the proper material to begin with. Hence the future of cattle feeding in Texas depends more on the raiser than on the feeder. If the Texas feeder is furnished with good, well-bred cattle, he will pay remunerative prices for them, and on his part will make a quality of beef that will compare favorably with any produced in the United States. We produce in abundance every kind of feed that can be grown in other States; and have the further advantage of making one-third of all the cotton seed grown in the Union, a feed not produced at all by any other cattle-raising State.

"I hope to be excused if I seem to lay too much stress on the quality of cattle necessary to make cattle feeding a success in this State. Let the raiser of cattle furnish well-bred steers of good style and quality, and Texas can be depended on to furnish the best kinds of feed, and in abundance sufficient to feed every steer raised in the State. Then it will be left with the feeder to adopt the best methods of feeding and maturing beef of the very best class and quality. I feel confident that every feeder will then be forced to do his best or go out of the business.

"I have heard the statement made by experienced feeders that in no instance has a strictly cold-blooded Spanish steer ever made a feeder one dollar of profit, and my own experience in handling blooded cattle will not incline me to take issue with the above assertion.

"As evidence that the feeder will pay a good price for good cattle, I cite you to several feeders in Texas who have paid as high as thirty to thirty-five dollars for their cattle this season, while many common cattle have gone into feed lots at from fifteen to seventeen dollars. Much more might be said of the necessity for well-bred cattle to make future feeding in Texas the success it should be. I do not wish to be understood as saying that Texas produces no good feeders. There are many such raised here, and the sales of Texas cattle, properly fed, when compared with natives, show their standing and merit in the Eastern markets.

"Much may be said on the subject of feeding—the best kinds of feed, the manner in which given, the quantities and proportions to produce the best results most economically. It would take a long article to go into all these details. Besides I am to say something on the subject of cotton seed and cotton-seed meal and hulls, as to the relative merit of cotton-seed meal and hulls. The most reliable figures obtainable place the number of cattle fed on meal and hulls the present season at about two hundred thousand, and on cotton seed, thirty-five thousand. This fact of itself would seem to settle the question in favor of meal and hulls.

"Yet we must admit that seed when properly fed on grass will make as good beef as any other we have used in Texas. That the feeders of Texas in the past have made more money out of seed than any other feed I do not question. Yet the future use of raw cotton seed in Texas I do not think of importance enough to discuss at length. For many reasons it is going out of use. Chief among these reasons is the fact that seed can only be fed successfully on good pasture, and good pasture land in the cotton-raising districts of Texas is now too high priced to admit of its use as pasture alone. Another, and perhaps the main, reason for abandoning the use of raw seed was the sharp competition between mill men for the last two years, putting seed practically out of the reach of feeders. Yet, should the present low prices of seed continue, it will, doubtless, cause many feeders to return to the use of raw cotton seed; especially will this be so where pasture lands are cheap and in reach of the seed. There are many feeders who will never abandon seed for any other feed so long as they can get them laid down in the pasture at six to seven dollars per ton, and, judging from past experience, such feeders' chances for staying in business are quite as good, or perhaps better, than those of his neighbor, who uses any other kind of feed.

"As to meal and hulls, in order that you may realize to what immense proportions the industry has grown in so short a time, I give a short history of the enterprise. In 1834 the first mill was built at Natchez and was a failure. In 1847 Frederick Good, of New Orleans, made another venture at a heavy loss. In 1857 Mr. Paul Aldridge, of New Orleans, went to Marseilles and watched the manufacturing of the Egyptian seed and the machinery used, came back to New Orleans and established a mill, but found it difficult to induce the farmers to load up their seed and take them to his mill and the various shipping points, they thinking only of the cotton and considering the seed of too small a business to bother with. So with eighteen months' hard labor, with men traveling over the country horseback, he secured only 1,764 tons. Later the mills found the hulls accumulating, and it was with considerable expense that they were carried off and dumped into low places, that being the easiest way to dispose of them. During the war feedstuff became scarce in Mississippi, and the farmers were compelled to allow their cattle to graze off the hulls that had been thus disposed of, and to their surprise the cattle thrived.

"In 1866 there were only seven mills in the United States; in 1872 there were 26; in 1880 there were 45, and now we have 205, of which Texas has 84. The crush of the United States is about 1,500,000 tons, Texas crushing about 700,000 tons, this making an average of 500,000 tons of meal and cakes annually in the United States, and 250,000 tons for Texas alone. Previous to the '80s, our meal and cake were sent principally to Europe. About 1881-2 New England began to take our meal as a feed-stuff for cattle, and by 1887 it was being largely used there, and its value was becoming generally known throughout New England. About 1880–5, the dairy people of Memphis and a few cattle feeders were using meal and hulls extensively.

"The feeding of meal and hulls began in earnest in Texas about 1890, and now we make in Texas alone enough hulls to feed 185,000 to 200,000 head of cattle, and meal enough to feed 600,000 cattle. Thus it will be seen that by supplementing the hulls with sorghum, straw and ensilage—to say nothing of feeding the meal on grass, which is now done successfully—it is possible for Texas alone to feed 600,000 cattle on the products of cotton seed. All this comes under the head of the possibilities of the future feeding of cattle in Texas."

Col. C. C. Slaughter, of Dallas, proprietor of the "Long-S" ranches in Texas and Montana, and who owns in the neighborhood of fifty thousand head of cattle, had this to say: "Meal is said to be the finest feed in the world, because it gets cattle ready for market in from eighty to ninety days. I have tried it only once, and that was last year, at Greenville. Stock fed on from five to seven pounds of meal and from thirty-five to forty pounds of hull per day, will fatten faster than cattle on any other feed in the world. I do not think there is any doubt about that. The reason is that there is so much more oil in the meal than there is in the grass. No matter what process is used, all of the oil in the seed is never extracted. You can take a handful of hulls after they come from the mill and grease your hands with them. When it comes to condition of meat, meal-fed cattle are as tender as any beef you ever tasted. And my experience is that they are just as healthy. I had some cattle fed on meal and hulls to go blind and get sick after having been fed too long, but the disease was due more to an excess of fat than to any other cause. I do not believe it was caused by anything in the meal. A man has the gout from eating and drinking fine things, but that does not prove that what he ate was poisonous; on the contrary, it may be very wholesome. Feeding on meal does away with the necessity for winter grass. A raiser can get meal just as soon as the mills open for business in the fall, and by the new year he has his cattle ready for market. One objection to the feeding on meal and hulls exclusively is that all of the cattle fatten about the same time, and get to market about the same time. It seems to me if we could feed them lightly on meal during the winter and turn them out on the grass in the spring, it might be well. I do not know how that plan would work, because I have never tried it, but I have had a notion of experimenting with it. I believe that after they got fat on the meal and hulls, they could keep their fat on the grass, and then the market would not be periodically glutted and relaxed. There may be found many ways in which meal and hulls may be merged into a combination feed to the great benefit of the business. All that will come later on, because the use of meal and hulls and cake in any shape is largely a novel one, and we will have to have more experience before we discover all of its uses."

Mr. Winfield Scott, of Fort Worth, is feeding twenty-one hundred steers this year. Asked for his experience, he said: "I have been feeding cattle on meal and hulls for three years, and there are no better cattle on the face of the earth. I have tried it in the pens and in the pasture, and I believe the best way to feed is for a man to put his meal and hull troughs right in his pasture, so that cattle can get some grass once in awhile if they want it. From five to seven pounds of meal a day will get a steer in fine shape in from ninety to one hundred days; whereas, if he is left on the range all winter to hustle for grass, he will not be ready for market before July or August. If there is any difference in the quality of meat it is in favor of the meal steer, because there cannot be any better meat than that. It is as tender and juicy as a bird, and always as salable as grass-fed stock. The feeding business is growing wonderfully in Texas. Oil mills are going up all over the State, and the supply of meal and hulls has quadrupled in the last four or five years, and still the demand keeps on, outgrowing the capacity of the mills. I have no way of telling how many cattle are fed on meal in Texas, but it must be close to two hundred and fifty thousand, if not more than that."

Mr. W. T. Waggoner, of Decatur, whose father, Mr. Dan Waggoner, is one of the pioneers, as well as one of the most successful cattle raisers in Texas, said: "We put two thousand on meal last year, and they were the finest lot of steers my eye ever rested on. We fed them ninety to one hundred days, and then sold them. When they got to market every one of them averaged over thirteen hundred pounds, and we got $4.25 and $4.50 for them, too. We fed them on meal and hulls. The meal was for a fattener and the hulls for a distender. It would have taken us at least one hundred and twenty days to have got those cattle ready for market on grass. I don't exactly remember the proportion, but I think it was one pound of meal to seven of hulls. They had a big jollification at Decatur, and father

gave the boys a meal-fed steer to barbecue. Farmers for ten miles around came to the house to know what we had been feeding that steer on. They said they had never tasted such beef before in their lives. We killed one at home and the beef was so tender it just melted in our mouths. I always thought it was mighty hard to beat chicken, but when I tasted that meat I was convinced. Meal-fed cattle are even better in my opinion than slop-fed cattle, and they have always stood at the top of the list. I have tried it, and I know that meal-fed steers furnish just as good and as healthy meat as any class of cattle that ever walked on four feet."

Mr. Burk Burnett said he was not feeding any cattle himself, but twenty-six hundred in which he was interested are being fed at the Ardmore mill by Mr. W. R. Moore. Mr. Burnett added, however: "So far as I have learned results are very satisfactory. Cattle fatten rapidly and that is what we want. We can get meal-fed steers to market in from ninety to one hundred days, while it takes more than one hundred and twenty days to get grass-fed stock in shape. I cannot speak as to the details of the feeding, because it is being done by others. I can tell you, though, that there is a world of cattle in Texas being fed on meal and the number is always increasing."

Hon. T. T. D. Andrews, of Fort Worth, said he was feeding some meal, but he preferred not to be interviewed about it at this time.

Mr. J. W. Hawkins, of Midlothian, said: "I am feeding over two thousand this year. I have found a combination of meal and grass to be better than any other feed. It may take just a trifle longer to get the steers in condition, but they are mighty good when they get to market. Grass is an uncertain quantity, dependent largely upon weather conditions. Besides, it costs something in Central Texas to rent or lease a large pasture. You can always depend on meal and hulls. As soon as the mills open in the fall the supply commences, and from that time till the end of the cotton season in the spring we have a steady supply. It is doubtful if cattle fed on grass can be disposed of at remunerative prices, while those fed on meal and hulls always can be sold to advantage. Feeders lost money last year from a number of causes, but I believe every one of them is coming out all right this season. There can be no question that meal and hulls will fatten a steer quicker than any other food you can give him. As far as the meat is concerned, it is just as good as a man ever put in his mouth. They sell just as readily as grass-fed cattle, and that is the highest and best test. So far as the future of meal feeding is concerned, I believe it has come to stay, and you will see it coming into general use more and more every year."

Robert J. Kleberg offered several resolutions that had been submitted to and approved by the Executive Committee first.

"*Resolved*, That the Cattlemen's Association thoroughly, heartily and unevasively, without any reservation, commend and support the present rigid method of cattle and meat inspection, which we believe is thoroughly enforced by the agents of the Bureau of Animal Industry of the United States Department of Agriculture.

"*Resolved*, That we insist upon the continuation of the said governmental inspection, tagging and certification of all domestic animals for the interstate or export trade, to the end that the whole world may be guaranteed that the domestic animals of the United States are free from all infectious or communicable diseases.

"*Resolved*, That we demand of our Representatives in Congress that they enact laws requiring as rigid inspection and certification by foreign governments of edible commodities exported by them (wines, liquors, etc., inclusive) to the United States, as they require from the Government of this Republic, as to the wholesomeness and healthfulness of American cattle, swine and other products, in whatsoever shape they may be exported.

"*Resolved*, That in the event that Congress be not convened in extra session, that we most respectfully but earnestly ask the President that he take such action as may give the desired relief, as authorized by the fifth section of the act of 1890, relating to the inspection of meats for exports.

"*Resolved, further*, That it is the sentiment of this association which passes these resolutions that these demands are non-partisan, and are made with the request that there will be a general concurrence of expression on the part of all the producers and dealers in live stock throughout the country.

"*Resolved*, That the President and Secretary of this meeting be and are hereby requested to furnish these resolutions to the papers, and also send a certified copy of the same to the President of the United States, and to the United States Department of Agriculture.

"*Resolved*, That the Texas Cattle Raisers' Association most heartily appreciate the action of the Department of Agriculture in its experiments, now being carried on at King's ranch, in this State, in investigating the most effective method of disinfecting Southern cattle so as to prevent their communicating Southern or splenic fever, and that we respectfully ask the Department to continue said experiments and investigations until a thorough test of said methods of disinfection has been made, and that a copy of this resolution be forwarded to the Hon. J. Sterling Morton, Secretary of Agriculture.

"WHEREAS, Believing that the opening of the Nicaragua Canal would redound not only to the great material benefit of the live stock industry of this State, but to the agricultural and commercial interests as well, therefore be it

"*Resolved*, That we request our Legislature now in session to urge our Senators and Representatives in the Congress of the United States to give their active and vigorous support of all proper Federal legislation which will further and promote the speedy opening of said canal.

"WHEREAS, It being most urgent to have the present law, creating a Live Stock Sanitary Commission, revised and perfected, so that it may be made more efficient to effectually accomplish the purpose for which it was created; and

"WHEREAS, There is now pending a bill before the Legislature covering the desired and necessary legislation; and whereas, there is imminent danger of a general quarantine against Texas cattle by the United States government and the other States,

"*Resolved*, That the Legislature be earnestly urged to take up and pass said bill at the earliest possible moment, and that a copy of this resolution be sent by the Secretary immediately to the President of the Senate and to the Speaker of the House of Representatives."

The various resolutions were agreed to.

The election of officers was then in order, and G. W. Fulton nominated A. P. Bush, Jr., for re-election. After several other seconds, T. A. Thompson seconded the nomination, and put the motion that it be unanimously approved, and this was done with a whoop.

President Bush felt the pressure of the oft-repeated compliment too much to attempt an expression of his thanks, but he made a very effective effort, anyway.

C. R. Breedlove had been sitting as quiet as an old mouse in a cheese trap, but he could stand it no longer, though he had intended to keep still. He thought a bachelor was, at best, a disjointed fragment, but the association had found the best specimen of the animal he had ever seen in its President. The speaker had found another good man for First Vice-President—one who was broad-gauged—not one of those little narrow fellows, so narrow between the eyes that if you struck between them with the forefinger you would hit both eyes, but a liberal, energetic man, from South Texas, who had done more good hard work trying to find what splenic, or so-called Texas, fever was, than any man in the State, and that was Robert J. Kleberg, the gentleman from the land of ticks. Mr. Kleberg was elected without opposition.

S. B. Burnett was re-elected Second Vice-President; J. C. Loving, for the nineteenth time, re-elected Secretary; E. B. Harrold was re-elected Treasurer, and the work of the election was done.

At the second day's session, Mr. G. W. Simpson, of the Fort Worth Packing Company, made a speech containing several historical references, which we reproduce. "Thirty years ago Chicago started in with three hundred and ninety thousand cattle annually. There were then no railroads, no steamship lines for taking this product to different parts of the world, and Fort Worth has to-day more than five hundred thousand cattle passing here annually. She can produce the beef at about one-half what Illinois can. Fort Worth is the only great live stock centre from which it is practicable to ship to all of the other great markets in this country and on the other side of the water. In starting from here you can ship to Kansas City, St. Louis and Chicago. It is not practicable to ship from St. Louis to Kansas City, but it is practicable to take Fort Worth and ship to any other spot on the face of the earth, and ship direct.

"The time has come when this product has got to be shipped direct to market in order to make it profitable. The experience of England in the matter of wheat is an example of this. Parliament, after much discussion, decided that they were paying too much for wheat, and asked: 'Why shouldn't we keep some of this money at home?'' The result was that they began to experiment, and to-day the price of wheat is at the very bottom, simply because England is not a buyer. She has transferred her custom to Australia and others of her colonies.

"I was speaking to a gentleman from Chicago, and he stated to me a day or two ago that the people would go down further into their pockets during a panic to buy meat, than for any other thing that there was known in the world that he knew of. That was demonstrated last summer. The banks would lend money to move meat products when they would not lend it out for any other purpose. Now, it seems to me that the thing for Texas to do is to utilize what she has got. She has got at her own door deep water. I don't know which is the most practicable point to ship from. That is for you to decide. There is room for New Orleans, Galveston, Aransas Pass and one or two more. There was two hundred and thirty-five thousand cattle fed in Texas this last year. I think I will be justified in saying that fifty thousand of those cattle were good enough for export. I hope I can say more than that. Six hundred thousand cattle could be fed in Texas on the cotton-seed oil meal. She should export two hundred thousand cattle, and will certainly do it if the present rate of increase is kept up. Whoever lives to see 1900 will see more cattle fed in Texas than in any other country in the world. Texas can produce more meat than any two States in the Union, and produce it very much more cheaply.

"I think these are facts. When you see successful business men start and come down to Texas every year to attend this Convention you are very sure they are not here for their health. You are pretty sure you have got something here they want. They buy your stock cattle for those Northern markets and you turn everything loose and let them go up there. There is a gentleman who has some very fine cattle in Ardmore. They are handled as well as any cattle in the State. I think that he was going to ship some of them to Chicago. They were left over one day in Kansas City. On account of their poor condition there was just one buyer that bid on them. They found their way through to New York and were slaughtered. It is a shame to allow property to be so treated. He might have got a less rate in four days direct by Memphis and Cincinnati to New York. They would not be exposed to any cold until they got to Cincinnati. I simply say that this product that you have got should go direct to the market where it is to be consumed. This would be accomplished if you would offer the cattle here. We need your co-operation in making this the third largest market in this country within five years. You can produce the cattle. There was never a time in the history or the business when every condition was so favorable for the shipment to the home market as it is right now. Although the demand for beef is light on account of the dull business, there has been an advance of more than twenty-five per cent within the last thirty days. There is now a great shortage in cattle. Every market has been sending out circulars trying to get people to ship to them, but they cannot ship the cattle unless they have got them. Instead of sending them to one market and letting them send them to another, they should be sent direct. Chicago is a good market. It is well established and is not going to be affected by anything we do. But what we want is a closer one, from which the product can be sent direct to the consumer. Do not let them be tossed around like a football from one market to another."

After a very enthusiastic conclusion of regular business, it was decided to meet again in Fort Worth next year, although both Dallas and San Antonio were competitors for the honor.

Second only in importance and influence to the Texas Cattle Raisers' Association is the Texas Live Stock Association, which was organized in the city of Austin about four years ago, with a very small membership. Its growth since that time has been rapid, until now it includes within its membership very nearly all the men engaged in the live stock industry in Southern and Southwestern Texas, together with a large number from the northern portion of the State.

The members met in annual Convention in February, at San Antonio, when some very valuable papers were read. Mr. Thomas H. Franklin, in his address of welcome, was strictly practical. He said:

"Mr. President and Gentlemen of the Convention: I bring to you the greetings and hearty welcome of the people of this city. We have taken our front door from its hinges, and the house stands open to receive you. Come in, sit down in our best rocker, put your feet on the jamb of our fireplace, spit tobacco juice on our coals and make yourselves 'to hum.'

"It seems superfluous to welcome a 'cowman' to our city. San Antonio is your natural headquarters. Your interests are its interests, and its interests yours. A large portion of the country tributary to it is only fit for grazing purposes, and must be used by the stock raiser or lie idle. We must look to the ranchman to make such lands productive. Every calf raised on them adds somewhat

A HEADQUARTER RANCH.

to our wealth. Even the hide from the starved steer has for us a value. Your cows never get so old or poor that our butchers will not buy them, and as a market for tough stags San Antonio has no equal in the world.

"In the utilization of these grazing lands the cowman struggles with drought, fights with the summer's heat and contends with the winter's cold, and he is entitled to our sympathy, and to him is due our aid and encouragement. The cowboy and the shepherd are the advance guards of civilization. All new countries are pastoral before they become agricultural, and agricultural resources are developed before manufactories appear. The man with the rope always precedes the man with the hoe. The cowpony beats a path across the prairies before the sod feels the point of the plow. This is as true to-day as it was in the days of the patriarchs. The farmer follows ever at the heels of the stockman, and wherever new land is found fit for cultivation, the tiller of the soil soon seizes hold and turns pasture into farm.

"The history of the cattle industry in this State demonstrates the truth of the preceding assertion. Not many years ago your herds covered the plains and valleys, but the farmer found that beneath the waving grass there was a soil that would raise wheat, corn, oats and cotton, and he came with his plow, and you moved further on with your cattle. Whatever he asked of the State, in the way of restricting your right to acquire land and enlarging his privilege to obtain it, he got. The twelve acres necessary to raise a cow, if fit for cultivation, will produce more wealth for the country if utilized for agricultural purposes than if used for grazing land. A wise public policy demands, therefore, the use of agricultural lands for agricultural purposes. The farmer is in the majority, and majorities rule. In a contest for occupancy of tillable land the cowman must succumb to the farmer. Victory to the cattleman in such a contest would be barren of good results, for it would not pay him to raise one cow on twelve acres of land when he could turn farmer and grow at least four bales of cotton or two hundred bushels of wheat on the same land. In the future, cattle raising as an industry must be carried on upon the uncultivable lands of the State. We must look to the cattlemen to make those lands wealth-producing, and there is no city more interested in the successful utilization by you of such lands than San Antonio. The farmer is likewise directly interested in the use by you of those untillable lands for grazing purposes. In connection with his farm he can raise a few calves. It will not pay him, however, to hold and feed them until they are marketable as beeves. Our cities are not large enough to constitute veal markets, and he cannot afford to ship his veal to the larger cities of the North in competition with the small farmers of that section. He needs, therefore, a home market for his calves. This the cattlemen can give him if the bodies of grazing lands heretofore referred to can be successfully utilized by him.

"How to accommodate the cattle industry to this new condition is a question before you for solution, and we are all interested in its successful solution by you. I believe in your capacity to successfully solve the problem. A cowman generally meets any emergency that presents itself. When Laban attended the first 'round-up,' after he had traded with Jacob, he found that most of the spring calves belonged to Jacob. Let me suggest one matter for your consideration, however. These barren lands must be used in large bodies in order to prove profitable, and it will take large capital to so use them. Individuals will hesitate before they will risk all their capital in any large undertaking. The tendency of the times is to push such enterprises by combined effort and capital. No one man would undertake in this day to build a railroad, establish a factory or engage in a mining enterprise. This tendency is recognized in the legislation of this State, and the creation of corporations permitted to construct roads, build bridges, run ferries, maintain stage lines, supply water and gas, to manufacture and mine, to sell merchandise, to establish hotels, to grow and sell seeds, trees and other articles for agricultural and horticultural purposes, and to hold lands for such purposes, and to do many other things, including even the burying of the dead. The cowman, however, is not permitted to incorporate for cattle-raising or pasturing purposes. In view of this condition, can individual enterprise successfully utilize the untillable lands of Texas for cattle-raising purposes? If not, these lands must cease to produce wealth, or the State must permit the creation of corporations for their utilization.

"I am aware that to many the word 'corporation' causes more terror than did Banquo's gory locks to Macbeth, but we are living in a material age and in an era of close competition, and beautiful theories must go down before sturdy facts. The modern Mohammed no longer calls to the mountain; he goes to it, burrows through it or marches over it. When the rushing river dashes away the bridge of solid masonry that spans it, we do not rebuild the bridge on the same plan, but swing high above the reach of the waters a structure of steel, seemingly as frail as the web of a spider, but in reality so strong that it easily withstands the pounding of the wheels of many loaded trains of cars daily.

"If, therefore, the choice lies between the death of a great industry and a new life being given to it by changing the methods by which it may be conducted, should we hesitate in our choice? When the nose is cut off to spite the face, neither nose or face is benefited by the operation.

"You will better understand than I do whatever of value there is in my suggestion, and I submit it without further argument."

A. P. Bush, Jr., of Dallas, President of the Texas Cattle Raisers' Association, responded to the address of welcome. He spoke of the kindly feeling entertained by stockmen toward San Antonio, and said they all felt at home in the Alamo City.

In the course of his address Mr. Bush furnished the following figures relative to the cattle industry in Texas:

The total acreage of the cattle district in one hundred and thirty-five counties, including the coast counties, is 112,249,600 acres. Total cattle rendered in same in 1890, 4,451,760. Total cattle rendered in same in 1894, 3,149,550. Total number of acres owned by State August 31, 1894, 21,688,622. Total number of acres leased and in good standing August 31, 1894, 4,757,179.

Average number of acres for each head of cattle in the range or cattle district of Texas, Comptroller's report for 1890, was 24.25. Average number of acres for each head of cattle in the range or cattle district of Texas, Comptroller's report for 1894, was 35.65. Decrease in number of cattle in above district from 1890 to 1894, was 1,302,330, showing 41.34 per cent more in 1890 than in 1894.

These renditions were made in the spring of 1894, before stockmen realized the extent of the losses during the winter and spring of 1893-94.

The above counties contain sixty-five per cent of the area of the State. In 1894 above counties contained seventy-one per cent of the cattle of the State.

In 1892 it was estimated that Western Texas contributed to the support of the State Government in taxes $300,000 more annually than she received back in the distribution for current expenses. Since the report of the Commissioner of the General Land Office, August 31, 1894, from which the statement of lands leased and owned by the State was taken, there have expired, been canceled and subject to cancellation of leases up to February 5, 1895, 1,438,907 acres, which would reduce the lease above to 3,318,372, as the bulk of these cancellations is in the counties named above.

Added to lands owned by State August 31, 1894, 21,688,622, are forfeitures for non-payment of interest for 1893, under the act of 1887, reported February 1, 1895, 2,278,400. Total now owned by the several funds, 23,967,022, of which there are now leased and in good standing, 3,536,818, leaving non-revenue producing, 20,430,204.

Total school lands, 23,967,022 acres, at two cents per acre would produce an annual income of $479,340.44. Now producing under present laws, $187,978.76. Annual loss, were all the lands leased at two cents, $371,361.68.

Secretary George B. Loving, brother of the Secretary of the Texas Cattle Raisers' Association, read the annual address of the President as follows:

"I congratulate you upon the improved condition of the live stock industry of our State since our last Convention. At our last annual meeting it was estimated that Texas had two hundred thousand head of cattle on cotton-seed meal, and that these cattle would lose to their owners an average of ten dollars a head, or two million dollars. This season it is estimated that another two hundred thousand Texas steers are being fed on cotton-seed meal, and that the average net profit on these cattle will be ten dollars a head, or a total of two million dollars. The difference between the loss of two million dollars one year ago and a profit of two million dollars for the present feeding season makes a difference of four millions dollars—quite a little sum when we consider that the cattle-feeding business represents only one department and one special feature of the great live stock industry of the State. Not only are the cattle feeders in a prosperous financial condition, but the ranchman, the speculator, the shipper, dealer and all others connected directly or indirectly with the cattle business have, with few exceptions, had a prosperous year and are well satisfied with the results. The cattle business has probably been the most profitable branch of our live stock industry for the past year; yet with splendid seasons, an abundance of grass and all other conditions reasonably favorable, the sheepmen, the horse raisers and the hog growers have been reasonably prosperous, in fact remarkably so, as compared with other branches of agriculture.

"I also congratulate you on this our fourth annual Convention, on the growth and prosperity of our organization. Three years ago our association was organized in the city of Austin, with a small membership indeed. The few who then put their shoulders to the wheel have worked faithfully and industriously to further the objects and promote the welfare of this organization until, notwithstanding

serious droughts and financial panics through which it has passed, our association is to-day in a flourishing and prosperous condition, and has been instrumental in doing much good for the industry it represents. The good work of our association, however, has just begun. It will become more useful and of greater value to the live stock interest with each succeeding year, provided the stockmen will give it their moral and financial support.

"Looking back over the year just closed, and anticipating the one that has just begun, I can see naught but cause for congratulation. In the throes of a nation's, aye, a world's, financial struggle, the live stock interest, in company with every other industry, has suffered; but, I am glad to say, that by actual comparison not in the same marked degree as other and less stable industries. Throughout the great financial crisis there has never been a time when the owner of live stock was in danger of wreck and starvation, and during 1894 the cattle values, and swine values especially, were higher in comparison with other industrial products than gold was over silver. The Texas stockman, more than his fellows of other States, has peculiar cause for congratulation. The many changes which the live stock business has undergone during the year gone by has in each and every instance been to the advantage of the Texas stock raiser, and what has been the loss of the stockmen of other and less favored sections of this great country has been the Texan's gain. The last half of 1893 and the first half of 1894 held forth but little promise to the Texas stockman. A general drought, a paralyzed money market, extended labor troubles, high prices of feed and the losses of years before, caused him to grow sick at heart when he contemplated the future. A change, however, the past summer, brought abundant rains to the greater part of the State. In an incredibly short time we had excellent grass and crops in abundance that the farmers have not even to this hour been able to finish harvesting. Labor troubles were suspended, the laborer resumed work, and as working people must have meat, a demand was created for Texas' supply of this commodity. The banks opened wide their coffers of hoarded wealth, and invited the business of the stockmen. The country has been scoured from one end to the other for cattle, for hogs and for sheep to eat the great surplus of stock feed the State produced; and on account of the great quantity and the resultant reasonable prices asked by the feed raisers, feeding has been done at a profit, and, as above stated, the net profit on all cattle fed this season will probably average ten dollars a head, as against a loss of that amount a year ago. The development of cattle feeding in Texas has been one of the most wonderful and happy transformations that ever befell an industry. You are all familiar how, ten years ago, cotton seed was considered a waste product. It was a problem in the minds of the cotton raisers how easiest to get rid of the seed that piled up around the gins. Angered by his customers' refusal to haul them away, the ginner made fuel of the seed for his boiler furnace. Now the seed is of more value than the staple. The cotton seed crop of this State in 1894 would, if properly applied in that direction, fatten one million five hundred thousand cattle in ninety days' time. A few years back fed Texas cattle were a rarity; now, under the sway of cotton seed product, the people of the corn-growing States complain that the fed Texans have ruined the native market. Where Texas in former years furnished only grass cattle, fit only for canners, and shipped them all out in a few certain months of the year, she now ships each month in the year, and seven hundred and fifty pound longhorns have been replaced by the twelve hundred to fourteen hundred pound grades. Five years ago Texas raised feed for twenty-five thousand head of cattle; now she can fatten each year one million five hundred thousand head.

"But, as in all good things, the Texan will not be allowed to enjoy a monopoly of cotton-seed meal for cattle feeding. The feeders of other States have, I am credibly informed, used more than two hundred car loads of cotton-seed meal for feed from Texas alone, and from all reports they are enthusiastic over its success, and when another cotton season comes around these Northern feeders will be in the field as sharp competitors for the purchase of cotton-seed meal.

"Above all the benefits of cheapened feed and its use by the stockmen of Texas in preparing their stock for market, the lesson that they have learned and which will in the end bring them more and better returns than any other feature, is that of improving their stock. The greatest disadvantage that the Texas stockmen of every class have had to labor under in their competition in the markets of the world has been the inferiority of their stock. In days gone by the word Texan, as applied to live stock, was synonymous to scrub, and the longhorn cow, the scraggy, straight-wooled sheep, the

razor-back hog and the wiry, broom-tail broncho had each their natural habitat in Texas. Now, by force of the lessons learned by coming in competition with the thoroughbred and improved stock of other States, the Texas stock raiser has realized the importance of good blood, and is continually improving his stock by the infusion of better blood, until in a few years it will require a label to distinguish a Texas shipment of live stock from the boasted natives of other States.

"I will not trespass much longer on your time. I might tell you something of the better things that are in store for the Texas stock raisers through the establishment of packing houses in different parts of the State. The tendency of the great cotton manufacturers of the country is to move to and locate where the supply is produced. So it will be with the packeries, and when with deep water on the Gulf Coast, ships of heavy tonnage will steam for foreign points laden to the water's edge with meats from Texas slaughter houses, we will have but attained what is now in sight. My attention was early directed to the beef packing business. In 1867 William Gifford & Co., of Chicago, started a beef packery at Columbus, Tex., my brother and myself furnishing the greater part of the beef slaughtered. This, one of the earliest experiments of the kind for our State, was made by Messrs. Gifford & Co. under great disadvantages. There were no ice factories in the South and the refrigerator methods of to-day were unknown. Transportation was insufficient and likely at any time to become blocked, and the methods for feeding and handling stock were not perfected as they are to-day. The consequence was that the first year the enterprise was not a success and the second year wound up the business.

"Many experiments have been made since, and with few exceptions the same results have followed. Our attention being closely directed to this first venture caused us to study the succeeding enterprises closely, and they failed in our judgment mainly for the following reasons:

"First. A want of sufficient capital.

"Second. A want of sufficiency in the quality of beef to meet the demands of the business through the winter and spring months, when our Texas cattle that are not fed are too poor to slaughter.

"Third. A want of proper facilities in the way of transportation, rates, etc.

"There have been several efforts made to get sufficient capital on the co-operation plan by inducing cattlemen to take stock in the enterprise. All of these methods have failed, and in my judgment they must fail, for few stockmen are in condition financially to take stock to any great extent in such enterprises, besides enterprises of this character are very distinct from the line of business the producer follows and must be directed by methods with which the producer is unfamiliar. There must be a good business head, combined with experience and a sufficiency of ready and unhampered capital to meet any demand or exigency that might arise.

"With additional beef packeries, similar to the one now in operation at Fort Worth, located where refrigerated beef could be transferred to the cooling apartments of the steamers and shipped direct to foreign ports, Texas would begin to solve the problem of marketing her cattle without the heavy freight and expenses of dumping them in Chicago. I believe the opportunity to be now at hand and that it is the only relief within our reach for marketing our cattle at a reasonable price. To accomplish this we must induce capital to take hold with sufficient means and capacity to use the home supply and in some measure meet the demand and influence the business in foreign markets.

"Before closing, I want to impress the members of this association and the stockmen generally of Texas, with an idea, upon the fulfillment of which depends much of the future greatness of the live stock industry of the State, and it is in the strengthening and perpetuation of this association. The universal law of self-preservation finds its safest method in the organization of classes, and the Texas stockmen have been slow in coming together in an organization such as this is, because, that until within the past few years, the range and feeding live stock interests had but little in common. Now they are a part and parcel of each other—the range stockman looking to the farmer to raise feed for his stock, and the farmer looking to the range stockman to purchase his surplus feed. There is not a man present who will live to see the time when one of the leading industries of Texas is not stock raising, not only as an adjunct to farming, but as a range industry. But the interests of the stockman and farmer are, and ever will be, identical, and these same interests can best be conserved and promoted by organization. I would respectfully urge on every member present the necessity of securing members,

not only among exclusive stockmen, but stock farmers as well. The work of organization should be pushed with vigor."

The following report from the Executive Committee was read and referred to the proper committee:

"To the Officers and Members Texas Live Stock Association: In accordance with established usage, your Executive Committee submits the report of its acts for the past year, and also certain recommendations which we submit for your consideration.

"The committee has had but two official meetings. November 30, 1894, upon call of the chairman, we assembled in the city of Waco, and, after due deliberation, we adopted the programme of exercises to be observed at the annual meeting of the Convention.

"At the meeting our lease committee submitted the proposition whether or not it would be advisable to join a like committee from our sister association, the Cattle Raisers' Association of Texas, and make a united effort to accomplish the work assigned it. We approved the suggestion, and directed the lease committee to act accordingly.

"We submit the following recommendations:

"First. We recommend that this Convention consider the advisability of creating a number of standing committees, to whom may be referred many of the special questions affecting our interests, and whose solution would prove of value to our membership.

"Second. We recommend that the association so change its laws that some one city in Texas may be selected as its permanent home.

"Third. We further recommend that the annual dues hereafter be fixed at five dollars, and that the membership fee be abolished."

The committee appointed to recommend officers for the current year reported in favor of Ike J. Pryor, of Columbus, for President; N. Sanson, of Alvarado, Vice-President; George B. Loving, of Fort Worth, Secretary and Treasurer, and V. P. Brown, of San Antonio, Assistant Secretary; and to compose the Executive Committee the following names were recommended: N. T. Wilson, San Antonio; S. B. Moore, Flatonia; A. S. Reed, Fort Worth; J. B. Baker, Houston; J. M. Daugherty, Abilene.

Another organization which has done excellent work in a very unassuming manner is the Southeastern Texas Cattle Raisers' Protective Association. Of this organization Mr. W. J. Moore, of Galveston, is President; Mr. John Warren, of Hockley, Vice-President; Mr. F. A. Helbig, of Houston, Secretary, and Mr. J. Willeford, Treasurer. This is a comparatively young association which has just got thoroughly into working order, and is now in the second year of its work. It was established for the purpose of mutual protection of those interested in the cattle business in the Southeastern counties of Texas, to put a stop to depredations which were formerly so frequent, and to prosecute offenders when caught. The immense area over which the industry has spread makes it impossible to repress crime except by a very general organized effort. The association also takes cognizance of all matters of general interest to cattlemen, such as the best kind of grass to grow, the grades of cattle which yield most profit to raisers, the securing of reasonable freight rates and the enactment of laws to meet injustices as they arise.

The association started on a very modest scale with some twenty members. At the present time its membership is very much larger, and all the immense territory covered by its title is carefully watched. The Executive Committee consists of such well-known men as John W. Greer, Pattison; J. R. Fenn, Duke; S. E. Allen, Harrisburg; C. A. Menke, Hempstead, and H. B. English, Sealy. The Finance Committee consists of Messrs. George Pattison, Pattison; Ed. Weygand, Cypress; G. W. Davis, Webster; J. M. Frost, Houston, and J. O. Petty, Hempstead. The Hide and Skinning Committee, to which duties of great importance are assigned, is composed of the following: W. J. Magee, Houston; J. O. Petty, Hempstead; H. B. English, Sealy; J. Badke, Buckshire; G. W. Davis, Webster; J. R. Fenn, Duke; F. Hager, Jr., Hockley; P. Mischke, Westfield; N. Brookshire, Brookshire; C. A. Menke, Hempstead, and B. A. Kelly, Chenanga.

It is not suggested that all the associations of importance have been mentioned in this chapter. As stated upon an earlier page communications were addressed by the Editor to some officer of every association of which any tidings could be obtained. Where any reply was received the matter has been

taken up, but in a majority of instances references were given which did not yield results. The importance of consolidation in cattle raisers' associations has been thoroughly appreciated in recent years. It is the general opinion of all interested that the plan of establishing an organization in every township or range district is of doubtful benefit, with returns not up to the expectation of those responsible for the work. A perusal of the preceding chapters will have given some idea of the good done by the larger organizations and of the influence they have exerted from time to time upon the cattle industry.

Before concluding the subject, it seems only just to both author and readers, we mention the fact that while these papers have been in the press events of great importance to the cattle industry of Texas and the Southwest have transpired. Notably among these should be mentioned the great increase in the price of meat to retailers. So marked has been this advance during the spring of 1895 that a great deal has been heard of a possible famine in cattle and of dire results to follow. Some dissatisfaction has been caused among cattle raisers by the action of the United States Government in condemning what it has styled a combine to put up prices. As has always been the case when the price of meat has gone up, the cattlemen have not received their share of the benefit. In other words, while there has been a sensational increase in the price of meat, there has been nothing sensational in the increase in the marketable value of cattle on the hoof. Prices are very much better than they have been, and, as this history goes to press the prospects of renewed prosperity for the cattlemen of America are brighter than they have been for at least nine years. If prices for cattle had gone up during the last few weeks in the same proportions as the prices for meat, there would have been almost a repetition of the bonanza period of twelve and thirteen years ago, and even as it is, there is much cause for congratulation.

If a perusal of this history and of the events which have invariably resulted in a period of great depression following a period of activity and better prices, should lead to a steering clear of the errors into which it has been so easy but so disastrous to fall, the object of the writer and publishers will have been more than attained. There are certain laws to which all trades and professions are subject, and it is impossible to break any one of these laws without paying the inevitable penalty. In the cattle industry the error has generally been an absolute ignoring of the fact that supplies cannot for any length of time exceed demand without a rapid fall in prices. To what extent combinations, which have just kept within the letter of the law, are responsible for the periodical fall in prices for cattle in the past, this deponent sayeth not. A committee of the United States Senate solved the problem a few years ago to its own satisfaction. No particular result followed, however, and opinions are divided as to the wisdom of the appointment of the committee in the first place, and whether the good or the evil that it did has the more outlived it.

As stated in the introduction, both sides—in some cases, a great many sides—have been given prominence in the historical chapters. With a subject so broad, an interest so prodigious, and a difference of opinion so marked and conspicuous, this was the only possible course open to the writer. A comparison of the different opinions may not convince even the majority of the readers as to which is right and which is wrong, but it will at least show them what has been attempted in the past and the measure of success which has attended various efforts. It is a notorious fact that only the careful student of history can be even approximately successful as a statesman or a diplomatist. In our opinion it is only the cattleman who studies the history of the cattle industry, and thinks out for himself both cau seand effect, that can hope to rise above the level of mediocrity, and to continue prosperous in bad times as well as good.

THE COWBOYS' CHRISTMAS BALL.

BY

LARRY CHITTENDEN, POET RANCHMAN.

TO THE RANCHMEN OF TEXAS.

'WAY out in Western Texas, where the Clear Fork's waters flow,
Where the cattle are "a-browsin'," an' the Spanish ponies grow;
Where the Northers "come a-whistlin'" from beyond the Neutral strip;
And the prairie dogs are sneezin', as if they had "The Grip";
Where the coyotes come a-howlin' 'round the ranches after dark,
And the mocking-birds are singin' to the lovely "medder lark";
Where the 'possum and the badger and rattlesnakes abound,
And the monstrous stars are winkin' o'er a wilderness profound;
Where lonesome, tawny prairies melt into airy streams,
While the Double Mountains slumber, in heavenly kinds of dreams;
Where the antelope is grazin' and the lonely plovers call—
It was there that I attended "The Cowboys' Christmas Ball."

The town was Anson City, old Jones's county seat,
Where they raise Polled Angus cattle and waving whiskered wheat;
Where the air is soft and "bammy," an' dry an' full of health,
And the prairies is explodin' with agricultural wealth;
Where they print the *Texas Western*, that Hec. McCann supplies
With news and yarns and stories uv most amazin' size;
Where Frank Smith "pulls the badger" on knowin' tenderfeet,
And Democracy's triumphant, and mighty hard to beat;
Where lives that good old hunter, John Milsap, from Lamar,
Who "used to be the Sheriff, back East, in Paris, sah!"
'Twas there, I say, at Anson, with the lively "Widder Wall,"
That I went to that reception, "The Cowboys' Christmas Ball."

The boys had left the ranches and come to town in piles;
The ladies—"kinder scatterin'"—had gathered in for miles.
And yet the place was crowded, as I remember well,
'Twas got for the occasion at "The Morning Star Hotel."
The music was a fiddle an' a lively tambourine,
And a "viol come imported" by the stage from Abilene.
The room was togged out gorgeous—with mistletoe and shawls,
And candles flickered frescoes around the airy walls.
The "wimmin folks" looked lovely—the boys looked kinder treed,
Till their leader commenced yellin': "Whoa! fellers, let's stampede!"
And the music started sighin' an' a-wailin' through the hall,
As a kind of introduction to "The Cowboys' Christmas Ball."

The leader was a feller that came from Swenson's Ranch,
They called him "Windy Billy," from "Little Deadman's Branch."
His rig was "kinder keerless," big spurs and high-heeled boots;
He had a reputation that comes when "fellers shoots."
His voice was like a bugle upon the mountain's height;
His feet were animated, an' a *mighty, movin' sight.*
When he commenced to holler, "Neow, fellers, stake yer pen!
"Lock horns ter all them heifers, an' russle 'em like men.
"Saloot yer lovely critters; neow swing an' let 'em go,
"Climb the grapevine 'round 'em—all hands do-ce-do!
"You Mavericks, jine the round-up—Jest skip her waterfall!"
Huh! hit wuz gettin' happy, "The Cowboys' Christmas Ball!"

The boys were tolerable skittish, the ladies powerful neat,
That old bass viol's music *just got there with both feet!*
That wailin', frisky fiddle, I never shall forget;
And Windy kept a-singin'—I think I hear him yet—
"O Xes, chase your squirrels, an' cut 'em to one side,
"Spur Treadwell to the center, with Cross P Charley's bride;
"Doc. Hollis down the middle, an' twine the ladies' chain,
"Varn Andrews pen the fillies in big T Diamond's train.
"All pull yer freight together, neow swallow fork an' change,
"'Big Boston' lead the trail herd, through little Pitchfork's range.
"Purr 'round yer gentle pussies, neow rope 'em! Balance all!"
Huh! hit wuz gettin' active—"The Cowboys' Christmas Ball!"

The dust riz fast an' furious, we all just galloped 'round,
Till the scenery got so giddy that Z Bar Dick was downed.
We buckled to our partners, an' told 'em to hold on,
Then shook our hoofs like lightning until the early dawn.
Don't tell me 'bout cotillions or germans. No, sir 'ee!
That whirl at Anson City just takes the cake with me.
I'm sick of lazy shufflin's, of them I've had my fill;
Give me a frontier break-down, backed up by Windy Bill.
McAllister ain't nowhar! when Windy leads the show;
I've seen 'em both in harness, and so I sorter know—
Oh, Bill, I sha'n't forget yer, and I'll oftentimes recall
That lively gaited sworray—"The Cowboys' Christmas Ball!"

[From "RANCH VERSES," by permission of the Publishers. G. P. Putnam's Sons, 27 W. 23d street, N. Y.]

INDIAN DEPREDATIONS.

NOTE.—The following chapter on Indian Depredations was compiled largely from the many incidents which were related to the representatives who traveled through Texas gathering biographical sketches for this volume, while the works of Yoakum, Wilbarger, Ford and other Texas historians have been drawn upon for a more complete presentation of facts and details. It very appropriately follows the history of the Cattle Industry, and was prepared by Mr. S. D. Barnes, the editor of a majority of the biographies which appear in the subsequent pages.

LESS fortunate than the pioneers of other portions of the West, the early cattlemen of Texas were forced to contend not alone with the wild tribes which originally inhabited the lands they coveted, but from time to time their homes and herds were raided by the remnants of the warlike nations of the Eastern forests, held by the United States Government, under a pretense of restraint, on the borders of the Lone Star State. Historians agree that few depredations were committed by Indians upon the persons and property of the first American colonists introduced by Moses and Stephen Austin, under the Spanish and Mexican *regimes*, while practically the last raids made upon Texan soil were by bands from the reservations north of the Red River. With a foe that they could follow and chastise in his own retreat the Texan cattlemen knew how to deal; but they were powerless when annoyed by bands that could evade pursuit and find safety amid the peaceful (?) surroundings of a Government Agency. The Texas Indians were practically disposed of at an early day, but in the Northwestern counties, within striking distance of the Indian Territory, depredations were of frequent occurrence until late in the '70s.

As far back as 1690, missions had been established by the Franciscan monks, under the auspices of the Spanish Government, among the Indian tribes of Eastern Texas and at points along the Rio Grande, and during the next forty years others were founded near the Gulf Coast and as far in the interior as San Antonio. To the good offices of the Franciscan fathers, or, perhaps, to the prowess of the military forces by which each mission or presidio was guarded, may be attributed the immunity from danger experienced by the American settlers who afterward established themselves in the vicinity of the points mentioned. The Eastern Indians, the Aas, Adaes, Orquisacos and Nacogdoches, and other subdivisions of the great Caddo family, occasioned the early settlers but little trouble, while they were often of great assistance against marauding bands from the hostile tribes of the Western plains. The Caranchuas, who roamed on the gulf prairies and inhabited the islands between the mouths of the Brazos and Nueces Rivers, were more warlike than the Caddos, and were held in great dread by the Spaniards, who believed them to be cannibals, and consequently took good care to keep out of their clutches. Latterly, the tribe was nearly exterminated by the Lipans, and the few survivors confined themselves for safety to the islands along the coast, subsisting principally upon fish and oysters, and relinquishing the pursuit of game almost altogether.

The Lipans, a tribe of more consequence than either of those previously mentioned, always professed to be friendly to the whites, but this was merely a subterfuge to gain an ally against their common enemies, the Comanches. In reality they were ever ready to steal a horse or take the scalp of a white man if it could be done without danger of detection, but their professed friendship was preferable to open hostility, and, like the Caddos, the Lipans were often of service as trailers and scouts in expeditions against other tribes. As a distinct people, the Lipans have been extinct for many years. Their alliance with the whites was of no avail in the end, for, though it delayed, it could not avert their final doom.

Even the Comanches, whose hatred of the Spaniards and Mexicans dates back to the first Spanish occupancy of the country, were willing to extend the hand of friendship to the Americans during the

early days of colonization. An experience showing the existence of this friendly spirit occurred to Stephen Austin in 1822, when en route from San Antonio to the City of Mexico to conclude arrangements for his land grant. Incautiously building a fire one morning, against the advice of his guides, the smoke was observed by a band of fifty or more Comanches, and he was surrounded, captured and robbed of his entire belongings. With great presence of mind, Austin approached the chief of the party, declared himself an American, and reproached the Comanche for his act of treachery to a friend of his people. The plea proved effective, every missing article was restored, and Austin was allowed to pursue his journey in safety and peace. Eleven years after this event, in 1833, Mary Austin Holley, a resident of Texas, wrote of the Comanches as follows: "Though fierce in war they are civil in peace, and they are remarkable for their sense of justice. They call the people of the United States their friends, and give them protection, while they hate the Mexicans, and murder them without mercy." However, as early as the date last mentioned, the Comanches had began to view with jealousy and disfavor the increasing settlements in the midst of their hunting grounds, and their friendship for the Americans was soon lost in bitter and lasting hatred.

From a general knowledge of the Indian character it is safe to assume that there was always danger to be dreaded by the colonists, even when the tribes were avowedly friendly. An Indian who chanced to covet the horse or arms of a "white brother" would hardly hesitate at committing a murder to secure it, providing the risk of discovery and punishment was not too imminent. The first immigrants of the Austin Colony settled in Texas in the early part of 1821, and in the summer of 1823 the first murders by Indians of which we have a record occurred. The Caranchuas (or "Cronks," as the old Texans invariably called them) were the guilty parties in this instance. Three young men, Loy, Alley and Clark, had been down the Colorado River in a canoe to purchase corn, and the Caranchuas, who were encamped at the mouth of Skull Creek, fired upon them as they returned, killing Loy and Alley, and wounding Clark in seven places. The latter escaped by swimming to the opposite bank and managed to reach the settlement. That same evening the Caranchuas fired upon another colonist, a Mr. Brotherton, but he eluded them by dismounting and hiding in the bushes, though his horse and gun fell into their hands. A party of fourteen whites was immediately gotten together, and at daybreak the following morning they surprised the Indians in their camp, killing nineteen out of the band of twenty-one warriors. In 1824 other murders were committed by the Caranchuas, the victims being emigrants, passing from the mouth of the Brazos to the settlements on the Colorado, and Captain Randall Jones, with a company of twenty-three men, was ordered to visit the Caranchuas' camps on the Brazos, and to attack them if they exhibited signs of hostility. As he passed down the river in boats, several small parties of Indians visited him, but professed friendship, and he learned from them that about thirty of the tribe were encamped near at hand, and that ten or twelve more had gone to the settlements to purchase ammunition. Captain Jones at once sent a message to the settlements for reinforcements and to notify the settlers of their danger, but the colonists had already taken the alarm, and his messengers arrived among them in good time to take part in an attack on the visiting redskins, in which several Caranchuas were killed and the others driven from the vicinity. Meanwhile Captain Jones had, by a good deal of trouble and risk, located the main camp of the Indians, and had approached it so closely that he heard the warwhoops and howlings that welcomed the return of the defeated party, bringing with them their dead and wounded. When the whites made their attack next morning they found themselves outmatched in numbers and position, the Indians taking shelter in the tall grass from which they could return their assailants' fire with very little risk to themselves. The whites were at last forced to retreat with a loss of three men killed, the Indians' loss being about fifteen. During the course of that same year the Caranchuas received another drubbing, and growing tired of warfare, they voluntarily proposed to make a treaty, and to their honor, be it said, they held strictly to its provisions as long as the tribe could claim existence as such.

It was also in 1824 that the Wacos killed Captain Tumlinson, who resided on the Colorado, near the present town of Columbus. He had started to San Antonio with a companion and was attacked close to where Seguin now stands. Newman, his companion, escaped, and upon carrying the news of the murder to the settlements he led a search for the body, but it was never recovered. Later on, Captain J. J. Tumlinson, a brother of the murdered man, led a party of eleven Texan youths against a

MAH-HA—A YOUNG COMANCHE

THE
JOHN CRERAR
LIBRARY

band of Wacos, encamped some fifteen miles from Columbus, and of the thirteen Indians twelve were killed before they could raise a hand in defense. Such was the punishment commonly meted out by the Texans to Indian murderers, and in a majority of cases it was prompt as well as effective.

One of the first encounters with the Comanches came about, in 1827, through a mistake in judgment of an over-suspicious Texan. A war party on its way down the Brazos to steal horses from the Lipans, stopped at the house of Captain Sims, in Burleson County, and asked him to give them a letter stating that they were "good Injuns" and had behaved as such so far as the writer knew. At Captain Sims' request, a Mr. Tate, who was living with him at the time, wrote the letter as directed, but added: "From all appearances I am induced to think these Indians are going down the Colorado to steal from the settlers." The Indians continued East, to the Brazos, where they showed their "letter of recommendation" to Colonel Ross, who, upon the strength of the postscript, collected a company of men at once, and attacked and killed the entire party with the exception of two, who escaped through the speed of their horses. These survivors returned to their people, and a war party was at once sent out to seek revenge for this act of treachery on the part of the whites. Going directly to Captain Sims' home, they laid in wait for the man, Tate, who they rightly judged had caused them all their trouble, and upon his appearance, all fired upon him at once, breaking an arm and one of his legs. The horse he was riding at the time carried him into the thick undergrowth of the river bottom, and he was not pursued; the Indians doubtless thinking his wounds must prove fatal. He recovered, however, and shortly afterward returned to the Eastern States. This was the wisest course he could have pursued, for the Indians never forget an enemy, and the losses they suffered through this man's act rankled in their memories for years.

The Wacos and Tehuacanas committed a good many minor depredations during the years 1828-'9, being especially troublesome on the lower Brazos and Colorado. Several murders in the vicinity of Gonzales convinced the whites of the necessity of doing something in the way of reprisal, and three companies of fifty men each were formed, and placed under the command of Colonel Abner Kuykendall. An attempt was made to surprise an Indian camp at the mouth of the San Saba, but the approach of the command was discovered and the camp was deserted before their arrival. The troops were out thirty-two days and suffered many privations, and only one Indian was killed. At about this period the Wacos came in conflict with the Cherokees, who had crossed the Red River from the Cherokee Nation and made a temporary lodgment in Texas. The Wacos stole their horses, and in revenge they attacked their village, located near where Waco now stands. A fierce battle followed, and while the Cherokees were the fewer in numbers, they were armed with rifles while the Wacos had only bows and arrows. The Tehuacanas reinforced the Wacos in time to prevent their total defeat and the Cherokees had to withdraw, losing three of their number, but carrying away the scalps of fifty-five of their enemy—this being just the number of Cherokees who were engaged in the battle. They cherished an enmity against the Tehuacanas for their interference on this occasion, and the following year 120 Cherokee braves attacked the principal village of the rival tribe, situated in what is now Limestone County, and literally swept the village and its inmates from the face of the earth. The Tehuacanas had built a rude stone fortress for their protection, and taking shelter within this, they resisted the first onslaught of their foes; but the Cherokees were not to be frustrated in this manner. Collecting dry grass, they thrust it, burning, through the openings in the walls, and many of the Indians within were suffocated, while the rest were slaughtered as they sought to reach the open air. This massacre freed the settlements on the Brazos from the annoyances the Tehuacanas had before inflicted upon them, and the signal victory won by the Cherokees over a force which must have been many times larger than their own speaks volumes for the superiority of the rifle as a weapon over the powerful bows and keen lances in the use of which the Southwestern Indians were so expert.

The possession of firearms, and a readiness to use them if occasion required, was the settler's only protection at the period of which we write. The Indians were quick to place a just estimate upon the propulsive force of gunpowder and the range of leaden pellets, and the bravest of them would shrink from facing a leveled weapon. Besides, they seemed to hold an exaggerated idea of the bravery of the whites, based upon occasional deeds of desperate heroism, reports of which had rapidly spread through the tribes. Of this description was the following incident, which occurred in 1830: Jesse Burnam, one of

Austin's original "Three Hundred," had located on the Colorado, in Fayette County, in a point so remote from other settlements that he could hardly hope for other protection than that afforded by his own hardihood and knowledge of Indian nature. On the occasion referred to, Burnam was suffering with a malarious fever which confined him to his bed, and was alone, the presence of his wife and little children excepted. His horses, of which he owned a good number, were grazing in a pasture near the house, and attracted the attention of a passing band of Indians, who leisurely let down the fence and drove them forth. One of the children witnessed the theft and reported it to Burnam, who, already half crazed with fever, determined to recover the jeopardized property at the risk of his life. One horse was left him, a fine saddle animal which he had tied, as usual, in the yard, and mounting this, with his double barreled shotgun across the saddle before him, he hastened on in pursuit of the thieves. After a long chase he came in sight of his horses, hurried along in front of a dozen jubilant warriors, and in his mad desperation he determined to attack the party at once and stampede the horses, believing that the frightened *caballada* would in that case scatter, and make their way back to their home. The first intimation that the Indians received of Burnam's presence was when he fired both barrels of his heavily loaded arm in their midst, and before they could recover from their consternation he had dashed through them, with loud yells, and right among the stolen horses. The effect of this demonstration on the latter was instantaneous. They had all along objected to leaving their rightful range, and it is possible that they recognized Burnam and his horse as part of what a Texan might call their own "outfit." But be that as it may, they followed the lead their owner set them, and were soon out of arrow shot. The Indians followed for some distance, but eventually gave up the chase in disgust, and Burnam carried his recovered *caballada* home in triumph without the loss of a single animal. The Indians could never understand how a single man could show so much hardihood under the circumstances, and it is probable that Burnam himself hardly appreciated what he had done until later on. Wilbarger, who mentions this incident in his work on "INDIAN DEPREDATIONS IN TEXAS," comments on the fevered and angered condition which prompted this terrible risk, and remarks: "We can understand this, as we have been very sick frequently as well as angry, and no doubt if we had been in Burnam's place we would have done some desperate charging too—but it would have been in the opposite direction from the Indians."

The home of Charles Cavina, on Caney Creek, in Matagorda County, was attacked by seventy Indians in 1830, his wife and three daughters killed and a fourth daughter wounded. Mrs. Flowers, the wife of a neighbor who was visiting at the house at the time, was killed, while a daughter who had accompanied her was wounded. The two girls who were yet alive were thrown in a brush heap, and left for dead, but both recovered and lived for many years. Cavina returned while the Indians were still in possession of his home, and made haste to give the alarm to the other settlers in the neighborhood. A company of sixty men was raised under the command of Captain Buckner, and they came up with the Indians camped beneath a bluff on the Colorado River, where the town of Matagorda is now situated. A Mr. Morrison, sent to spy out their position, approached too close to the verge of the bluff, and tumbled down in their midst, but managed to secure shelter in a cave, and fought off the enemy until his companions came to his relief, killing five Indians with his rifle and pistols. Hemmed in, with the river on one side, and the avenging Texans on all others, the redskins could only escape by swimming, and over forty of them were left dead on the battlefield or beneath the waters of the Colorado. Later in the year the presence of another band of Indians—Wacos and Keechis—was discovered by the settlers on Caney Creek, their camp was surrounded and a bloody fight followed, one Texan and four Indians being killed. Quite a number of depredations were committed on Little River at about this same time; and the following year a party of silver seekers, who started from San Antonio to the San Saba River, narrowly escaped extermination at the hands of the Tehuacanas, Wacos and Caddos.

This party was led by Rezin P. Bowie, one of the most noted fighters of his day, and his companions were his brother, James Bowie, James Coryell, Robert Armstrong, David Buchanan, Jesse Wallace, Matthew Doyle, Cephas Hamm, Tom McCaslin and two servants. The object of the expedition was to discover the old silver mines formerly worked by the Spanish founders of the San Saba mission. The country to be penetrated was counted among the most dangerous within the limits of Texas, and on the nineteenth day out from San Antonio they encountered two Comanches and a Mexican, belonging to a

party of sixteen under the leadership of Isaonie, a noted Comanche chief, who were camped some miles away. Presents were given the Indians and their companion, who then returned to their camp, but the next morning the Mexican rejoined Bowie's party, bringing from his chief tidings that the whites were followed by one hundred and twenty Tehuacanas and Wacos and forty Caddos, and would be attacked as soon as overtaken. Isaonie urged the whites to come to his camp, and promised the assistance of his own band in case a conflict with their pursuers could not be avoided. Bowie, however, concluded to proceed on his way, hoping to reach the old fort on the San Saba, some thirty miles away. Failing in this, he chose his camp in the midst of a cluster of live oaks, further protected by a dense thicket of some size, and surrounded by comparatively open country through which an enemy could not approach without a certainty of detection. They were undisturbed during the night, but as they were preparing to set out next morning, they discovered the Indians approaching on their trail. Rezin Bowie and Buchanan went out to have a peace talk with them, but were fired upon and the latter's leg broken. Bowie returned the fire, and, shouldering his helpless companion, started back to shelter, which he succeeded in reaching, though on the way Buchanan received two more wounds. Eight Indians rushed in on foot to intercept them, but were met by the whites, and four of their number killed. Firing then became general and several Indians fell, but the assailants were kept back at such a distance that their arrows did no damage. At length fifteen or twenty Caddos, the professed friends of the whites, secured lodgment under the bank of a stream, some forty yards in the rear of the Texans, and as they were armed with rifles, their fire was at once effective. Doyle was shot through the breast; McCaslin hastened to his side, and fell dead with a bullet in his body. The Caddos were at length driven from their point of vantage, and then the white men, concealed from view in the thicket, had a great advantage over the enemy who must necessarily approach them across the open ground. After two hours hot firing, during which Coryell was wounded in the arm and side, the Indians grew tired of this course of procedure, and attempted to dislodge the whites by setting fire to the dry grass around them. The first attempt was ineffectual, for they started the fire in the wrong quarter, and the wind carried it around the thicket leaving it untouched. Warned by this, Bowie directed his men to clear the dry grass and leaves from around the baggage and the wounded men, for fear that fire might be started in the little scope that still remained untouched, and it chanced this precaution was taken just in time. An Indian crept near and fired the grass the second time, but was killed by Armstrong before he could regain his party. It was a terrible moment for the besieged men, for a wall of fire ten feet high was approaching them, and a perfect shower of arrows and bullets were falling among them as they crouched in their slight shelter. If the Indians had charged under cover of the smoke the battle would have soon ended, but from some cause they failed to do this, and as the fire reached the green foliage of the thicket, it became less fierce and was smothered out with the blankets before it got to the wounded men or the baggage among which they lay. The thicket, however, had been so badly scorched that it was almost useless as a shelter, and the whites began throwing up a rude circular breastwork around their baggage, building it of dirt and loose rocks dug out with their hunting knives and sharpened sticks. At sundown the Indians withdrew from the fight, and camped some two or three hundred yards away; the next morning leaving the locality altogether, carrying their dead and wounded with them. The whites, however, continued work on their little fort, and made preparations to sustain a siege. Late in the day a party of thirteen Indians reconnoitered their position, but finding them still able and ready to fight, hastily took their departure, and they were seen no more. Bowie's party remained eight days in the shelter of their fortification, and finally made their way back to San Antonio, their loss in the fight being one man killed and three wounded. They estimated the loss of the Indians at forty-eight or fifty.

As settlements became more numerous in the country, conflicts with Indians naturally increased in frequency. The redskins had come to look upon the colonists as their worst foes, and at the same time regarded their herds as a certain source of support when game was scarce or they were too lazy to hunt for it. Their descents upon the settlements were principally to secure plunder, and they would appropriate anything that struck them as a novelty, regardless of its value to them or its owner. Horses were what they principally desired, and if they could manage to secure a scalp while stealing a pony, why, so much the better. The settlers, in their turn, accepted the situation with true American spirit,

and adopted the motto which General Sheridan is generally credited with putting in words: "There is no good Indians except dead ones." A redskin found in the vicinity of a settlement was usually compelled to give a good reason for his presence or pay the penalty of his rashness. With such a state of affairs in existence, encounters were of almost weekly occurrence.

In the summer of 1833, a party of five young men, Josiah Wilbarger, Christian, Strother, Standifer and Haynie, left Hornsby's place on the Colorado, nine miles below Austin, intending to make a general survey of the country for several miles to the Northwest. On Walnut Creek they sighted an Indian and gave chase, but he eluded them in the hills and they turned back, halting near Pecan Spring to eat a lunch. Wilbarger, Christian and Strother unsaddled and hobbled their horses, but the others, for some reason, did not follow their example. While they were eating they were surprised by a party of Indians. Strother was mortally wounded at the first fire, and shortly after Christian received a bullet which broke his thigh, while Wilbarger had a flesh wound in his neck and was pierced through both legs with arrows. They sustained the fight for a time, partially sheltered by some small trees, when, seeing that there was no chance for them, Standifer and Haynie mounted their horses for flight. Wilbarger begged to be taken with them and had left his tree in an attempt to reach them, when a bullet pierced his neck and he fell, apparently lifeless. The Indians crowded around the fallen men and scalped all three, cutting the throats of Strother and Christian, but omitted to do this in Wilbarger's case. After they had left he regained consciousness, and managed to crawl about six hundred yards from the scene of the fight, when his strength again failed him. He was found there the next day by a party sent out to recover the bodies of the slain, and, in spite of his terrible injuries, lived for eleven years afterward, eventually dying from a disease of the skull and brain resulting from the loss of his scalp. Other cases have been known wherein persons have been scalped and recovered, but Wilbarger's recovery was particularly notable since he sustained other wounds apparently sufficient in themselves to cause death.

What is known as the "Madden Massacre" also occurred in 1833. Quite a settlement had been formed in Houston County, and on the night when the Indian attack came, several of the families were collected in a double log house. Three or four men were in one of the rooms moulding bullets, and the women and children were in the other. The only light in either apartment was that afforded by the fires that were burning on the hearths. In some way the Indians discovered that the party were divided and took possession of the hall between the rooms, some of their number guarding the door through which the men must pass to reach the outside, while the rest murdered the women and children. Seven victims fell beneath the deadly blows of hatchets and knives. Mrs. Madden was wounded several times, and as she fell, accidentally rolled beneath a bed and one of her little sons crept after. A moment later, when the fire had been extinguished by the blood of one of the murdered women, Mrs. Madden and her son crept among the Indians in the darkness and made their escape. The men in the adjoining room were unarmed and made no attempt to go to the aid of their wives and children, but fled at the first opportunity—the most disgraceful exhibition of cowardice that has ever blotted the annals of frontier warfare.

Outrages similar to that described above now became so common that in the space of the present article they can only be mentioned in a general way. The settlements were pressing North along the principal rivers, mainly confining themselves to the timbered bottoms and the Cross Timber regions, and nearly all the depredations were committed by skulking bands, which took advantage of the cover thus afforded them, and were perpetually stealing horses and harrassing the colonists in every way possible. Judge Gabriel Martin, a prominent citizen, was attacked by the Pawnees while on a buffalo hunt, and was killed, with his negro servant, while a son who accompanied him was captured but was afterward recovered by a party of United States Dragoons. The McLellan family, who had removed from Robertson's Colony to what is now Williamson County, were attacked before they had unloaded their wagon, and robbed of everything they possessed. McLellan was away from the camp with a little son, hunting, when the attack occurred. His wife and the other children were stripped of their clothing and tied, but, while the Indians were pillaging the wagon, the mother managed to loosen the cords and, with her infant in her arms and followed by her little boy, slipped away unnoticed, and took refuge in the San Gabriel bottom. Luckily she escaped the search the Indians made for her, and they finally abandoned the quest and took their departure. McLellan, returning to his camp, found his wagon

robbed and his family gone, and thinking they had been carried into captivity, turned back to the settlements, making the entire distance on foot, a terrible journey for the little boy who accompanied him. Thus deserted, the mother and her two children remained in the neighborhood of the wagon, living, as best she could, on some shattered corn found in the dust where the horses were fed, and when, several days later, her husband returned with a party to take the trail of her supposed captors, she had become so crazed with privations and mental agony that she fled from her friends and had to be run down and captured like a wild beast.

The Comanches again showed the falsity of their pretended friendship, in 1835, by killing a Mr. Lyons, in Lavaca County, and carrying his little son into captivity. The boy was returned to his friends many years later. That year also witnessed the murder of the Kitchen family, in Fanning County, of Ridgeway, near the falls of the Brazos, and of Hibbens, on the Colorado, in De Witt's Colony. The latter was just returning home with his wife and family who had been on a visit in the East. The family was attacked when just on the threshold of safety, Hibbens and his wife's mother killed, and Mrs. Hibbens and her two children lashed to a horse and forced to accompany the Indians. The youngest child, an infant, annoyed the Indians by crying, and was taken from its mother and killed. The other, being old enough to respect its mother's admonitions to silence, was spared, but mother and child were closely guarded until several days after the capture, when the Indians had crossed the Colorado and believed themselves beyond reach of pursuit. At last, one night, when her captors and the child slept, Mrs. Hibbens saw her opportunity to escape, and gently arose and slipped away in the darkness. She attempted to conceal her trail by wading down a running stream, but its windings confused her, and when she thought herself far away from the camp, she was apprised of its nearness by hearing her child piteously calling her. It was the most trying position in which a mother could be placed, but the safety of her child as well as herself depended on her reaching the settlement and giving the alarm, and she turned resolutely away, and late the next day found shelter and safety at the house of a settler. Colonel Tumlinson, with a company of rangers, chanced to be in the neighborhood, and he at once went in pursuit of the marauders, killed two of them and captured all their horses, arms and camp equipage, and also recovered Mrs. Hibbens' child.

RANCHMAN AND THOROUGHBRED PONY.

The trouble which was then brewing between the colonists and the Mexican Government attracted the attention of the authorities to such an extent that many Indian atrocities were allowed to pass without prompt punishment. Still, several organized companies of men were in the field to protect the settlements, and when they struck the trail of an Indian band they were tireless in the pursuit and unrelenting when the chase came to an end. A score of murders were committed in the district between the Brazos and Colorado Rivers, in 1836, and though the immediate perpetrators of the crimes were not always punished, it is believed that for each white man's scalp taken a half dozen Indians yielded up their lives. A complete and exhaustive history of the border warfare of that period can never be written. The green prairies of Texas had become the theatre of a drama upon which the eyes of nations rested with interest, and, compared with the wholesale butcheries of the Alamo and Goliad,

the atrocities committed by the Indians upon the defenseless families of the outlying settlements were of little importance, while such an event as the killing of a few Indians was hardly worth relating as a matter of news. Inured before to the continual presence of danger, the Texans had been transformed by the stirring scenes of their war for Independence into a veritable nation of soldiers, and, when freed from the oppressive yoke of the Mexican Government, they devoted their energies toward clearing their territory of hostile redskins. The McCullochs and Rosses, men who later distinguished themselves as Indian fighters and leaders in border warfare, were not then residents of the Republic, but there were others as brave, and as noted in their day, and as relentless in their hatred of Indians. But Texas was too great in expanse of territory, and her borders too extended, to admit of being thoroughly patrolled by a few small bands of rangers, however tireless, and the men who were in the field were kept continually moving, and in receipt of tidings of fresh depredations before they had overtaken and punished the perpetrators of the last. On one occasion a party of fifteen rangers, led by Captain Erath, attacked one hundred well-armed Indians from the north of Red River, who had penetrated as far South as Elm Creek, in Milam County, and though he was forced to leave the field through the fears of some of his men, who overrated the "staying qualities" of their opponents, the Indians had tried the temper of the Texans to their satisfaction and turned back northward with all speed as soon as the field was clear. Erath lost two men, the Indians, at least ten. Other encounters of a similar nature, preceding and following the one just mentioned, showed quite conclusively what the rangers could accomplish if occasion offered, but they were always pursuing an unwilling enemy who dared not make a stand in open ground, but confined themselves to assassinating helpless women and children, or waylaying an unarmed man as he tended his herds or cultivated the crops which was his family's only means of subsistence. Unfortunately, too, the term of enlistment of nearly all the rangers expired in 1836-'7, and through some negligence no others were enrolled until the expiration of President Houston's term in 1838. During this period the frontier settlements were, in many cases, abandoned, and not a family remained on the Little River or at the falls of the Brazos.

The Parker Fort massacre, in 1836, has been given an unusual degree of prominence in all published works on Texas, partly because of the number of people who were killed or wounded at that place, but principally on account of the romance attached to the after-life of one of the actors in this frontier tragedy. Parker's Fort had been constructed by a colony of Illinoians on the Navasota, its site being near the present town of Groesbeck, in Limestone County. It consisted of a stockade about fifteen feet high, of split cedar timbers, set deep in the ground and fastened together by other timbers at the tops. Two log cabins at diagonal corners constituted part of the enclosure while they added to its strength. The cabins were built with projecting upper stories in true block-house fashion, and were provided with port holes commanding every approach. There were also port holes in the stockade at convenient intervals. Everything had been done to make this little fort practically impregnable, for, as Fort Houston, in Anderson County, was the nearest military post, the Parker colony had to depend principally upon themselves for protection. The colony, at the time of the Indian attack, consisted of thirty-four persons, comprising the families of John, James and Silas Parker, L. M. S. Plummer, L. D. Nixon, S. Frost and G. E. Dwight and Benjamin Parker, unmarried, Mrs. Nixon, Sr., Mrs. Elizabeth Kellogg and Mrs. Duty. Old man Lunn, David and Evan Faulkenberry, Silas Bates and Abram Anglin, had built themselves homes a mile or so from the fort, but were not among its defenders on the fatal day.

On the morning of the nineteenth of May, James Parker, Nixon and Plummer started at an early hour to their fields on the river about a mile away, and they had scarcely gotten out of sight when several hundred Comanches and Kiowas appeared near the fort and signaled their desire to hold a talk with its inmates. Benjamin Parker went forth to meet them and was told that they were friendly to the whites, but that they wished to encamp in the neighborhood and must ask their kind friends to furnish them with a beef as they were very hungry. Parker returned to the fort and told the others that he believed the Indians intended to fight, but that he would talk with them further and try to avoid trouble if possible. Against the entreaties of his friends Benjamin Parker once more ventured forth and was immediately surrounded and killed. The Indians then charged upon the fort before its defenders could close the entrance against them. Wilbarger, in writing of this massacre, says: "The sickening and

bloody tragedy was soon enacted. Brave Silas M. Parker fell outside the fort while he was gallantly fighting to save Mrs. Plummer. Mrs. Plummer made a desperate resistance, but was soon overpowered, knocked down with a hoe and made captive. Samuel M. Frost and his son Robert met their fate while heroically defending the women and children inside the stockade. Old Granny Parker was stabbed and left for dead. Elder John Parker (the leader of the colony), with his wife and Mrs. Kellogg, attempted to make their escape, and in the effort had gone about three-fourths of a mile when they were overtaken and driven back near the fort, where the old gentleman was stripped, murdered, scalped and horribly mutilated. Mrs. Parker was stripped, speared and left for dead. Mrs. Kellogg was spared as a captive." Those killed, as we have seen, were John, Silas and Benjamin Parker, and Samuel and Robert Frost. Mrs. John Parker, Old Granny Parker and Mrs. Duty were seriously wounded, while those captured were Mrs. Plummer and her two-year-old son, Mrs. Kellogg, and Cynthia Ann and John Parker, aged nine and six years respectively. Early in the fight Mrs. Nixon made her escape and alarmed the men in the field, and Plummer at once made haste to summons Faulkenberry and the other neighbors, while James Parker and Nixon started to the fort hoping that they might be of some assistance. On the way Parker met his family escaping and hurried them off to a place of safety. A little further on Nixon met Mrs. Silas Parker with her four children, but at that juncture a party of Indians came up and made them all captives. The oldest children, Cynthia Ann and John, were taken up behind two of the mounted warriors, while Nixon, Mrs. Parker and her remaining children were forced back toward the fort. They were about to kill Nixon, when the appearance of Faulkenberry with his rifle caused them to fall back. The latter faced the Indians with his leveled weapon, holding them in check while Mrs. Parker retreated across a strip of prairie to the nearest woods, but just as this was reached the Indians made a charge which would have accomplished its object if other aid had not reached the fugitives. Bates, Anglin and Evan Faulkenberry, armed, and Plummer, unarmed, arrived at that moment and the Indians withdrew.

After the fort was vacated by the Indians, old Granny Parker, wounded as she was, crawled to Faulkenberry's house, where she was found that night, and after six days of terrible privations and sufferings, the entire party of survivors reached Fort Houston. The adventures of the captives would fill a volume. Mrs. Kellogg was transferred by her original captors to the Keechis, and by them to a party of Delawares, who delivered her to General Houston, some months after the tragedy, receiving one hundred and fifty dollars, the price they had paid the Keechis for her. Mrs. Plummer remained a captive about eighteen months, subjected to every indignity savage minds could devise. A child was born to her in October, some five months after the date of her captivity, but when it was about six months old her cruel masters decided that the care of the infant interfered too much with her other work, and it was taken from her and killed. The account of this horrible occurrence, given in Mrs. Plummer's own words, is in itself sufficient excuse for the relentless spirit so often exhibited by the Texans in their combats with red foemen. The child was strangled until apparently dead, and then repeatedly thrown in the air and allowed to fall on the hard ground. It was then given back to its agonized mother, under whose tender care it began to show signs of returning life. Then the Indians again tore it from her arms, tied a rope about its neck, and drew it back and forth through a cactus bed, tearing its flesh from its limbs. Finally, one of the Indians mounted a horse, tied the rope to his saddle, and galloped in a circle until wearied of the infernal sport, when the child's remains was once more given to the mother, and by her consigned to a rude grave. Mrs. Plummer was eventually ransomed by a trader who found her in an Indian camp, several hundred miles north of Santa Fe, New Mexico, and was returned to her family in Texas. John Parker grew up a veritable young Comanche, and accompanied the tribe on many raids. His return to the ways of civilization came about through the agency of a Mexican girl captured on one of the Comanches' marauding excursions. John took a great fancy to her, and his love was returned. On the way back to the Comanche village in the North, young Parker was prostrated by an attack of the small pox, and abandoned by his companions, who, as a special favor, left the Mexican girl to care for him, expecting, of course, that both would succumb to the fatal disorder, or, escaping that, perish of hunger in the wilderness where they were left. However, thanks to his sweetheart's nursing, John lived, and was induced by her pleadings to abandon the tribe, and settle down to a life of peace and happiness in a straw-thatched, mud-floored jacal by the Rio Grande.

Transformed from a warrior to a cowman, John became noted for his daring in the border conflicts, and at the outbreak of the war took sides with the Confederacy, and distinguished himself in many engagements. His sister, Cynthia Ann, spent half a lifetime with the Comanches, married the most renowned war chief of the tribe, and became the mother of a noted chieftain who still lives. Further mention of her will be made in its proper place later on.

The Parker Fort affair has been mentioned at length, because it was the first prominent instance in which the Texas settlers were made to feel the irresistible power of the allied Kiowas and Comanches, tribes which, later on, became the most troublesome and unrelenting of their foes, fighting every inch of the way as they were pressed back, northward and westward, from the grassy plains which are now the principal grazing grounds of the Lone Star State. Heretofore, the whites had only contended with the weaker tribes of the East; Indians like the Wacos, Caranchuas and others, who were usually encountered in small bands only, poorly armed, and as often on foot as mounted; while the Comanches and Kiowas counted their warriors by the thousands, were the most expert horsemen of all the aboriginal tribes, and were in many instances as well armed as the Texans themselves. The Comanches, too, had been for many years in a state of perpetual warfare with the Mexicans, and invariably the victors in encounters of importance, and consequently they possessed the assurance won by success, and held the Texans in contempt. How dearly they paid for this overestimation of their own prowess may be learned by a visit to their present reservation in the Indian Territory, and an enumeration of their diminished numbers. With the sole exception of the Apaches, the Comanches and Kiowas were the last of the Southwestern tribes to accept peace on the terms granted them by their white foemen. They will probably be the last to abandon their wild ways of life, and consent to a dissolution of the old tribal relations.

Following the establishment of Texan independence, settlements began to increase in number along the northern border. Emigrants from the Northern States, entering the Republic by way of Arkansas and Northern Louisiana, naturally turned westward to reach the prairie regions by the shortest route, and established themselves in Red River, Lamar and Grayson Counties. For a time they were undisturbed by the savages, but, in the meanwhile, depredations in the counties farther south were occurring more frequently than ever. Especially was this the case in the neighborhood of Austin, in spite of the numerous efforts at reprisal made by the organized frontier guards. In 1837 a party of eighteen Texans, under Lieutenant Vanthuysen, was surrounded by one hundred and fifty Wacos, Caddos and Keechis, and all but eight of their number killed. Sixty of the Indians were slain, and when the surviving whites charged through the savage ranks and left the field, their foes allowed them to go unfollowed. They had tested their courage and prowess to their satisfaction, and, with genuine Indian prudence, forbore from pressing the advantage gained. The power of the minor tribes above mentioned was already so thoroughly broken that they were forced to combine their strength in offensive demonstrations against the whites, but it seemed that when one enemy had been disposed of by the Texans, another and a more powerful one would spring up to annoy them. The Cherokees and their associated tribes, twelve in number—the Shawnees, Seminoles, Delawares, Kickapoos and others—had located themselves in Eastern Texas early in the '20s, and had taken up farming and stock raising to some extent, but were still only partially civilized. These tribes were suspected of sympathizing with the Mexicans during the period of the Texan revolution, but a close watch was kept on their movements, and they were not detected in any depredations of consequence until the autumn of 1837. A number of white settlers had located in the Cherokee country, and had planted and cultivated their crops, but growing fearful of danger, had sought refuge at Nacogdoches. Later several of the families ventured back to gather their ripened corn, but found the fences thrown down, and the greater part of the crop destroyed. With a reckless disregard of safety they remained to gather the remnant, and were attacked by the Indians, ten persons killed, and six taken captive. Of the Wood and Killough families, not a single person escaped. When this occurrence became known, two companies of soldiers were sent to guard the Neches and Sabine Rivers, and keep watch of the Cherokees, not allowing them to communicate in any way with the prairie Indians and Mexicans. Bowles, the Cherokee chief, resented this interference with his privileges bitterly, and notified Major Walters, who commanded the soldiers, to keep without the borders of the Cherokee country. Of course, such a state of affairs could not long

exist. Governor Houston, who had lived with the Cherokees for several years before coming to Texas, was suspected of delaying a proposed movement looking towards their dislodgment from the lands they then occupied, but even his forbearance was at last exhausted by the defiant position Bowles had taken, and he ordered General Rusk to move against him with the militia forces of the Republic. Many of the Mexican settlers on the Angelina and Nacogdoches, joined the Cherokees, and their leaders wrote Houston, disclaiming allegiance to the Texan government. In October, 1838, an engagement took place at Kickapoo Town on the Trinity River in Anderson County, with a mixed force of Mexicans and Indians, and they were dispersed with a loss of eleven killed. When Governor Lamar took his seat in December of that year, he attempted to bring about a peaceable removal of the Cherokees, or to gain some assurance from them of better behavior in the future, but failing in this, placed all his available force in the field under the leadership of such men as Burleson, Burnett, Landrum, Rusk, and Albert Sidney Johnson, the command being given to General G. K. Douglass. On the 15th of July, 1839, the allied tribes and their Mexican friends, eight hundred in number, were attacked by five hundred Texans on grounds of their own choosing on the Neches River, and, after a fight of an hour and a half, were driven from the field in confusion. The chief, Bowles, and a hundred of his men were killed and wounded. On the Texans' side five men were slain while twenty-seven received wounds, among others D. G. Burnett, the Vice-President of the Republic; McLoud, the Adjutant-General; and Johnston, the Secretary of War. No ordinary latter day office holders these, but men in the truest acceptance of the term. They had helped to create the Government, under which they held honored positions, and felt it their duty to offer their lives freely in its defense. The Cherokees, under the leadership of John Bowles and an Indian named Egg, established themselves for a few months on the head waters of the Trinity, and in the fall of 1839 attempted to lead their followers to Mexico, passing north of the settlements. Near the mouth of the San Saba River, they encountered Colonel Burleson and his command, who were on a scout after some of the prairie Indians, and in the fight which followed, both of the Cherokee chiefs were killed, with several of their followers, twenty-seven women and children were captured, and the remainder of the tribe sought safety among their kindred in the Indian Territory. Thus, through prompt and decisive measures, the Cherokee trouble was stamped out within two years of the first trouble with the tribe; and the Texans thus relieved from the presence of a dangerous enemy in their very midst, were allowed an opportunity to turn their attention to the foes that were pressing in upon them from the Western and Northern borders.

Meanwhile, the Comanches had thrown aside the mask of friendship and were committing more depredations than all the other wild tribes conjoined. Their numbers were so great that it was impossible to keep the different bands under surveillance, and consequently they could threaten the entire stretch of border at one and the same time. They seemed ubiquitous, and during the years 1838 and 1839, no inhabitant of the outlying settlements could retire at night with assurance that his slumbers would not be disturbed by the startling clamor of their warwhoops. The pioneer families in Grayson, Fannin and other Northern counties, suffered so severely from their constant raids that they abandoned their settlements and sought safety farther East. Numberless murders were committed in the counties of Nueces, Lavaca, Goliad, De Witt and Bastrop, and exploring and surveying parties venturing to inspect the fertile prairies of Limestone and Navarro, were attacked and forced to withdraw, though not without hard fought battles marked by heavy losses on either side. The most noteworthy massacre of these two years was that which occurred on the night of the first of January, 1839, at the Morgan and Marlin settlement near the falls of the Brazos. The home of George Morgan, on what is now known as Morgan's Point, several miles above the present town of Marlin, was at that time the most Northern point on the Brazos occupied by white settlers, though for a distance of twenty miles along the lower course of the stream settlements were fairly numerous. On the night in question, a portion of the families of James Marlin, Mrs. Jones and Jackson Morgan were visiting George Morgan and his family, and a little after dark the Indians rushed in upon them without a moment's warning. George Morgan and wife, Jackson Jones their grandson, Mrs. Jackson Morgan and Miss Adeline Marlin were immediately tomahawked and scalped, and Miss Stacy Ann Marlin was also severely wounded and the Indians supposed her dead, but for some reason did not take her scalp. Three children who were in the yard

when the Indians made their appearance, managed, in the confusion, to escape. One of them, Wesley Jones, first ran in the house in the midst of the scene of bloodshed, but immediately ran out again, and followed by Mary Marlin, a little girl, started for the house of John Marlin seven miles down the river, but did not reach it until after daylight the next morning. Isaac Marlin, a boy of ten years, secreted himself until the Indians had robbed the house and taken their departure, when he entered and felt the stilled pulses of his relatives and friends one by one to ascertain if any of them by chance survived. Miss Marlin was conscious but feigned death, and in the darkness mistook her brother for one of the murderers, while he also failed to discover that she still lived. He made all haste to convey the news of the tragedy to the nearest neighbor, reaching John Morgan's house hours before the other children; and the next day about noon Miss Marlin, though sorely wounded, managed to make her way to the same haven of refuge. As the news of the massacre spread, many came from the lower settlements to assist in burying the dead, but for several days no attempt to follow and punish the murderers was made. On the tenth of January seventy Indians attacked the house of John Morgan, but were beaten off with the loss of seven of their number. Then forty-eight of the settlers assembled, and after discussion, decided that their own safety required the adoption of something more vigorous than a mere defensive policy. Under the leadership of Benjamin Bryant, of Bryant Station, they took the trail of the Indians, and on the second day overtook them near Morgan's Point. The notorious chief, Jose Maria, who led the band, showed no inclination to evade the fight, but leisurely removed his gauntlets and fired the first shot, cutting the sleeve of one of the Texans. A general fight followed in which the Texans at first had the advantage, but growing over-confident of victory, they became careless, and taking advantage of this the Comanche chief suddenly led his warriors to the attack, driving the whites back in confusion. Ten of the Texans were killed and five wounded, and the Indians suffered a loss fully as great, but they were victorious, and were afterward more troublesome than ever, until, some months later, they met with a crushing defeat. It may be mentioned here, however, that the old chief, Jose Maria, eventually became one of the most peaceful and friendly of the Indians on the Government Reservation, and on a subsequent visit to Bryant Station enjoyed the pleasure of a "council smoke" with the leader of the Texans in the above-described fight, gravely accepting the honor of the first puff, this being his due as the victor.

On the twenty-seventh of May, 1839, Captain John Bird, at the head of thirty-one rangers, left Fort Milam, on the Brazos, and crossed to Fort Griffin, on Little River, where he was told of the presence of Indians in the vicinity and at once proceeded in pursuit of them. Shortly afterward they came upon twenty-seven Comanches who were skinning buffaloes. They scattered before the Texans' charge but afterward assembled and made a short stand and again fled, hotly pursued by the rangers. Finally, giving up the pursuit, they started back, but at Bird's Creek, seven miles northeast of the site of Belton, they were ambushed and surrounded by about forty Indians who poured in a deadly shower of arrows. The rangers managed to reach a ravine in which there was a spring, and here they made a stand, while the Indians took possession of a hill top about three hundred yards away and sent up "signal smokes," which were replied to from three different directions, and in a short time three hundred warriors were assembled under the leadership of Buffalo Hump, one of the most noted war chiefs of the Comanches. They approached the ravine in force, and halted a short distance away, that the Texans might see and be impressed with their strength. This movement failed of its object, for the rangers knew that the only course open for them was to fight as long as a man was left, and though, perhaps, despairing of meeting the savage horde successfully, they faced the inevitable with a cool bravery that nothing could daunt. Twice the Indians charged, and both times were driven back with heavy loss, the slopes of the ravine becoming dotted with their dead. Before making a third attack they retreated out of rifle range, and dividing their force, once more rushed in, charging from two sides at once. This was repeated again and again, but each time the steady fire of the rangers checked the charge. All this time the arrows had hailed around and among the gallant group by the spring. Captain Bird fell dead early in the fight, and six of his followers were dead or so badly wounded as to be of no further assistance to their comrades. The rangers had made one of the bravest fights in the history of border warfare, but were still outnumbered ten to one, and the steady strain upon their nerves

was having its effect. At this juncture, James Robinnett, one of their number, took the lead and cheered the men to continue the struggle. He told them that victory so far was with them. They had resisted the first rushes of the Indians when flushed with a consciousness of their superior force and assured of an easy triumph, and that if the long struggle had wearied them it must naturally have wearied their enemies still more, since they were continually in motion and had met discouragement at every turn. If the Texans could pick off some of the leading Indians the day would certainly be theirs, and Robinnett took an oath to kill the chief in the next charge at the risk of his own life. The charge came and he redeemed his vow. At the report of Robinnett's rifle, Buffalo Hump threw up his hands with a yell and fell from his horse, his immense head dress of buffalo horns rattling in the dust. His warriors bore the body from the field, and though they returned once more to the charge it was in a half-hearted manner and were easily repulsed. Under cover of the ensuing night they withdrew, and the next morning the surviving rangers made their way to Fort Griffin. Five of their number were killed, and they estimated the Indian loss at not less than one hundred.

This defeat was a hard blow to the Comanches, and they had received another drubbing earlier in the year at the hands of an allied party of Texans and Lipans. The Comanches were in winter quarters on the San Saba, and were discovered by their old enemies, the Lipans, who immediately carried the intelligence to the settlements. A party of sixty whites, led by Colonel John H. Moore, at once started for the camp of the "hostiles," accompanied by forty or fifty Lipans, but found that other bands had joined the first one at the winter quarters, and that they would have many times their own number to contend with. An attack was made at dawn, Castro, the Lipan chief, being commissioned, with a portion of his warriors, to run off the Comanches' horses, while Moore and the remainder of the party charged upon the camp. The surprise was complete, and if the attacking force had been a little larger it would have achieved a signal victory. After the first flurry the Comanches rallied and drove the whites from the camp, but they took a position in a ravine and continued the fight through the day. Castro and his assistant "horse thieves" proved too greedy to accomplish the work given them, for they attempted to get away with the whole drove of several thousand head, and were consequently so delayed that the Comanches came up with them and recovered the greater part of their property. Consequently, Colonel Moore returned with his purpose only partially accomplished, but he had taught the Indians a lesson which they were slow to forget.

Almost coincidental with the fight above mentioned, another party of Indians attacked a settlement on the Colorado, killing a Mrs. Coleman and her son, a lad of fifteen years. The story of this tragedy is of interest, since it shows the manner in which even the children of the pioneers could conduct themselves in the face of dangers calculated to appall the bravest of men. The Coleman family, with a neighbor named Rogers, were a short distance from the house when the attack was made, and Coleman and Rogers escaped to a thicket in the Colorado bottoms. Mrs. Coleman and her four children ran toward the house, but the youngest boy, Tommie, who was only five years old, was easily overtaken and captured. Mrs. Coleman reaching the door, turned to assure herself that all were saved, but was pierced through the throat with an arrow and soon expired. With her last breath she directed her son to get the guns and defend his sisters, and he discharged his duty nobly. The simple words in which Wilbarger relates the continuance of the struggle are as follows: "Young Albert fought with heroic bravery for a while, killing and wounding some three or four of the enemy; but finally he received a wound which in a very short time proved fatal, and he breathed his last with his head pillowed in the lap of his oldest sister, the last words he uttered being: 'Sister, I can't do any more for you. Farewell.' This left his two little sisters to take care of themselves as best they could. The little girls, who had taken refuge under the bed, kept up a conversation with each other, as they had been told to do, which doubtless deterred the Indians from entering the house, thereby saving their lives and the house from being plundered." Regarding the tragedy from the practical standpoint of one who was reared in the midst of such incidents, Wilbarger sees nothing worthy of especial comment in this instance of boyish heroism, nor in the spectacle of two timid girls cowering by the murdered bodies of their mother and brother, and forcing themselves to carry on an apparently unconcerned conversation that the Indians without might be deceived into thinking that the cabin still possessed defenders. By

noon of that day fifty-two men had collected and were in pursuit of the murderers, and twenty-two hours later they overhauled them on Brushy Creek, in Williamson County, and in the first fight which followed, Captain Burleson, one of the leaders of the Texans, was killed and the entire party retreated. Later they were re-enforced by General Ed. Burleson and thirty-two men, and returned to the attack. They found the Indians occupying a strong position on a ridge, but dividing their force, took stands on either side where their rifles could do effective work. Several ineffectual attempts were made to dislodge the Indians, but the Texans suffered so severely in these efforts that they abandoned them at length and contented themselves with keeping the enemy under a constant and deadly fire. Following their usual custom, the Indians withdrew under the cover of darkness, their mournful wailing as they left the field telling that their losses were heavy and probably included some of their most noted warriors. The whites lost four men killed in both engagements.

In their different engagements with the Comanches the Texans had taken many prisoners, while the Indians were known to have a number of white women and children in captivity. An exchange of prisoners was proposed and agreed to, and was arranged to take place at San Antonio in March, 1840. The transfer was to include all the prisoners held by either side, but when, on the 19th of March, the parties met as agreed, only one captive was produced by the Comanches, a Miss Matilda Lockhart, who had been captured in DeWitt County in 1838. Sixty-five Comanches, including twelve of the leading chiefs of the tribe and a number of women and children, met the peace commissioners at San Antonio, and when they were asked to produce their other prisoners, the head chief, Mukwarrah, persisted that they had but one, Miss Lockhart, and that the others were held by different tribes over which the Comanches had no control. Miss Lockhart denounced this as a falsehood, for she had seen several other prisoners in their camp a few days before, and knew that they intended holding them for ransom. A company of soldiers, under the command of Captain Howard, were ordered into the council room, and the interpreter was told to inform the chiefs that they would be held as hostages until the other captives were brought in. A fight immediately followed, in which the twelve chiefs were killed, but not before they had wounded Captain Howard and killed Judge Hood and several others.

Meanwhile the Indians on the outside of the building had taken the alarm, and attacked the guard with savage energy, even the squaws taking an active part in the encounter. Lieutenant Dunnington was shot through with an arrow, by a squaw, and instantly killed. Judge Thompson was shot and killed before he had received a warning of his danger. Some of the Indians took shelter in a stone house where they defended themselves for a time, but were all killed by the steady fire of the soldiers, the last one being forced to leave the building by throwing a burning turpentine ball down upon him from the roof. Others escaped across San Antonio River, but were pursued and all slain, except a renegade Mexican who managed to give the excited soldiers the slip. Altogether, thirty-two warriors were slain, together with three squaws and two children, while twenty-seven women and children were made prisoners. Later, one of the squaws was sent to apprise the tribe that the exchange would still be made if all the white captives were brought in as agreed, and several days afterward this arrangement was satisfactorily carried out. But the Comanches never forgot or forgave what they were pleased to term the white man's treachery, and they were not slow to strike a decisive blow for revenge.

In the summer of 1840, the warriors of the Comanche tribe prepared for a general invasion of the southernmost settlements west of the Colorado River. Early in August, a force variously estimated at from five hundred to one thousand braves, swept down from the Western prairies, and encompassed the town of Victoria, killing several of its citizens before they could recover from the confusion and consternation caused by the sudden and unexpected attack. The survivors fortified themselves in some of the stronger dwellings, and forced the Indians to withdraw, but they swept the country clear of horses and ...e, driving away with them several thousand head. Encouraged by their easy victory, the Comanches determined to attack the little seaport town of Linnville, situated some fifty miles south of Victoria, and approached this place in the dusk of early morning, concealing themselves by riding on their horses' sides, and in this way causing such of the inhabitants, who took note of their approach, to believe that it was simply a herd of ponies, being brought in from Mexico by some adventurous trader, seeking a market. The Comanches were in the heart of the town before their true character became known to its people. Many of the Texans were killed as they rushed from their homes in a frantic

attempt to escape, others were cut down on the beach, where the boats, their only refuge, were anchored in the shallow water. The Comanches followed the fugitives, even after they had gained the boats, as far as they dared venture on their mustangs, and the ripples on the surface of the bay were crimsoned with the blood of many innocent victims. History fails to give an estimate of the number who fell in this terrible massacre, but it must have been considerable, for no attempt at resistance was made, and the entire horde of red murderers were busied in the work of death. Several women and children were captured, and, after the remainder of the inhabitants had made their escape, the town was pillaged and fired.

Linnville had been a supply point for the settlements farther north and possessed several stores well provided with merchandise, therefore the quantity and character of the plunder taken by the Comanches can be imagined. Several hundred horses and mules were packed with the valuables secured, and gathering all the loose horses the Indians added them to the herd secured at Victoria, decking many of them with stolen ribbons and strips of bright colored cloth. The warriors were frantic with delight, and as they turned their immense drove of captured horses northwestward, their wild yells were wafted to the little flotilla of boats far out on the water, which held all that remained of Linnville's once happy and prosperous people. The flames and smoke of the burning town seemed to have an irresistible attraction to many of the braves, and they lingered around on the beach until the main body of the Comanches were far advanced on their return. News of the massacre was rapidly spread throughout the country, and while the Indians were hurrying to reach safety in the wilderness, couriers were speeding in every direction, and the Texans were assembling to a common center in companies. Luckily the trail made by the Indians in their descent had been discovered, and the alarm had spread before tidings of the Linnville disaster had reached the other settlements. An attempt to check the Indians in their retreat was made by Ben E. McCulloch with a small force gathered from the Guadalupe, Gonzales and Lavaca settlements, but in the face of such overwhelming numbers the Texans were forced to draw back and await re-enforcements. McCulloch was not idle, however, but by a forced march he again got far in the advance of the savages and stationed himself at Plum Creek, where he was joined by the companies of Captains Matthews, Ward and Bird. Captain Matthew Caldwell (familiarly known as "Old Paint") was present among others, and when on the morning of the twelfth of August his spies announced the approach of the Indians, he collected the little band of less than ninety men, all told, and in a short and inspirited speech counseled an attack. The words used by "Old Paint" on this occasion have been preserved, and though not remarkable for polished eloquence, still impress the reader with the commendable spirit that prompted their utterance. "Boys," he said, "the Indians number about one thousand. They have our women and children captives. We are only eighty-seven strong, but I believe we can whip hell out of them. What shall we do, boys? Shall we fight?" It is needless to state that an affirmative response was heartily given, and preparations for battle were hastily made. As Felix Houston, General of the Militia, was present, he assumed the command; but at this juncture Colonel Burleson came up with one hundred Texans and thirteen Tonkawa Indians, and swung into line to await the plunder-laden army of Comanches, which was now approaching and in full sight. A battle was inevitable, for the Indians could not afford to turn in a new direction with such an enemy to harass them in the rear; and, besides, they were flushed and confident from their past successes, and were in no respects averse to a general engagement. All they wished to gain was a sufficient delay to allow them to crowd their stolen horses on out of harm's way, and in the first part of the conflict this was given them in a measure, through General Houston's ignorance of Indian warfare and its methods. For a time the Texans stood and received the charges of the Indians and a continual arrow flight, replying with their rifles as occasion offered. Then, at Ben McCulloch's suggestion, General Houston ordered his little band of two hundred men to charge, and they rushed forward under their respective leaders, Placido, the Tonkawa chief, well in front with his trusty warriors, cleaving a pathway wherever their weapons gleamed. The warwhoops of the Comanches were echoed back in kind by those valued allies, while the fierce yells of the avenging Texans spoke of a determination to gain repayment for the blood that had flown at Linnville and Victoria. Before this determined rush the Comanches scattered like a partridge brood before the swoop of the prairie hawk. Their retreat became a disorganized rout, and they fled in every direction,

abandoning many of their pack animals and loose horses to the victors. The pursuit continued for ten or fifteen miles, but the Indians had no thought of making a second stand, and the Texans and their Tonkawa friends returned to the scene of the principal engagement, the former to collect the abandoned horses and other plunder left by the enemy, while the latter busied themselves in scalping the fallen Comanches and cutting off their hands and feet to be carried home as trophies. General Houston estimated that from fifty to eighty of the enemy had fallen since their retreat from Linnville had commenced, while in the engagement just described only a few of the Texans were wounded and none killed. Three of the captives held by the Comanches were transfixed with arrows when the retreat became general. The dead bodies of a Mrs. Crosby and a negro were found lying on the field, and a Mrs. Watts was shot in the breast with an arrow, but eventually recovered. She had been captured at Linnville, her young husband having been killed as he was conveying her through the shallow water to a boat.

About a month after the Plum Creek fight Colonel Moore was ordered to raise a volunteer force and follow the Indians who had taken part in that engagement and the preceding raid, to the coast. It was the commencement of October before he had succeeded in arranging everything for a start, and when he marched forth into the wilds his available force comprised ninety Texans and twelve Lipan Indians; the latter being taken along principally to serve as trailers and guides. Eighteen days after his departure, Colonel Moore's spies discovered an Indian camp of sixty lodges, supposed to contain about one hundred and twenty warriors, on the headwaters of the Colorado. The attack was made the following morning at daybreak, and the Comanches were driven from their village to the river. Hemmed in a semi-circular bend, with no chance of escape save by swimming, they were shot down by the Texans without mercy, men, women and children meeting the same fate. The Comanches had decided for a war of extermination and had forced the Texans to adopt their own policy, and now they were reaping the harvest they had sown. A portion of the band succeeded in crossing the stream, but were intercepted by Lieutenant Owen and a portion of the command and cut down, almost to a man. The fight was over in a half hour, and the Victoria and Linnville massacres were well avenged. One hundred and twenty-eight Comanches were lying dead in the bed of the Colorado or along its shores, and thirty-four prisoners were huddled together at the mercy of their captors. It was comparatively a bloodless victory so far as the Texans were concerned, for only two of their number had received wounds and neither were dangerously wounded. The scene of this battle has never been accurately located, but it was not far from the present town of Ballinger, in Runnels County.

The month of November, 1840, witnessed the massacre of a party of forty surveyors who, under the leadership of a land locator, named Sparks, was inspecting the country along the upper Brazos and Red Rivers. They were surrounded while sleeping in camp, and all but two of their number were instantly killed. Wires and Kellogg, the survivors, managed to evade capture, and separately reached the settlements in safety. In December of the same year a party of Texans, led by Major Howard, met a band of Comanches on Opossum Creek in Williamson County, and by alluring them into an ambuscade killed seven of their number without risk to themselves. This was, however, the last engagement of consequence that occurred between the Texans and their dangerous neighbors for several years. The savages had wearied of courting disaster by meeting the border riflemen in open battle, and even the powerful Comanches did not disdain to adopt the tactics formerly pursued by the Wacos and Caranchuas, skulking in small bands around the outskirts of the settlements and making isolated and poorly defended cabins the object of their attack. This method of procedure was to the pioneers the most annoying of any that they could have adopted. The presence of a half dozen Indians in a certain locality could rarely be detected until made known by some theft or act of bloodshed, while to maintain organized bands of home guards in every neighborhood was a matter of impossibility. In the vicinity of Austin—then a town of few inhabitants though it had been selected in 1839 as the future capital of the Republic—parties of Indians seemed to linger as though determined that the idea of a permanent settlement there should be abandoned, and in the years of 1841, '42 and '43 murders were committed within two or three miles of the spot whereon the State capitol now stands. There was no opportunity for reprisal, for in most instances the parties killed were waylaid and shot from the roadside, or pierced with bullets or arrows fired through the crevices between the logs of which their cabins were constructed. The same

state of affairs obtained in the settlements along the Red River in the Northern counties of the State, but principally in Grayson and Fannin, the authors of the atrocities in this region being the Shawnees, Cachattas, and other Indians who were generally supposed to be friendly to the whites. Occasionally a roving band would make a descent upon the Brazos and Little Rivers, but principally confined themselves to horse stealing; and it was while upon an incursion of this description that the noted chief, Big Foot, was killed in a fight with Captain S. P. Ross, as related in the biography of T. M. Carter in the biographical portion of this work.

An attempt was made in the spring of 1843 to persuade all the wild tribes of the frontier to enter into a treaty of peace, and Colonel J. C. Eldridge and Thomas Torrey were appointed commissioners to visit them, and arrange preliminaries. It was intended to have the chiefs of all the tribes meet with the representatives of the Republic of Texas at Bird's Fort, on the Trinity, in the following August, when it was believed they could be led into the desired arrangement. The three principal chiefs of the Delawares accompanied the peace ambassadors to act as interpreters and general assistants, as did also a Waco chief named Acequosh. Two Comanche children, who had been captured by the Texans about the time of the Linnville massacre, were taken along as a sort of peace offering to that yet powerful tribe, and it was generally hoped that the object of the expedition would be easily accomplished. Several of the less important tribes were visited, and their consent to the proposed meeting gained; but upon reaching the principal village of the Comanches, the council held to decide upon their proposition was unanimously in favor of putting the white men to death, and it required the utmost efforts of their Indian friends, and the favorable interference of the head chief as well, to carry them safely through their dangerous mission. Very little good was accomplished through this effort to secure a general peace, for, as has ever been the case, the Indians were lavish in their promises while they had not the slightest intention of carrying them out. Some of the minor tribes became less bold in their depredations because they recognized the suicidal results of any other policy, but the knives of the Comanches were never sheathed. Even had the principal chiefs of the tribe favored peace with the Texans, they could hardly have restrained wandering bands of their hunters from attacking the outlying settlements, or killing and scalping such defenseless whites as might be unfortunate enough to fall in their hands. Even while Colonel Eldridge was prosecuting his fruitless mission among the wild tribes, two important battles with the Comanches were fought in the Pan Handle country. Colonel Snively and a strong party of Texans had penetrated to the Northwestern boundary of the Republic, in hopes of capturing a train of valuable merchandise bound from Independence, Mo., to Santa Fe, but this attempt upon the supplies of their New Mexican neighbors, was frustrated by Captain Cooke, of the United States army, in command of the detachment which had escorted the train through the Kansas wilds. Crossing into Texan Territory, he captured and partially disarmed Colonel Snively's force, and delayed it in various ways until the arrival of a Mexican escort from Santa Fe, strong enough to render further attempts by the Texans futile. On his return to the settlements, Colonel Snively was twice attacked by the Comanches, on Owl and Antelope Creeks, but in both instances the Texans had the best of the fight, and kept their assailants at bay until an opportunity was given them to withdraw from the field.

In the spring of 1843 a party of twenty Caddos from the upper Brazos departed from the usual policy of their tribe and took the war-path against the whites. Their first victims were three men, Henry, Castleberry and Courtney, whom they surprised on Salado Creek, killed, scalped and stripped, and then mangled their bodies in a horrible manner. Proceeding to the Colorado River, twelve miles below Austin, they had collected a number of horses and had started on their return when they were discovered and pursued by a party of five Texans, who were armed only with mesquite clubs. As the Caddos had neither saddles or bridles and were driving the stolen horses on foot, they were soon overtaken, and on a smooth slope free from bushes where they had no opportunity to hide. In spite of their advantage in point of numbers and arms, the Indians did not dare to risk a hand-to-hand fight, and finding that they could not check the Texans with arrows, they suddenly dropped to their knees and commenced "fiddling" on their taut bow strings with their arrows, making a peculiar caterwauling sound that frightened the horses of their pursuers and caused them to turn and bolt in the opposite direction. Following this plan whenever close pressed, the Caddos finally reached shelter and escaped, though followed some twenty miles by an armed party which arrived too late to take part in the novel

encounter just described. One of the Texans received an arrow wound, but the injury inflicted was slight. Later, in the same year, the Lipans made a descent upon the settlements surrounding Austin, killing a couple of the citizens, and during 1844 and '45 an occasional outrage was committed as far east as the counties along the Brazos.

While the Mexican war was in progress the Indians of Western Texas were unusually quiet, probably awed into temporary peace by the spectacle of the immense armies which crossed Texan territory en route to the seat of war along the Rio Grande. Besides, McCulloch's company and others were kept continually on the frontier, and the savages were sharp enough to note the preparations made for their benefit and to conduct themselves accordingly. The ever restless Comanches were not altogether idle, but their attention was principally directed to the Mexican settlements lying west of the border, and which, through the centralization of Mexican troops for the defense of the capital city, was left wholly at their mercy. The annexation of Texas to the United States in 1846 was a hard blow to the Indians, for it arrayed against them the full power of the American Government. Years before, a captive chief had tauntingly said: "The Texan's hand is heavy, but his arm is short. His squaw is crying in the lodge of the Comanche, but he cannot reach her." Now all this had changed. The prairie tribes had felt the power of the "blue-coat braves;" they knew that their numbers were great, and on more than one occasion the mountains and prairies had rang with the thunder of their big guns. Heretofore the Indians could prey upon the Texan settlements and retreat for safety to American territory, but they feared that this convenient state of affairs had come to a termination. Possibly the Texans were of the same opinion, but the experience of nearly thirty subsequent years proved it a sadly mistaken one. A judicious distribution of troops along the Texan frontier at the termination of the Mexican war would have practically settled the Indian troubles. It was not made, and once more the entire border swam in blood, and was illuminated by the flames of burning homes. Gradually, as if feeling their way, the Comanches resumed their old-time raids after horse flesh and possible scalps, being most troublesome in Hays and Gonzales Counties, where they could reach the settlements unobserved by taking advantage of the broken ground along the Guadalupe River. The following incident, given in Wilbarger's work on the Indian troubles, is worthy of republication, since it shows how watchful the Texans were compelled to be in the protection of their homes and property, and to what an extent they were frequently indebted to the good offices of their allies, the friendly Indians.

"The traveler who passes San Marcos will see, north of the road, perched on the high bluff which overlooks the San Marcos head spring, a rude log house, built by General Burleson when he was, at that place, the outside settler. Hither came, from time to time, Placido, the Tonkawa chief, and his son, who were the friends of Burleson. Placido was a lithe, active Indian, every inch a warrior, who boasted that he had never shed the blood of a white man. When Placido made with his squaws his annual visit, General Burleson, who valued his services to Austin's early settlers, always made him presents of ammunition, and sometimes of ponies. During one of his visits, in 1848, Placido and his son were sitting down in Burleson's family room at his San Marcos spring house, conversing with General Burleson and his son Ed, who was about the age of the younger Indian. About nine o'clock at night what seemed to be the hooting of an owl was heard. Placido, whose quick ear discovered the cheat, rose instantly and covered up the blazing fire with ashes, at the same time whispering the word 'Comanche.' As soon as all had been made dark, he crawled upon the floor to the door and disappeared in the darkness. Quickly returning, he whispered to Burleson: 'Scurry stole; Comanche steal 'em.' Scurry was the name of a splendid horse presented to General Burleson by his friend, General Dick Scurry, a horse ridden by Scurry at the battle of Monterey. Fortunately, in a small stockade adjoining the house were the horses of Placido and two other horses belonging to the General. Though it was quite dark, these were quickly saddled, and the Burlesons, with young Placido, followed the old chief noiselessly around the mountain. Those who have been on that mountain will remember the level space near its summit, which belted it for more than a mile, varying from twenty to sixty feet wide, on which no bushes grew, while on each side was the dense cedar brake, through which no horseman could ride at night. Placido led the way in this open space, for he knew every foot of the mountain and the openings which led to the head of the Blanco, as well as the Comanches. In about

half an hour the moon arose, and Placido quickened the pursuit, sometimes through dense brush, where the rider could not see an arm's length before him, and then suddenly emerging in an open glade. The pursuit was continued without a word being spoken until after daybreak. The Comanches, never dreaming that pursuers were on their trail, had gone leisurely along until just before sun-up, when, as they were crossing an open prairie, they discovered the pursuers close behind them. Then began the race for life. There were three Indians; one rode Scurry and the others were mounted on ponies. Burleson's heavy weight, for he had then become corpulent, gave Placido and the two boys an advantage in the race, and he fell behind. The rider of Scurry could have escaped, but he remained in the chase close by his companions, though in the lead. As Placido and the two young men approached near the Comanches, General Burleson shouted: 'Big beef for Scurry, Placido big beef for Scurry.' Placido was slightly wounded by an arrow from one of the rear Indians, both of whom were quickly slain, but the rider of Scurry stood at bay, and was killed by a lance thrust by the Tonkawa chief, when the horse was taken back unhurt. The combatants were few, but seldom was ever a race ridden on Texas soil with more desperate resolve or more tragic end."

Young Ed. Burleson, who took an active part in the fight just described, received his first lesson in warfare as a mere boy on the field of Monterey. He had inherited his father's military spirit, and we find him in 1850, as a lieutenant in command of a ranger detachment, leading his men into an engagement with a force outnumbering them two to one and winning a signal victory. The fight occurred on the San Antonio and Laredo road, not far from the Nueces River. Three Indians were sighted, riding leisurely along about a mile from the road, and Burleson instructed his men to continue on their course, while, with nine volunteers, he galloped forth to kill or capture the savage trio who, as their backs were to him, seemed unaware of his approach. At last, when the two parties were separated by not more than fifty yards, the three Indians turned and revealed thirteen more on foot who had before been concealed from view by the horses. The rangers halted at this unexpected sight and looked to their lieutenant for orders, and Burleson took the initiatory by dismounting and opening fire. The Indians were armed with bows and lances and the rangers with carbines and revolvers, but as the savages charged up to within a few paces, firearms were but little more effective than arrows. Nearly all the rangers were wounded, Burleson being struck with an arrow which glanced from his skull but pinned his hat fast to his head. Baker Barton received three wounds, either of which would have proved fatal, and died standing erect, grasping the horn on his saddle. Several of the men received as many as four wounds each; but the Indians were suffering severely from the steady fire of the revolvers, a weapon then newly introduced, but with the use of which the rangers had already become quite well acquainted. Burleson had killed the chief in the outset of the encounter, and three other Indians had been slain while the majority of those remaining were wounded. Presently Burleson's interpreter gave the glad intelligence that the enemy were discussing the necessity of retreat, and a moment later they withdrew from the ground, the rangers being too badly cut up to think of pursuing them. The historian of this battle, after describing the death of the gallant Barton, continues: "William Lackey was wounded in three places. Jim Carr received four wounds. A warrior charged him, lance in hand, and was killed by Carr with a shot from his carbine. In an instant his carbine was again up and leveled at another Indian, who sent an arrow through his hand, penetrating the last joint of his trigger finger and the breech of his gun; the wood splintered and released his hand. Jack Spencer, though wounded, was charged by three Indians at the same time. He used his horse as cover, but received help from a comrade just in time. Alf, Tom and Jim Wilkerson, though desperately wounded, fought until the Indians retreated. During the fight, Leach and a wounded Indian were both prostrate on the ground, and but a few feet apart. Burleson's quick eye discovered the wounded Indian with a pistol in hand pointed at Leach, and turned his pistol to dispatch the Indian when Leach said: 'Save your fire, lieutenant. I've been watching him; he's only bluffing; there's no load in that pistol.'" Such was the material of which the early Texans were made; such the men who fought the savages on their own ground and never faltered in the face of overwhelming numbers. William Lackey, mentioned above, died from his wounds before the settlements were reached, but the others arrived at Fort McIntosh in ambulances sent out for their conveyance, and recovered to do further service against the Indians.

It would be ridiculous to claim that all the Texans were formed in heroic mould, for they were only human after all, and possessed their due share of human faults and weaknesses. Still, cowardice was so uncommon as to be thought worthy of especial mention. In the memoirs of "Big Foot" Wallace, one of the most noted Indian fighters of the Southwest, and who is still living, having survived the border wars of a half century, there appears the following anecdote and comments which have a direct bearing on the matter in question. While in charge of the mail coach running between San Antonio and El Paso, Wallace and his escort had a spirited encounter with a band of Comanches who surrounded the camp at night and were repulsed after a hard fight. Wallace says: "When the Indians were charging us so fiercely, I saw one of my men skulking behind a clump of prickly pears. I went to him and told him to come out and fight like a man. 'Cap,' said he, 'I would if I could, but I can't stand it.' I saw by the way that his hands shook and his lips quivered that he was speaking the truth. I replied, 'Well, stay there then if you must, and I will say nothing about it;' but some of the rest noticed him, and if I had not interposed they would have killed him, and I might just as well let them, for the poor fellow had no peace in his life afterward. I have seen two or three men in the course of my life who were naturally scary, and could not help it any more than they could help having bandy legs or a snub nose. They are born so and are more to be pitied than blamed. You might as well blame a man for not being as smart as Henry Clay as to blame him for not being as brave as Julius Cæsar; all the same, it is very aggravating to have them act in that way when the service of every one is needed as it was on this occasion. But after all, bravery is about as safe from harm as cowardice. This man was the only one wounded, with the exception of Fry. An arrow flew where he was hiding, struck him in the arm and pinned him to the prickly pear behind which he was concealed."

Several Indian fights of importance occurred during the year 1850, for the frontier was well patrolled by armed forces of Texans who made it a point to attack every band encountered unless the Indians gave good and sufficient proof of their friendliness. In consequence the sight of a plumed scalplock was generally a sure precursor of a "skrimmage." The Texans, as an old-timer once explained to the writer, had decided that the quickest way to deal with their red enemies was the best way, and it was easier to "pull down on every thing that came along," than to waste time asking an Indian if he wanted to fight. As early as 1847, a line of posts had been established along the northern border of the settlements, which quite effectually prevented the danger of an Indian descent catching the settlers unawares. Captain Shapley P. Ross' company was stationed on the Brazos near the present site of Waco; McCulloch's, on the Colorado, seventy miles above Austin; and Highsmith's company near Fredericksburg, while "Big Foot" Wallace, with a command of twenty rangers, was thoroughly patrolling the country along the Nueces River, and between that stream and the Rio Grande. Scouts from each of these commands met at intermediate points each week, thus keeping up a constant line of communication, while scouting parties were continually on the move, watching for Indians or any signs which would indicate the passage of war parties through the territory guarded. It was a practical adaptation to the military needs of the day of the plan known as "line riding," afterward adopted by the cattlemen of the Southwest; but, in this instance, instead of herding cattle within prescribed limits, the frontier line riders were herding the Indians out. Though this system of defense was abandoned all too soon, it proved during its continuance the best protection the settlers had ever known; and when ordered into the field in 1850 to protect the settlements between the Nueces and San Antonio Rivers, Captain McCulloch adopted a similar plan though on a smaller scale. Establishing his camp on the head of the Aransas River, he kept his scouts continually covering the field between the Nueces and San Antonio, and was soon able to call a halt on the continual depredations previously committed. A party of fifteen Indians succeeded in passing the line, but were followed by Lieutenant King and a detachment, and, after an all day's chase in a driving rain, overhauled and forced to make a stand in a deep ravine, from which the Texans could not dislodge them. McCulloch was on the ground next morning, at daybreak, with a reinforcement of twenty men, but the Indians had decamped, and were never overtaken. Later on McCulloch moved his camp to the North Fork of the Llano, and when on his first scout, with a force of twenty-two men, struck a trail which led him to a Comanche camp on a branch of the San Saba. The Indian band, which consisted of forty braves and two squaws, scattered

at the first charge, and only four of their number were killed. The squaws were captured, as was also all the camp equipage and horses, only one of the whites having been injured in the affair, and he by an arrow fired by one of the squaws before she could be disarmed. The squaws were afterward given a horse each and released, McCulloch telling them that all the captured goods and horses would be returned to the band if they would report at Fort Martin Scott, near Fredericksburg, within a month, and make a treaty of peace. This proposition was afterward accepted by the Comanches, and the commandant at Fort Martin Scott scrupulously carried out McCulloch's promises. This affair, with a severe handling received by a party of Comanches from Wallace's men on the Nueces, went a long way toward quieting matters temporarily, and for several years the settlers on the Southwestern frontier were accorded the blessings of comparative peace.

Now that Texas had become annexed to the United States and the conquest of Mexico had freed the State from all danger of foreign invasion, a heavy influx of immigration followed, nearly all the Northern and Eastern States adding their quota, while colonists from different European countries began establishing themselves in the counties adjacent to the coast. Gradually the settlements began to extend further northward along the upper course of the rivers, while those originally established along the Red River, in Grayson and Fannin Counties, spread southward until they met and mingled with those in the region then known as the "Three Forks" of the Trinity. The first cabin, in what is now Dallas County, had been erected in 1841, and the organization of the county followed five years later, though at that time it contained but a handful of inhabitants. At about the same time a few families settled along the Clear Fork, in Tarrant County, and in 1849 a military post was established at Fort Worth, its position then being on the extreme Western frontier. Protected by this and other outposts, the country to the eastward rapidly filled with settlers, and for a time the entire State seemed to have entered upon an era of peace as well as prosperity. For the first time in the history of the country its inhabitants could pursue their daily avocations without a constant fear of lurking danger. Farms were opened and cultivated, yielding abundant returns. Wagon trains loaded with cotton bales moved slowly along the rough trails leading to shipping points on Red River or Buffalo Bayou, and, returning, brought to the settlers supplies of every imaginable description. The cattle industry, then in its infancy, was beginning to receive notice as a pursuit that might in time be made profitable, and instead of huddling their cabins close together for protection's sake, the pioneers of the Northwestern prairies had begun to appreciate the value of "elbow room," locating with an eye to the best grass and water, and objecting strongly to the presence of a neighbor in their immediate "range."

But while in some respects this policy of isolated ranches had its advantages, it offered to the Indians tempting opportunities that were not to be refused. The buffalo were being driven from the country by the advent of the whites, and so, in lieu of his accustomed food, the Indian contented himself with the choicest cuts from the best animal of some settler's herd, at the same time providing for his friends, the wolves, by transfixing with his arrows a half dozen more cows or steers in a spirit of mere deviltry. If the ranchman's horses wandered from the immediate vicinity of his cabin, they vanished as suddenly as if a cyclone had swept them from the earth. Sometimes a settler and his family would be killed and scalped, but for a period of years such occurrences were infrequent. Though unable to entirely curb their thievish nature, the Indians were not courting trouble, and had learned how far they could go with impunity. By perusal of the biographical portion of this work, it will be found that many references are made to the friendly spirit shown by nearly all the prairie tribes during the early '50s. It was a period of peace, and while this state of affairs continued to exist the settlers obtained a foothold in what is popularly termed the "Upper Cross Timbers," and their log cabins began to dot the slopes of the Palo Pinto and Jack County hills.

But the knives and tomahawks of the Comanches were not long permitted to rust in idleness, and this golden era of fancied security for the settlers was brought to an abrupt termination. In the renewed outbreak of hostilities, the farmers and ranchmen who had established themselves along the Brazos, in Bosque County, were the first sufferers, for their location was so remote from any military post that the Indians could strike there with assurance of ample time to distance effective pursuit. It is possible that the first blood was shed by some prowling band without premeditation, but the sight of freshly taken scalps was all that was needed to break the unaccustomed restraint upon their savage nature, and other murders followed in rapid order.

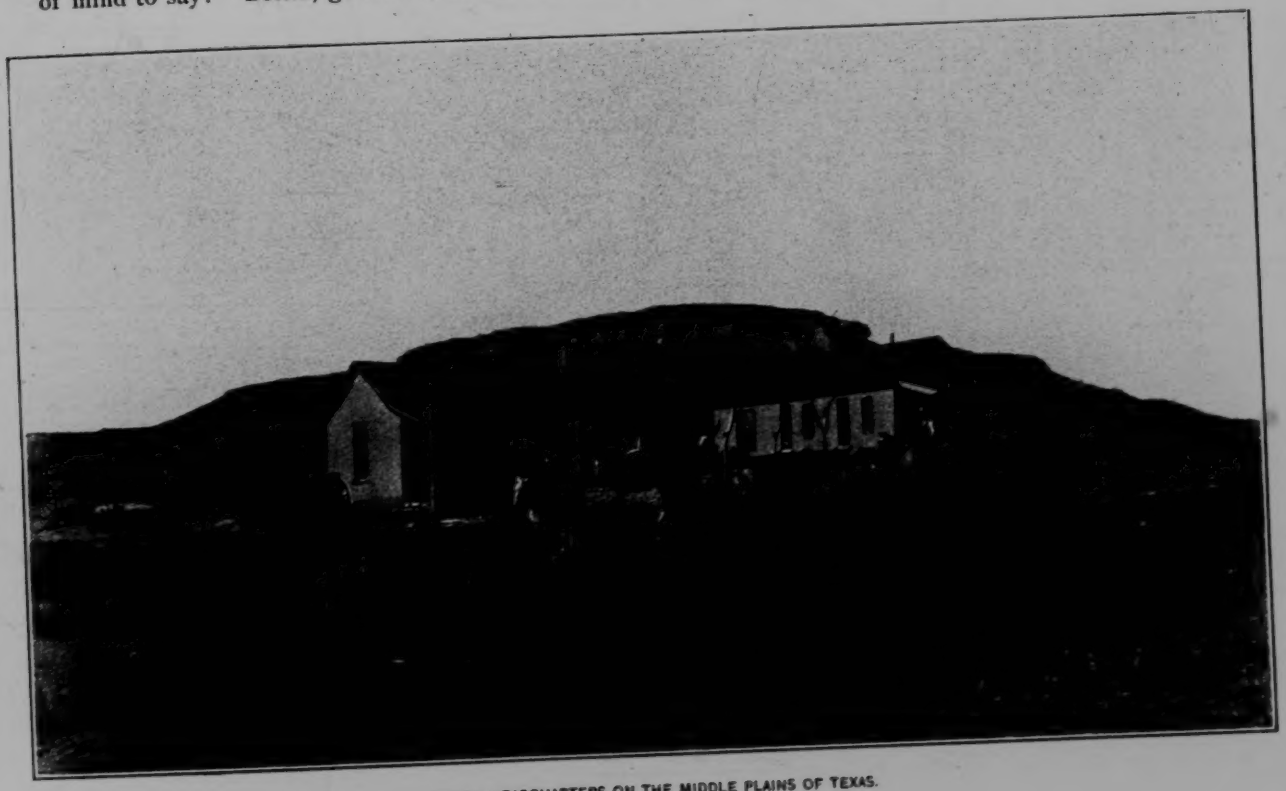
In the winter of 1856-57 a Mr. Renfrew and his son were horse hunting on the head of Meridian Creek, when they were attacked and both killed. The young man was shot dead at the first fire and scalped, but the father rode several miles after receiving a fatal wound, at length falling dead from his horse, which ran riderless home, its blood-stained sides telling to the agonized family the story of the loss sustained. A party searched long and earnestly for the missing men, and some two weeks later the body of the younger man was found, but the remains of the father were not discovered until after the lapse of two years. A few days later a Mr. Bean and a negro servant, returning from some of the larger settlements with a load of corn, were killed after a long fight, in which the Indians were supposed to have suffered considerable loss. The murdered men had evidently used the wagon as a defense, as its bed was pierced in many places with bullets and arrows. The following day the same party of Indians, who had evidently decided that the safest plan was to waylay the Texans at a distance from their homes, murdered a Mr. Johnson, who was returning to the settlement with a load of flour and meal, and carried his eight-year-old boy away a prisoner. They afterward stripped the child of all his clothing, and, while camped fully forty miles from the nearest house, he managed to slip away from them in this nude condition, and wandered around, half dead with cold and starvation, until discovered by some men who were trailing a party of Indian cattle thieves. The boy had found some milk cows that had escaped from their savage captors, and was following them as closely as possible, thinking that they would protect him from the wolves, and possibly lead him back to the settlements. Other atrocities followed closely on the heels of those just mentioned.

"During the first week in March, 1857," says James T. De Shields, one of the best informed and most conscientious historians of this troublous period in the history of the Texan border, "a large band of marauding Indians came down, and, on approaching the frontier, divided into squads of eight and ten, and simultaneously entered Erath, Brown and Comanche Counties, and began depredating in the most daring and alarming manner. A severe drought the previous year had caused an entire failure in crops, which was followed by a severely cold winter, which had reduced what few cow-ponies the settlers had left so thin in flesh that very few were able to do any kind of service; in fact, most of the citizens were literally afoot. Bread-stuffs had to be bought and freighted on ox wagons from Fannin, Grayson, Collin and Dallas Counties. While in this helpless condition, three squads of Indians began depredations at the same time in different parts of Comanche County. One squad of ten passed down the South Leon Valley in open day, gathering what few horses they could find, and four miles below Old Cora (now extinct), on the 3d day of March, 1857, they came upon Gid Foreman and killed him, taking off every vestige of hair with his scalp. Foreman had red hair, which is a great trophy among Comanche Indians. They stripped Foreman, save his drawers, and mutilated his body in a most horrible manner. After butchering the unfortunate man, and tying his reeking bloody scalp to one of their belts, they proceeded down the valley and crossed the North Leon, and about five o'clock p. m. approached John Baggett's ranch, near the present town of Hazel Dell, driving up into the yard and catching the only horse Baggett had left.

"Now, come, ye sentimental lovers of heaven's noblest gift to man—a wife and mother—and view with me this terrible tragic scene, no *ignis fatuus*, no fiction or imaginary concoction of the brain, but a reality. A lone woman, with nine helpless children, with no chance of escape and no means of protection, not even a gun (Mr. Baggett had that with him), and surrounded by ten steel-hearted, fiendish savages, in whose veins the milk of human sympathy had never flowed, with hideous visages made doubly frightful by being bedaubed all over with war-paint, and uttering fiercely their most diabolical warwhoops, their dark bodies besmeared and their hands still dripping with the life blood of Foreman, whose gory scalp was still dripping the crimson fluid and hanging to a fiendish savage, whose greatest delight was in torturing his most innocent victim, while the excruciating suffering and agonizing cries only served to increase his merriment. Mrs. Baggett succeeded in getting seven of the children into the cabin while the savages were catching the horse. But, alas! Oh, horror of horrors! Two of the children, little Joel, twelve, and little Bettie, ten years old, were under a live oak tree, playing, some sixty yards from the cabin, and were intercepted, caught, and four of the savages proceeded to strip off every vestige of clothing that the children had on, and proceeded slowly, so as to prolong the sufferings of little Joel and to increase and intensify a mother's agony, in torturing the little fellow to death by lancing him with arrows in every conceivable way to produce the most acute and excruciating

suffering; and to make his lifeless form appear the more ghastly and horrible, while his plaintive, piteous shrieks were still audible to a mother's ears, one of the savages, to whose belt was hanging poor Foreman's gory scalp, proceeded before life was extinct in little Joel, to scalp him, and hung the scalp on the opposite side of his belt as an additional trophy to heighten the pleasure of their fiendish war dances.

"But is this all of this frightful tragedy? No. Not content with torturing, scalping and killing little Joel, but if possible to add to a mother's already overflowing cup of sorrow and grief, mentally equal to a Spanish inquisition, those barbaric and unfeeling savages proceeded to lance little Bettie in twenty places, in three places to the hollow, then turning her loose to go bleeding, staggering, and fainting twice before she reached the house. On reaching the house, Mrs. Baggett still had the presence of mind to say: 'Bettie, go around to the other door; the Indians will kill us all if mamma opens this



RANCH HEADQUARTERS ON THE MIDDLE PLAINS OF TEXAS.

door.' Four of the Indians had followed the child to within twenty paces of the door, thinking, no doubt, that Mrs. Baggett would be imprudent enough to come out and meet the child, but she well knew her own life and that of her other seven children depended upon her remaining in the house. So, failing in this, the savages remounted and rode off just before dark, and as soon as they left, Mrs. Baggett carried in the lifeless and mangled body of her boy, and had washed and dressed it before the father's return, one hour after dark. To attempt to describe the feelings of Mrs. Baggett on this occasion would be an utter failure, and a mockery of the sublimest fortitude and courage, known alone to mothers. Indeed, no language, except it be that of angels, is capable of describing such a scene, or a mother's love. Little Bettie got well, grew to womanhood, married, and is now the wife of a wealthy and respected gentleman, living at Abilene, Tex. Mr. and Mrs. Baggett are both dead."

A forcible word painting of a horrible incident. Unfortunately, the murder of Foreman and Joel Baggett were but two among scores of similar occurrences, and the natural ferocity exhibited by the perpetrators of these crimes showed too well that the nature of the red man in his original state of

savagery was unchangeable as that of the tiger. The thirst for blood was inborn, and if temporarily restrained would inevitably break forth again fiercer than ever. The night following the above mentioned tragedy another squad of Indians ventured almost into the town of Comanche, and within twelve hundred yards of the public square came in collision with a party of home guards raised to repel a reported invasion. It was an unexpected meeting to both parties, and after a short fight, in which one Texan was killed and another severely wounded, they withdrew to the shelter of the town, leaving the Indians in possession of the ground. Through this raid in Comanche and adjoining counties the Indians were enabled to accurately locate nearly all of the more exposed settlements, and the information thus obtained was soon turned to account. During the autumn of 1857 the valleys of Pecan Bayou, and the adjacent streams tributary to the Brazos and Colorado, were frequently visited by small bands of Comanches, rarely more than eight or ten strong, who patrolled the country with but little attempt at concealment, attacking every defenseless person they chanced to meet. In November a squad of eight attacked Brooks Lee, near the present town of Brownwood, but he managed to find shelter behind a fence and repelled their charge with his six-shooter, killing the leader at the first fire and escaping in the confusion which followed. A few days later a Mr. Lewis was shot through with an arrow and instantly killed, near the mouth of Stepp's Creek, this being the first white man murdered by the Indians in Brown County after its first settlement in 1854. After committing this murder the Indians made a circuit through Lampasas and Bell Counties, and then turned back through Coryell County, passing north of Gatesville. On Owl Creek they attacked and killed two men, Brown and Pierce, who, with the assistance of a little boy named Dave Elam, were hauling rails. The boy managed to make his escape, and, a few years ago was still living, making his home in Coryell County. There were seventeen of the Indians at the time Brown and Pierce were killed, and their raid had proven a successful one, for when they divided in three squads in the north part of Coryell in order to insure getting home with a portion of their stolen stock, each squad was in possession of 150 horses. The separate routes chosen were, up the valleys of the Leon, Lampasas and Cowhouse, and they had apparently intended to join forces again at Salt Creek Mountain, in Brown County. Fortunately, the party that went up the Leon were discovered by the mail carrier bound for Brownwood, who quickly gave the alarm, and twelve well-armed Texans immediately gave chase. As Salt Creek Mountain was the highest point in the direction the Indians were pursuing, the whites made that their objective point, thinking that they could reach it in advance of the marauders and from that high eminence discover them as they passed. The Indians, however, reached the mountain before them, and just at daybreak were discovered in camp in a ravine near its foot. The Texans charged them, killing two, both of whom fell to the revolver of their leader, Dan Cox. The other Indians, three in number, escaped, leaving two of the attacking party with slight arrow wounds as mementoes of their affection. The other parties of Comanches were camped within hearing of the firing and hastily hurried their stolen horses out of such a dangerous locality, escaping without molestation.

This raid and others of smaller consequence following immediately after, were the first circumstances leading up to that border disturbance generally termed the "Reservation War." In 1855, the United States Government had taken up the task of civilizing the Texan Indians, and, in pursuance of the customary policy, had established two considerable colonies on reservations granted by the State in Young County. It was argued that the Indians had been forced to resume their predatory raids through starvation, the wild game which was their principal means of subsistence having in a great measure disappeared before the encroachments of civilization, and it was believed that all trouble from this source would cease if efforts were made to provide for the Indians' immediate wants, and to aid and instruct them in the cultivation of crops, and the raising of domestic animals for food. The locations chosen for the colonies were as favorable as the State could supply. The larger of the two comprised eight leagues of land, and was situated on the Brazos below the mouth of Clear Fork, and some fifteen miles from Fort Belknap. On this reservation seven hundred and ninety-four Indians were induced to locate, the colony being composed of the remnants of the Tonkawa, Tahwacorro, Waco, Anadarko, and Caddo tribes. The second reservation, of four leagues, was occupied by two hundred and seventy-seven northern Comanches, and was situated on Clear Fork, some forty-five miles above its mouth. Every provision was made for the comfort and welfare of these wards of the government, and for a time the

reports of the agents in charge seemed to indicate that the experiment of colonization must prove a flattering success. The Indians were quiet and well behaved, they abstained voluntarily from the use of intoxicants, and their morality and industry surprised even the best friends of this confessedly doubtful undertaking. The Comanches were less apt than their neighbors in adapting themselves to their changed surroundings, but this was naturally to be expected, for they had not enjoyed the advantage of such a long period of friendly intercourse with the whites, and were totally ignorant of everything pertaining to civilized life. However, they proved willing and observant scholars, and their progress, from the first, was encouraging to the highest degree.

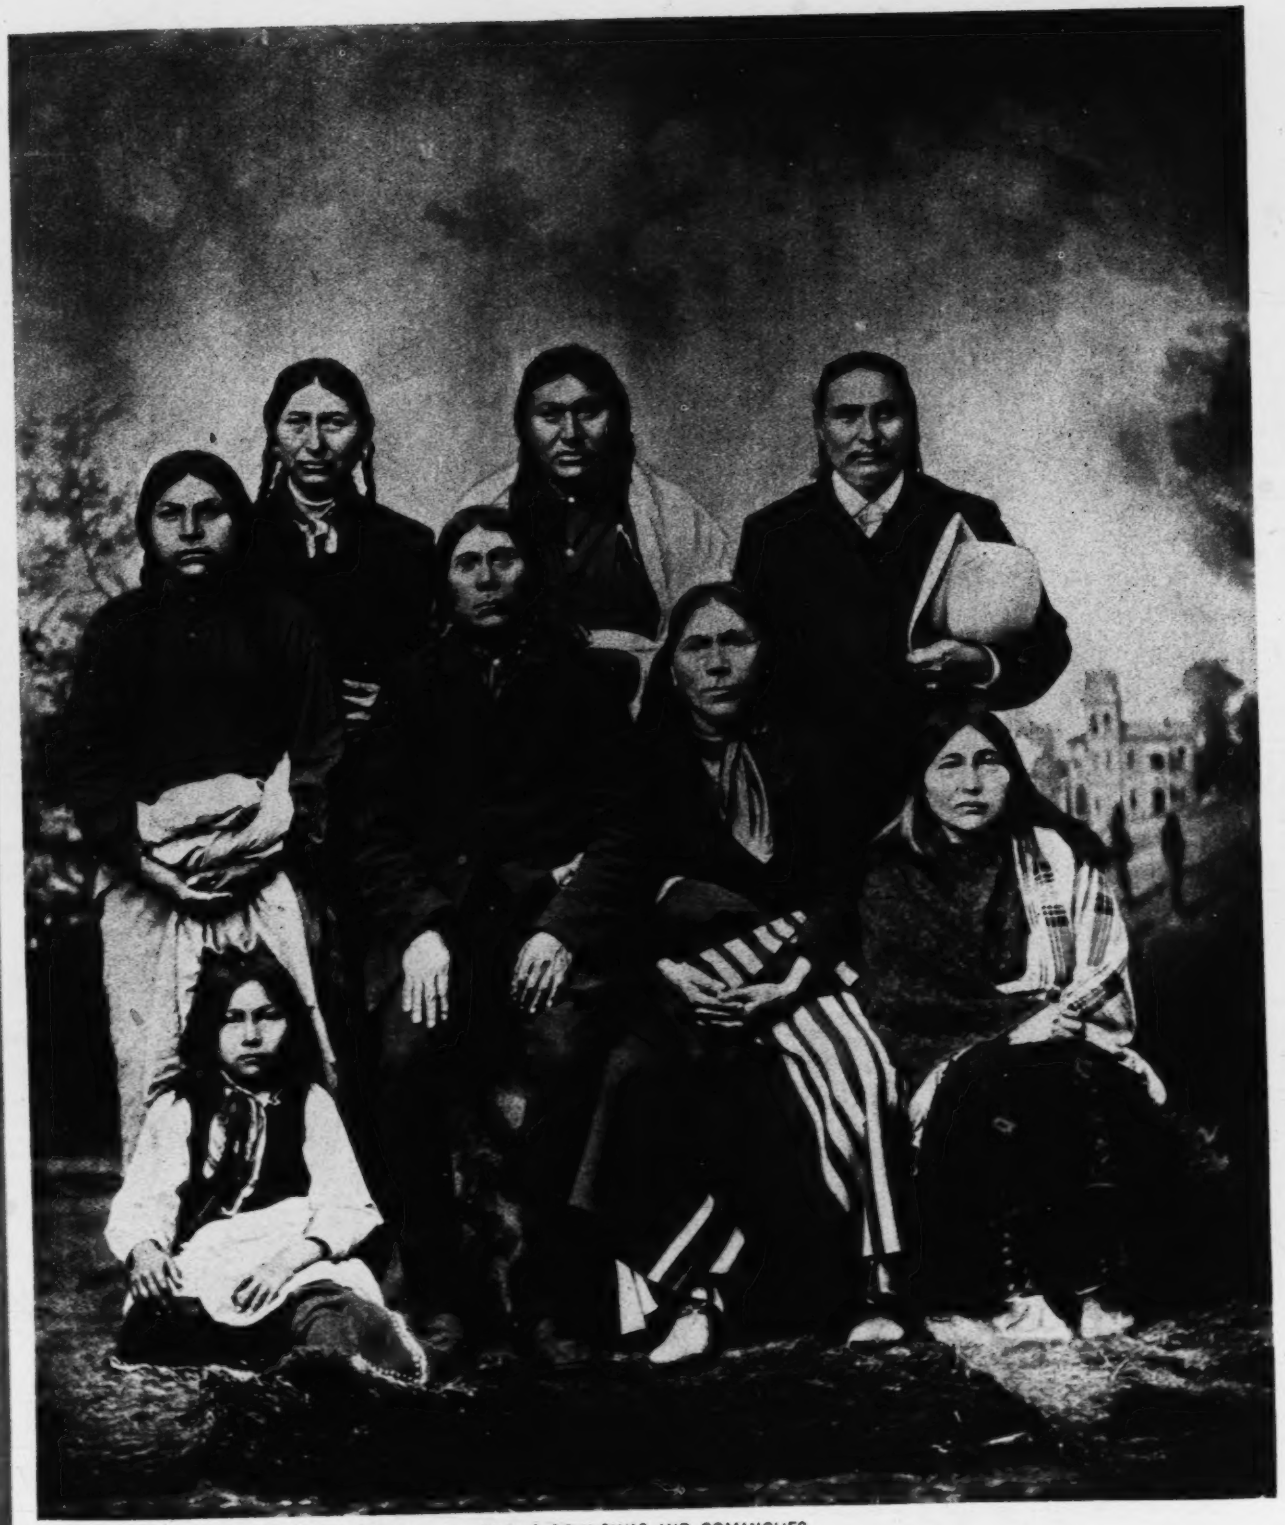
By the end of the third year both of the little colonies were in a highly prosperous condition. The Indians in the Brazos Reservation had broad fields under cultivation; they had built themselves comfortable dwellings and school houses, and their herds of cattle and horses were rapidly growing. They had also proven an efficient aid in the protection of the Northwestern frontier, and, in the spring of 1858, had furnished a band of fifty or more warriors to co-operate with the rangers in an expedition against the hostile tribes. If there had been a possibility of keeping them continually within the limits of their reservation, the future of these reclaimed savages would have been a peaceful and prosperous one; but it was not to be expected that they would submit to a total deprivation of all liberties. The prairies farther west still teemed with buffalo and antelope, and the Indians asked and were granted the privilege of making short hunting expeditions for the purpose of providing themselves with meat. Consequently their exact whereabouts could not always be determined; and when depredations once more became common through the counties lying farther to the southward, suspicion was naturally directed toward the Indians of the reservations. Later, it was discovered, upon trailing the bands which were robbing and murdering in Bosque and Coryell Counties, that they invariably separated, the greater number going, with the stolen horses, to the westward, while a portion of the party bore away toward the mouth of the Clear Fork as though heading direct to the reservations. This may have been a part of a cunningly laid scheme on the part of the hostile Indians to direct suspicion against their half-civilized neighbors, but such a supposition was hardly worthy of credence. In the minds of the greater number of whites the guilt of the reservation Indians was established beyond a reasonable doubt, and an outbreak of public opinion became every day more imminent.

In the meantime the murderous work in the central counties of the State continued without abatement. Early in January of 1858, several bands of Indians made their presence felt in the customary way, and their depredations became of daily occurrence. A party of eight attacked and lanced a negro at Barbee's ranch in Erath County, but though left for dead, he recovered to glory over his escape. He was not scalped, the shortness of his wool protecting him from this torture. Proceeding on through Erath and Comanche Counties, the Indians committed several murders and collected a large herd of horses, and escaped without coming in collision with the party of settlers which had been raised for their pursuit. The excitement caused by this raid was supplemented by news of similar occurrences in adjacent counties, and it was finally decided to send a detachment of troops against the Comanches in their strongholds in the Canadian Hills. It was an expedition fraught with great danger, for it was known that the Comanches could put an enormous force in the field, and the bravery of the warriors of this tribe was beyond question. The home of the Comanches was in the Antelope Hills on the South Canadian, where they had ever found safety when returning from their innumerable raids against the whites and Mexicans. The head war chief and prophet of the tribe was Pohebits Quasho (Iron Jacket), who took his name from the fact that he invariably went into battle protected by a coat of mail—once worn, perhaps, by some Spanish knight under the banner of De Soto or De Leon. He had grown too old, however, to continue active on the warpath, and the actual command of the warriors had devolved upon a daring young chief, Peta Nocona, who, as it was afterward learned, had taken for his wife the captive Cynthia Ann Parker, one of the survivors of the Parker Fort massacre chronicled in the first part of this chapter. The force sent against the Comanches consisted of one hundred Texan Rangers under Colonel John S. Ford and Captain S. P. Ross, and were accompanied by one hundred and thirty-five Tonkawa Indians led by the redoubtable Placido. The story of this expedition and the struggle with the Comanches in their mountain fastness has been so well told by an earlier writer that it would be an act of presumption to attempt to improve upon his spirited description, which is accordingly given below.

"After a toilsome march of several days the Tonkawa scouts reported that they were in the immediate vicinity of the Comanche encampment. The Comanches, though proverbial for their sleepless vigilance, were unsuspicious of danger; and so unsuspected was the approach of the rangers, that on the day preceding the battle, Colonel Ford and Captain Ross stood in the old road from Fort Smith to Santa Fe, just north of the Rio Negro or False Washita, and watched through their glasses the Comanches running buffalo in the valleys still more to the North. That night the Tonkawa spies completed the hazardous mission of locating definitely the position of the enemy's encampment, and the next morning (May 12) the rangers and reserve, or friendly Indians, marched before sunrise to the attack. Placido claimed for his red warriors the privilege of wreaking vengeance upon their hereditary enemies. His request was granted and the Tonkawas effected a complete surprise. The struggle was short, sharp and sanguinary. The women and children were made prisoners, but not a Comanche brave surrendered. Their savage pride preferred death to the restraints and humiliations of captivity. Not a single warrior escaped to bear the sorrowful tidings of this destructive engagement to their people.

"But this was only a minor encampment. A short time after the sun had lighted the top of the hills, the rangers came in full view of the principal camp, pitched in one of the picturesque valleys of the Canadian, and on the opposite side of the stream, in the immediate vicinity of the famous Antelope Hills. The panorama thus presented to the view of the rangers was beautiful in the extreme, and their pent up enthusiasm found vent in a shout of exultation, which was speedily suppressed by Colonel Ford. Just at this moment a solitary Comanche was descried riding southward, evidently heading for the village which Placido had so recently destroyed. He was wholly unconscious of the presence of an enemy. Instant pursuit was now made; he turned and fled at full speed toward the main camp across the Canadian, closely followed by the rangers. He dashed across the stream, and thus revealed to the rangers the locality of a safe ford across the miry and almost impassable river. He rushed into the village beyond, sounding the notes of alarm, and soon the Comanche warriors presented a bold front of battle, lined between their women and children and the advancing rangers. After a few minutes occupied in forming line of battle, both sides were arrayed in full force and effect. Colonel Ford's object was to deceive the Comanches as to the character of the attacking force and the quality of arms they possessed. Pohebits Quasho, arrayed in all the trappings of his war toggery—coat of mail, shield, bow and lance, completed by a head dress decorated with feathers and long red flannel streamers, and besmeared in war-paint—gaily dashed about on his war horse midway of the opposing lines, delivering taunts and challenges to the whites. As the old chief dashed to and fro, a number of rifles were discharged at him in point blank range without any effect whatever, which seeming immunity to death encouraged his warriors greatly, and induced even some of the more superstitious among the rangers, to inquire within themselves if it were possible that Old Iron Jacket really bore a charmed life. Followed by a few of his braves he now bore down upon the rangers, gave a few necromantic puffs with his breath, and let fly several arrows at Ford, Ross and Placido, receiving their fire without harm. But as he approached the line of Tonkawas, a rifle directed by the steady nerve and unerring eye of one of their number, Jim Pockmark, brought the Big Medicine to the dust. The shot was a mortal one. The fallen chieftain was instantly surrounded by his warriors, but the spirit of the conjuring brave had taken its flight to the happy hunting grounds.

"These incidents occupied but a brief space of time, when the order to charge was given; and then ensued one of the grandest assaults ever made against the Comanches. The enthusiastic shouts of the rangers, and the triumphant yell of their red allies greeted the welcome order, and was responded to by the defiant warwhoop of the Comanches; and in those virgin hills, remote from civilization, the saturnalia of battle was inaugurated. The shouts of enraged combatants, the wail of women, the piteous cries of terrified children, the howling of frightened dogs, the deadly reports of rifle and revolver, constituted a discordant confusion of infernal noise. The conflict was sharp and quick; a charge, a momentary exchange of rifle and arrow shots, and the heart-rending wail of discomfiture and dismay, and the beaten Comanches abandoned their lodges and camp to the victors and began a disorderly retreat. But sufficient method was observed to take advantage of each grove of timber, each hill and ravine, to make a stand against their pursuers, and thus enable the women and children to make



GROUP OF KIOWAS AND COMANCHES

The Indian standing on right is the noted "Lone Wolf."

their escape. The noise of battle now diverged from a common center like the spokes of a wheel, and continued to greet the ear for several hours, gradually growing fainter as the pursuit disappeared in the distance. But another division, under the vigilant Peta Nocona, was soon marching through the hills north of the Canadian to the rescue. Though ten miles distant, his quick ear had caught the first sound of battle; and soon he was riding, with Cynthia Ann by his side, at the head of five hundred warriors.

"About one o'clock in the afternoon the last of the rangers returned from the pursuit of Pohebits Quasho's discomfited braves, just in time to anticipate this threatened attack. As Captain Ross, who was the last to return, rode up, he inquired: 'What hour of the morning is it, Colonel?' 'Morning!' exclaimed Colonel Ford, 'it's one o'clock of the afternoon.' So unconscious is one of the flight of time during an engagement that the work of hours seems comprised within the space of a few moments. 'Hello! What are you in line of battle for?' asked Ross. 'Look at the hills there, and you will see,' calmly replied Colonel Ford, pointing to the hills some half a mile distant, behind which the forces of Peta Nocona were visible, an imposing line of five hundred warriors, drawn up in battle array. Colonel Ford had, with two hundred and twenty-one men, fought and routed over four hundred Comanches, and now he was confronted by a stronger force, fresh from their village, still higher up the Canadian. They had come to drive the 'pale faces' and their hated copper-colored allies from the captured camp, to retake prisoners, to retake over four hundred head of horses and an immense quantity of plunder. They did not fancy the defiant state of preparations awaiting them in the valley, however, and were waiting to avail themselves of some incautious movement on the part of the rangers, when the wily Peta Nocona, with his forces, would spring like a lion from his lair, and, with one combined and desperate effort, swoop down and annihilate the enemy. But his antagonist was a soldier of too much sagacity to allow any advantage to a vigilant foe. The two forces remained thus contemplating each other for over an hour, during which time a series of operations ensued between single combatants, illustrative of the Indian mode of warfare, and the marked difference between the nomadic Comanche and his semi-civilized congener, the Tonkawa. The Tonkawas took advantage of ravines, trees and other natural shelter. Their arms were rifles and six-shooters. The Comanches came to the attack with shield and bow and lance, mounted on gayly caparisoned and prancing steeds, and with flaunting feathers and all the gorgeous display incident to savage show and pomp. They are probably the most expert equestrians in the world. A Comanche warrior would gayly canter to a point half way between the opposing lines, yell a defiant warwhoop, and shake his shield. This was a defiance to single combat. Several of the friendly Indians who accepted such challenges were placed *hors de combat* by their more expert adversaries, and in consequence Colonel Ford ordered them to decline the savage banters, much to the dissatisfaction of Placido, who had conducted himself throughout the series of engagements with the bearing of a savage hero.

"Colonel Ford now ordered Placido to advance with a part of his warriors in the direction of the enemy, and if possible draw them into the valley, so as to afford the rangers an opportunity to charge them. This had the desired effect, and the rangers were ready to deliver a charge, when it was discovered that the friendly Indians had removed the white badges from their heads, because they served as targets for the Comanches; consequently, the rangers were unable to distinguish friend from foe. This necessitated the entire withdrawal of the Tonkawas. The Comanches witnessed these preparations, and now commenced to recoil. Lieutenant Nelson made a skillful movement, and struck the enemy's left flank. The Comanche line was broken, and a running fight for three or four miles ensued. The enemy was driven back wherever he made a stand. The most determined resistance was made in a timbered ravine. Here one of Placido's warriors was killed, and one of the rangers, young George W. Paschal, wounded. The Comanches left some dead upon the spot, and had several more wounded. After routing them at this point, the rangers continued to pursue them some distance, intent upon taking the women and children prisoners; but Peta Nocona, by the exercise of those commanding qualities which had often before signalized his conduct on the field, succeeded in covering their retreat, thus allowing them to escape. It was now about four o'clock p. m., both horses and men were almost entirely exhausted, and Colonel Ford ordered a halt and returned to the village. Brave old Placido and his warriors fought like so many demons. It was difficult to restrain them, so anxious were they to

wreak vengeance upon the Comanches. In all these engagements seventy-five Comanches bit the dust. The loss of the rangers was small—two killed and five or six wounded."

Though in the combat so graphically described, the chief, Peta Nocona, was neither killed or captured, but escaped with his pale-faced bride and their children to a place of safety, accompanied by the greater portion of his people, the lesson taught the Comanches by the dauntless rangers and their faithful allies, might have been accepted as a warning of more crushing defeats to follow in case their depredations on the helpless settlers of the Texan border should continue. But the spirit of the tribe was still unbroken, and in the following September a second expedition was directed against them. On this occasion Major Van Dorn of the United States army was in command, but the troops were accompanied by an auxiliary force of one hundred and thirty-five friendly Indians led by Captain Ross, one of the bravest and most skillful Indian fighters developed by this period of border warfare. The Indian village was discovered near the Wichita Mountains, strung out for several hundred yards along the banks of a little stream. The command divided and charged from opposite sides, crushing the Indians between the two columns. The squaws and children attempted to retreat along the stream, and mistaking them for warriors in the fog of the morning, Captain Ross, with two or three men, ran their horses to intercept them. Ross soon discovered his mistake, but finding a little white girl among the fugitives, he captured her and placed her on a horse ridden by a Caddo Indian. By this time the little party, consisting of Ross, Captain Van Camp, a soldier named Alexander and the Caddo, were cut off from the main command, and were charged furiously by some twenty-five Comanches. All three of the whites were shot down before they could raise an arm in their own defense, and Van Camp and Alexander were killed. Ross was badly wounded, and one of the Indians was advancing on him with a drawn knife when the cavalry dashed in to his assistance, and scattered the assailants like chaff. Through all this the Caddo had clung to the little girl, and was uninjured, the Comanches fearing that the girl would be killed if they fired upon him. By this time the battle was virtually over. Eighty or ninety Comanches had fallen, several had been captured, and many of those who escaped bore severe wounds. Major Van Dorn was pierced with an arrow, and was, for a time, supposed to be mortally wounded, while five of the whites were killed and several wounded. It was five or six days before the wounds of the two officers would admit their being conveyed from the battle ground, but in due course of time the victorious army returned to the settlements without encountering any opposition from the thoroughly cowed Comanches. The little white girl recovered on this occasion, was adopted and educated by Captain Ross, and married, years later, a prominent and wealthy merchant of California.

The minor depredations on the settlers and ranchmen of the Northwestern frontier continued, and as it was generally considered that the Comanches had been forced into a temporary peace, public opinion became more strongly turned than before against the Indians of the Brazos Reservation. It was eventually proven to the general satisfaction that Indians from the Comanche Reservation had taken part with the wild tribes in horse stealing expeditions, and this evidence was accepted as proof that all the reservation Indians were alike guilty. Affairs were rapidly coming to a crisis when an event occurred to hasten a solution of the trouble. A hunting party from the Brazos Reservation—men, women and children—had been encamped for several weeks at the mouth of Keechi Creek, and had abstained, so far as known, from disturbing the peace or property of any one. However, their location at a point so far from the limits of the reservation gave offense to a certain class of the whites, and a party of settlers, principally from Erath County, determined upon their destruction. A company was organized and Peter Garland appointed its leader, and it started forth under instructions to kill any Indians found south of Cedar Creek. The camp on the Keechi was the first object of their attack, the expedition having been originated for that purpose solely. There were eight men and women and eleven children in the camp at the time, and all were soundly sleeping when the whites crept cautiously up and poured in a murderous volley of lead from shotguns and rifles. Four men and three women were instantly killed, and nearly all the rest were wounded, but managed to escape to the reservation.

When the news of this outrage spread, the country was immediately in an uproar. The act was denounced by proclamation by the chief executive of the State, and all persons were warned against joining organizations against the friendly Indians; but the press and public sentiment was arrayed on the opposite side of the question, armed bands of whites patrolled the region adjacent to the reservation

with an avowed intention of killing every Indian encountered, and it was soon plainly to be seen that nothing less than the removal of the Indians from the State would serve to quiet the disturbance. The Indian agents attempted to allay the storm, but the populace took offense at their stand in the matter, and in April, 1859, attempted to force their instant resignation. Finally, on the 23d of May, two hundred and fifty armed men, headed by Captain Baylor, an ex-agent, threatened the Brazos Reservation with immediate attack, but Captain Plummer, of the First Infantry, interposed, and forced Baylor to withdraw, though not until several Indians and one or two whites had been killed or wounded. Affairs having reached this pass, the Government, upon representations made by the Indian agents, instructed that the Indians should be removed north of Red River as soon as their growing crops were ripened and gathered, but the citizens of the State would not consent to this delay, and Supervising Agent R. S. Neighbors, at his own request, was permitted to make the removal at once. A large detachment of troops was required to guard the Indians during their continuance on Texan soil, but on the 1st day of August the last member of these persecuted colonies passed over Red River beyond the limits of the State, and were eventually located on the Washita. The number of Indians thus removed was 1,415, of whom 380 were Comanches. They lost everything that their industry had gained them, and were not even allowed to gather their cattle. The enmity incurred by Superintendent Neighbors, through his championing the cause of his charges, cost him his life some weeks later. Incautiously returning to Texas, he was waylaid and shot by an unknown party. No further attempts were made to colonize Indians within the boundaries of Texas. A remnant of the Tonkawas, whose fidelity to the whites was beyond doubt, was allowed to linger in the vicinity of Fort Griffin for a time, and the last of the Alabamas are still located on the Trinity River, in Polk County, but the members of that tribe now number but a little over two hundred, all told, and they have largely adopted the manner of life of their civilized neighbors.

As though to prove the falsity of the suspicions that had caused the removal of the reservation Indians, the autumn following was marked by the commission of many atrocities throughout the counties adjoining that in which they had been located. In the month of December, a band of red marauders raided through the northern portion of Parker County, and their path, throughout its course, was marked with blood. Two settlers, named Brown and Sherman, had chosen locations on Rock Creek, near the Palo Pinto County line, and some twelve or fifteen miles from the present town of Weatherford, then, as now, the county seat. The homes of the two families were some three or four miles apart, near enough to be neighbors, but too widely separated for common defense or protection in case of trouble. Brown was the first white man encountered by the Indians on this raid. He was searching for his horses, a few hundred yards from his house, and, being unarmed, could make no defense. He was killed with arrows and spears, scalped, and left lying on the blood-stained earth, while the Indians hastened to his house to proceed in their work of butchery. Fortunately, Mrs. Brown discovered their approach and closed and barred the door, thus saving her life, as the Indians seldom ventured to force an entrance unless they knew the premises were entirely without defenders. Rounding up Brown's horses, the savages proceeded to Sherman's house, gathering other horses by the way until they had secured between twenty-five and thirty head, and in the meantime they were joined by other parties, increasing their force to about fifty-five or sixty. Sherman's family was at the table when the Indians approached, and they were taken so completely by surprise that an attempt at defense would have been useless. Besides there was a chance that the Indians were friendly, and this supposition seemed to be corroborated by their actions. Alighting from their ponies, they entered the house, shaking hands with its inmates, but after assuring the family of their friendliness, they ordered the house at once vacated, still assuring Sherman that no harm would be done him or his. As entreaties would have been of as little avail as an attempt at resistance, Sherman started with his wife and family at once, through the rain, but a half mile from the house they were overtaken by a portion of the band who insisted that Mrs. Sherman should return with them. The pleadings of the husband and children awakened no response save outbursts of mirth, and finally the poor woman was torn from her husband's arms, carried screaming back to the house, and after being subjected to all imaginable torture and brutal treatment, she was stripped of every thread of clothing, pierced through the body with several arrows, and then, as a crowning act of needless cruelty, two mounted Indians caught her hands and

urged their horses to their best speed, while a third followed with a long pole, beating the almost lifeless woman in the back. At last she was allowed to sink to the ground, and after the scalp was torn from her head, the savages took their departure. Though left for dead, Mrs. Sherman still had strength to crawl within the house, where she was found soon after by a relief party led by her husband. She lived to tell the story of the indignities she had suffered, and to tell her dear ones good-by, but four days later she sunk beneath her many injuries, passing to a land wherein no cowardly assassin may enter.

Awakened from fancied security by tidings of this raid, the border settlers found themselves threatened with danger on every hand. In Jack County the Indians stole two children of a Mrs. Calhoun, but were pursued by a party of neighbors, and the children recovered after a chase of nearly fifty miles. The house of Calvin Gage was attacked, Mrs. Gage and her infant, and Mrs. Saunders, her mother, were killed, and a son and two daughters taken prisoners. After carrying the boy some miles on their retreat, the Indians killed him, and then stripped the two girls and turned them at liberty to escape from the wilderness as best they might. Perfectly nude, and exposed to the inclemencies of the weather, and without food, these two girls wandered through the wooded hills and valleys of the "Upper Cross Timbers" for two days and nights, and were nearly dead from hunger and exposure when, on the morning of the third day they succeeded in reaching the settlements. The Cameron and Mason massacre, which is described at some length in the biography of one of the early settlers of Jack County, also occurred in that county during the spring of 1859. Cameron and his wife and two sons were killed, as were also Mr. and Mrs. Mason, their neighbors, while one child was carried away by the murderers, leaving a little girl of six and a baby of two years to linger, weeping with fear and hunger, by the decaying bodies of their parents, until they were discovered by a man who chanced to be passing. The stolen child was recaptured from the Indians by a party of travelers who chanced to meet them on their retreat, the murderers escaping a well-deserved punishment by scattering in flight. While these bloody scenes were being enacted among the northern hills, marauding bands were sweeping through the settlements farther to the southward. In Hood, Burnet and Bell Counties the arrow and scalping knife were playing their accustomed parts in a series of border tragedies, and the hardy settlers of Llano and Uvalde Counties were receiving their first lessons in the horrors of Indian warfare. Apparently the savages had learned the futility of attempting to make an organized resistance to the advance of the all-conquering whites, but had, instead, adopted the policy of crushing out the intruders one by one, invariably working in small bands, and striking their deadly blows with cowardly stealth that forbade to the settler all possibility of defense. Still, with all their cruelty and bloodthirstiness, the Indians were not waging a war of extermination, for members of nearly every family that fell in their power were allowed to escape uninjured. Their merciful and murderous moods were alike erratic, and they would slay and spare in the same instant. When Mrs. Sherman was tortured to death, why were the husband and children allowed to escape? Why were the younger Cameron children spared; and the two Gage girls? Another instance illustrating this incomprehensible trait of the savage nature occurred during the spring of 1859 in Bell County. A Mr. and Mrs. Riggs were killed, as was also a Mr. Pierce who resided with them; but a helpless babe was left uninjured, crawling about in the blood of its murdered mother. Two young daughters of Mr. Riggs were carried away as prisoners, but both managed to escape later on, jumping from the horses that carried them while the Indians were riding at full speed to evade discovery by some cow hunters. Both could have been killed and scalped without costing the band any material delay, and the fact that they were not, shows that the savage thirst for blood had been momentarily satiated.

In 1860, Captain "Sul." Ross, who had already distinguished himself in the expeditions against the Comanches, was commissioned by the governor to organize a company of sixty men and take the field against the predatory redskins. This force was stationed at Fort Belknap on the upper Brazos, Colonel Johnson's regiment which had formerly occupied that post having recently been disbanded. It was high time for some competent leader to take the field, for the murders of the preceding year had been duplicated, and the attempts at reprisal made by the Texans had accomplished but little good. The early part of the year had witnessed two engagements worthy of a passing notice. During the month of June, the Browning brothers were attacked by the Indians near their home on the Clear Fork,

and one killed, while the other escaped through the speed of his horse, though severely wounded. General Baylor chanced to be in the vicinity, accompanied by his brother and two sons, and hearing of the murder of Browning, the party hastened to the Browning ranch, where other citizens had assembled. General Baylor, George Baylor, his brother, and three others named Hale, Wright and Dawson, took the trail of the Indians, and five days later overtook them on Paint Creek in Stephens County. In the fight that followed, thirteen of the Indians were killed, and not one of the whites injured. Baylor's party returned to Weatherford with the trophies of their victory, including the scalps of nine of the enemy, and the scalp of a white woman, which one of the savages had worn at his belt. The following description of the welcome accorded them (taken from a work published in 1877) will give the reader a good idea of the prevailing bitterness of feeling then prevailing against the Indians: "The excitement was very great. The news of Baylor's success extended to the adjoining counties, and the heroic men were honored by a public barbecue on the square, which was participated in by several hundred people. Speeches were made and general rejoicings were universal. In the evening of the day a dance was indulged in at the court house, which was kept up until 'broad day light' the following morning. In the long room a rope was stretched diagonally across, and on it were hung the nine Indian scalps, the woman's scalp captured from the defunct Comanches, and all the trophies of the expedition. In the excitement incident to the glorification, those who participated in it evidently forgot that the prominent decorations of the hall were the unmistakable evidences of death and murder." General Baylor exhibited his trophies in other towns of the State, and as a result of the interest they awakened, supplies of provisions, clothing and arms, were forwarded to Weatherford to be distributed among the needy settlers on the frontier. General Baylor came again into prominence a few months later by organizing a grand buffalo hunt, in which all the young men of the country were invited to join. As this was about the time of the outbreak of hostilities between the North and South, many people believed that it was his intention to capture some one of the government posts on the upper Brazos, but he attempted nothing of the kind. The expedition proved a "grand buffalo hunt" as its originator intended, but while the party was resting at Camp Cooper on their return, the Indians made a descent upon their horse herd, running off every hoof they possessed. Most of the horses were shortly recaptured by Colonel Dalrymple of the rangers, after a running fight of twelve miles, in which two Indians were killed, and the remounted hunters reached the settlements in safety.

The second encounter with the Comanches marking the annals of that year, occurred on Wolf Creek, one of the upper tributaries of the Colorado. A company under the command of Captain Jack Cureton, had ventured out into the Staked Plains in search of the enemy, going by way of the Double Mountain Fork. They found game very scarce, and their stock of provisions was soon exhausted, but they pressed on, and were eventually rewarded by discovering an Indian trail, which was followed until the Comanche camp was located. Discovering their danger, the Indians commenced to retreat, but the Texans charged down upon them, killing quite a number at the first fire. Those who survived the deadly discharge sought concealment in the bushes and tall grass along the stream, but were hunted from their hiding places and killed, only one of their number escaping. One Texan was mortally wounded, dying a few days later.

When Captain Ross was given the command at Fort Belknap, it was with the expectation that he would promptly begin offensive operations against his old antagonist, Peta Nocona, who still held full sway over the northern Comanches, and was directing his braves in their incessant warfare upon the whites. Ross was not the man to keep the people long in expectancy. Some time was, of course, required to perfect his plans and get his men in readiness for a long and dangerous campaign, but he hurried through his preparations as rapidly as possible, and, as he could take but forty men from his post, requested assistance from Captain Evans, in command of the United States troops at Camp Cooper. A sergeant and twenty men were sent him, and he was also joined by a force of seventy volunteers from the settlements, led by Captain Jack Cureton. Early in December the command took the field and marched for the enemy's country, carrying with them, upon pack mules, ample provisions for an extended expedition. From indications noted by Captain Ross while marching up Pease River, he believed that the principal Comanche village was not far distant, and while reconnoitering in person, in the advance of his command, he suddenly found himself within two hundred yards of the lodges,

grouped in a valley, beside a small stream. The Comanches were evidently making preparations for a removal, and by the time Ross' men had reached him in compliance to his signals, the entire force of the enemy were mounted and had started to leave the valley. Ross' force at the moment consisted only of his own troop, forty strong, and the twenty-one troopers from the Second Cavalry, the volunteers, under Captain Cureton, being so far in the rear that it was useless to think of awaiting their coming. The detachment of cavalry was sent around a chain of hills to attack the Indians in the rear, and then, with his forty men, Captain Ross charged down upon the frightened savages, killing many of them before they could attempt either flight or defense. Those who attempted to escape ran directly toward the charging cavalrymen, and were hurled back into the very thick of the fight. Captain Ross, in his description of the fight, speaks of the closing scenes as follows:

"The chief of the party, Peta Nocona, a noted warrior of great repute, with a young girl about fifteen years old mounted on his horse behind him, and Cynthia Ann Parker, with a girl child about two years of age in her arms, and mounted on a fleet pony, fled together, while Lieutenant Tom Killiheir and I pursued them. After running about a mile, Killiheir ran up by the side of Cynthia's horse, and I was in the act of shooting, when she held up her child and stopped. I kept on after the chief, and about half a mile further, when in about twenty yards of him, I fired my pistol, striking the girl (whom I supposed to be a man, as she rode like one, and only her head was visible above the buffalo robe with which she was wrapped) near the heart, killing her instantly, and the same ball would have killed both but for the shield of the chief, which hung down, covering his back. When the girl fell from the horse she pulled him off also, but he caught on his feet, and before steadying himself, my horse, running at full speed, was very nearly upon top of him, when he was struck with an arrow which caused him to fall to pitching or 'bucking,' and it was with great difficulty that I kept my saddle, and in the meantime narrowly escaped several arrows coming in quick succession from the chief's bow. Being at such a disadvantage, he would have killed me in a few minutes, but for a random shot from my pistol (while I was clinging with my left hand to the pommel of my saddle), which broke his right arm at the elbow, completely disabling him. My horse then became quiet, and I shot the chief twice through the body, whereupon he deliberately walked to a small tree, the only one in sight, and leaning against it, began to sing a wild, wierd song. At this time my Mexican servant, who had once been a captive with the Comanches, and spoke their language fluently as his mother tongue, came up, in company with two of my men. I then summoned the chief to surrender, but he promptly treated every overture with contempt, and signalized this declaration with a savage attempt to thrust me with his lance, which he held in his left hand. I could only look upon him with pity and admiration; for, deplorable as was his situation, with no chance of escape, his party utterly destroyed, his wife and child captured in his sight, he was undaunted by the fate that awaited him. As he seemed to prefer death to life, I directed the Mexican to end his misery by a charge of buck shot from the gun which he carried. Taking up his accouterments, which I subsequently sent to Governor Houston, to be deposited in the archives in Austin, we rode back to Cynthia Ann and Killiheir, and found him bitterly cursing himself for having run his pet horse so hard after an 'old squaw.' She was very dirty, both in her scanty garments and person. But as soon as I looked her in the face, I said, 'Why, Tom, this is a white woman; Indians do not have blue eyes.'"

Though twenty-four years had passed since her capture at Parker Fort, Cynthia Ann could remember and describe the tragic circumstances that occurred there with such clearness that her identity could not well be doubted. Soon after the return of the command to Fort Belknap, she was sent with her child to Camp Cooper, where she was tenderly cared for by the ladies resident there; and her uncle, Colonel Isaac Parker, shortly visited her. She had forgotten every word of the English language, but, when interrogated through the Mexican interpreter, gave replies which satisfied every one that the long lost daughter of Silas Parker had really been recovered; and when the name "Cynthia Ann" was spoken in her hearing, she repeated it over and over, with a smile that told of awakening memory. She was welcomed gladly to the home of her relatives, but for a time a close watch was required to prevent her escape; her heart seeming bent upon a return to the wilds where her savage lord lay buried, and her two eldest children were learning the arts of savage warfare. At length she seemed to become resigned to her changed surroundings, and readily learned many of the ways and

duties of domestic life, but her thoughts were still of her children, and she looked forward hopefully for a time of peace when she might meet her sons again and reclaim them from their savage life. Death claimed her before her hopes could be realized. Her little daughter died in 1864, and a short time later she was laid at rest by her side. The two sons of Peta Nocona and Cynthia Ann took part in the Pease River fight, but both escaped the fate that overwhelmed their savage but warlike father. They were among the few warriors who made their way in safety from the battlefield and joined the throng of squaws and children in their flight towards the Comanche villages on the headwaters of the Arkansas River. One of them died some years later on the plains, while the other, Quanah Parker, still lives, one of the most prominent chiefs of the once great tribe of Comanches.

The death of Peta Nocona and the destruction of his band was welcome news to the inhabitants of the exposed settlements along the northwestern border, and it was indeed fortunate that Ross' expedition had been so well timed. The civil war was at hand, and during those dark days to follow, when the troops were withdrawn from the frontier and the attention of the country was too closely fastened upon the great struggle to take note of the minor hardships of border life, the presence of such a neighbor as the ruthless Comanche chief would have presaged continual danger and bloodshed. Even with this enemy removed, the settlers were still perpetually annoyed by the depredations of wandering bands, and murders continued to be of frequent occurrence. Early in the spring of 1861 a band of Comanches ventured into Jack County and attacked a party of rangers who were on a scout, and had stopped for their noonday meal some twelve miles north of Jacksboro. The Indians were repulsed with the loss of one of their number, and the rangers pursued them during the afternoon and the succeeding night, but were not able to again overtake them. Bearing south into Parker County, the Comanches, on the following day, encountered and killed William Youngblood, who was splitting rails near his house. Reinforced by a number of settlers, the rangers continued on their trail, overhauled them after a long chase and killed their leader, recovering Youngblood's scalp, which he carried at his girdle, and returning with it in time to see it replaced on the murdered man's head just before he was lowered into his grave. During the same summer, John Killen and William Washington, two cowboys, were attacked on Grindstone Creek, and the former was killed; Washington escaping though badly wounded. Mrs. Brown, who resided on Grindstone Creek, was killed by the same band of marauders, but her infant child was spared. In 1862 the raids through Parker County were repeated, Marion Tacket, a stockman, was killed, and ten members of the Stovall and Matthews families were carried into captivity, but were released two years later by a treaty made with the Comanches by the United States Government, being at that time held by their captors in Kansas, several hundred miles distant from their home.

But the settlements along the upper Brazos were not the only ones visited by the savages during the years mentioned. Taking advantage of the disturbed condition of affairs, and the almost entire absence of organized means of defense, the Comanches had once again started on the warpath in earnest, choosing the routes followed by their predatory bands in 1859. One of the most horrible tragedies in the history of Eastland County was enacted in the month of January, 1861, the victims being the Lemley sisters, four in all, though the eldest had married and was then a Mrs. Woods. While at their home together, and without protection, they were captured by a number of Indians and submitted to the most revolting treatment, and then were ordered to accompany their captors at their departure. Mrs. Woods and another of the sisters attempted to escape, but were easily overtaken, killed and scalped. The same fate would have befallen the remaining sisters, but they besought protection from the oldest Indian in the band, and he dissuaded his companions from their purpose. The sisters were dragged from their home, however, and carried into Erath County, near Stephensville, where they were stripped of all their clothing and left there, naked, in midwinter, to wander through an unknown region in search of shelter. They finally reached the home of a settler and were furnished clothing, but it was many weeks before they recovered from the effects of the abuse and exposure they had undergone. Meanwhile the Indians were continuing their murderous work. A party of four men —Chrisman, Latham, Saunders and Gallagher—on their way from Camp Cooper to Gatesville, were attacked between Pecan Bayou and Blanket Creek, in Brown County, by a party of Indians, who were driving a *caballada* of stolen horses, but by presenting a bold front they succeeded in repulsing their assailants, and killed one of their number, also recapturing the stolen stock. About a month later

another party of horse thieves fared a similar fate at the hands of the rangers, but it was not long before the redskins took a dire revenge for their losses. Three families had arranged to meet and enjoy a picnic, gathering nuts in Pecan Bayou bottom. The family of Moses Jackson failed to come as arranged, search was instituted the following day, and the cause of their absence soon explained. Jackson's wagon was found standing in the road some distance from the appointed rendezvous, and in it lay his body and those of his two youngest children. A short distance from the wagon lay the bodies of his wife and fourteen-year-old daughter. Jackson had been shot, but the throats of all the others had been cut, showing the crime had been committed deliberately and with a view to making the least possible amount of noise. Two other children—a boy of eleven and a little girl of nine years—had been carried away as captives. A party was raised for pursuit in all possible haste, but as thirty-six hours had elapsed before the massacre was discovered, there was little hopes of overhauling the murderers. Still, the pursuit was continued for several days, and finally the lost children were encountered coming back along the trail. Left by their captors in the woods and told to await their return, the children had preferred risking the unknown dangers of the wilderness to continuing longer with the murderers of their parents, and had pluckily set out on their return. They were nearly exhausted through lack of food, but both recovered their strength and activity, the girl marrying and settling in Lampasas County, where she probably still resides. The shock of the tragedy proved too much for the boy, however. His mind was shattered, and he became a mere mental wreck, continually wandering over the country and conversing only of the bloody scene he had witnessed.

The spring of 1863 saw the greater number of the sons of Texas arrayed under the banner of the Confederacy; but owing to the urgent need of frontier protection, the men of the border counties were formed into companies of home guards for defense against the Indians. By perusal of the biographical portion of this work, it will be found that many of the subjects were members of such organizations, and their varied experiences are interesting to the highest degree. Without the protection afforded by these companies, the depopulation of the western and northwestern counties would have been a question of only a few months time, and as it was, many settlements on the extreme border were eventually abandoned, their inhabitants seeking safety in more thickly populated regions. Though constantly on the move, the rangers were not ubiquitous, and the Indians soon learned to watch their movements; often striking at localities from which their protection had just been removed. Hardly a week passed without news of Indian deviltry from some portion of the country, while at times it seemed that all the tribes of the West were leagued against the Texans and had made a combined assault upon their entire frontier. At such times of need, nothing save an unlimited supply of persistence and nerve can avail, and in neither of these qualities were the Texans of that—or any other—day found deficient. What they lacked in numbers was made up in unadulterated pluck and dash, and that all-conquering self-confidence which taught them that one well-armed cowboy was worth a half dozen Indians, regardless of time, place or attendant circumstances. Many changes had come about since the early colonists first encountered in battle the original owners of the country, but the greatest of all was in the temper and composition of the Texans themselves; and particularly of those whom, by their residence on the frontier, were most frequently called upon to withstand their red foemen. They were no longer peace-loving colonists, fresh from the quiet law-abiding States, shunning an encounter until surrounded and shot down in their own homes or fields; but, instead, we find them, almost from their cradles, trained in the use of arms, and filled with a stern, unrelentless hatred for the painted, half-naked fiends to whom they owed the loss of friends and relatives without number. Instead of evading their savage enemy, their eyes were ever on the alert for indications of his presence, and the discovery of an Indian trail would arouse the men of an entire neighborhood to prompt pursuit.

However, in spite of all this vigilance, the wily Comanches were not to be thwarted in their quest of scalps and horses. Pursuing the policy of former years, they haunted the settlements in small bands, and the defenseless whites, who were so unfortunate as to fall into their hands, invariably paid the penalty with their lives. Such was the fate of William and Stewart Hamilton, of Mrs. F. C. Brown and her daughter, of Mrs. Jane Smith, of William Berry, Henry Maxwell and Hugh Blackwell, all of Parker County; of Peveler, McCoy and Cox, of Young County; of Baker, Peters and Welty, of Palo Pinto; Rogers, of Erath; Williamson, of Coryell; Green, of Hood; the Joy family, of Kerr; Jackson,

of Blanco, and Owen Lindsey, of San Saba. All of these tragedies, with many others, marked the last three years of the war, and we will spare our readers a perusal of their ghastly particulars. From their exposed position the northwestern counties suffered the most severely. About thirty families from the upper Brazos gathered, for common protection, at a point some eight miles from Fort Belknap, erecting a fortification of pickets which they dignified by the name of Fort Murray. A band of nearly one thousand Indians swept the country in the vicinity, but did not venture upon an attack, and eventually divided into small parties and scattered through the adjoining counties. Judge Harmison and his son Perry were "rounded up," in a little motte of timber, by sixty Comanches, but being provided with breech-loading rifles, succeeded in standing them off, until the sound of firing in another quarter drew their assailants away. The diversion was caused by an attack upon a settler, named Myers, who was killed and mutilated in a shocking manner. Several families who had not sought shelter at Fort Murray, were attacked and a number of their members killed. The surrounding country was swept clear of cattle, and the settlers, warned of the danger to which they were exposed, deserted their homes and fled farther east. The counties of Stephens, Palo Pinto, Jack, Wise and Montague were almost entirely abandoned, and in Clay County not a living soul remained. Prompted by the example set them by the Comanches, the Kickapoos, in full force, swept through the Clear Fork country, near Fort Phantom Hill, and committed so many depredations that all the available forces of the frontier were brought forward to meet them. One hundred and ten men from the nearest Confederate post, under Captain Fossett, and a militia force numbering something over three hundred, and commanded by Captain Totten, of Bosque County, overtook the Indians and forced them to a combat on Dove Creek, west of the Colorado. The Kickapoos, with refugees from other tribes, numbered something like nine hundred men, and they had the advantage of position, having made their stand in a dense thicket, protected on one side by a deep ravine, and on the other by the Dove Creek bluffs, while the Texans had to approach over the open prairie exposed to a galling fire. By a sudden dash Captain Fossett captured nearly all the Indians' horses, while Captain Totten, with his militia, charged the thicket. But no force of men could withstand the murderous fire that was poured into their ranks. They were forced back and thrown into confusion, and most of the officers and the front ranks in the advance were killed before they could retreat from the thicket. The Indians were following up their advantage, when Captain Fossett circled the thicket, and charged through the entire length of the village it protected, firing at every Indian in sight. Attracted by the attack upon their lodges, the Indians dashed in that direction, and their coming was so prompt that the Confederates were not given time to reload, and they were compelled to retreat under a heavy fire. The victory rested with the Indians, for Captain Fossett was compelled to relinquish all but three hundred of the captured horses, and the Kickapoos were left in possession of the field, but profited by the first opportunity to flee across the Rio Grande into Mexico, leaving their dead and camp equipage behind them. The loss on the two sides was about equal. Fifty whites were buried on the battle ground.

At the close of the Civil War the entire Northwestern frontier was lying a desolate waste, nearly all the settlements having been vacated, while the ranges were bare of cattle, and given up as the grazing grounds of the buffalo and antelope. But in the eyes of men who had passed through four years of continual warfare this was a state of affairs which could not be allowed to continue. After braving the charges of Sheridan and Custer, and resisting Grant's slow but certain advance, they were not inclined to attach much importance to the danger of Indian interference, while the growing importance of the cattle industry drew them irresistibly to the westward. The border warfare was again to assume a new character. The cowboy spirit was more prominently than ever in the ascendency, and the cowboys of that day were the hardy campaigners of but yesterday, as it were; as reckless and daring a set of men as were ever intrusted with the protection of a threatened frontier. Small wonder that their savage enemies grew to appreciate their prowess; or that their own self-confidence grew upon finding that a dozen Comanches or Kiowas would hesitate to charge a single Henry or Spencer rifle when a cool gray or blue eye was glancing along its polished barrel. There was much of dash and bravado in the cowboy's courage, but it was soundly based, and can hardly be cavilled at. They were men fully cognizant of the dangers braved, and if they cared to make a jest of peril, they were calm and stern enough when the critical moment came. Still, the careless, devil-may-care spirit, cultivated amid the stirring scenes

of the recently ended war, was ever present, and its out-croppings in the times of greatest danger gave rise to many typical anecdotes that are still current on the frontier.

For instance: A cowboy employed on one of the first ranches established in Shackelford County, ventured out unarmed one day to brand a young calf known to be with its mother in a bend of the creek near camp. He had accomplished his mission, and was mounting his horse to return, when a single Indian fired upon him from the shelter of a neighboring bush. Without giving the savage time to reload his piece, our cowboy, whose name is unfortunately forgotten, charged down upon him with a yell, forced him out upon the open prairie, and with a deft cast of his lariat encircled his body, and dragged him, helpless and silent, back to the branding fire. As coolly and deliberately as though he was going about his every-day business, the Texan replaced the brand in the fire, brought it to the proper heat, and applied it with quiet decision to the most prominent part of his enemy's anatomy; then stooped, and, with the Indian's own knife, added the ranch ear-mark as corroborative evidence of the

A COWBOY'S FUNERAL

authenticity of the brand. Then he loosened the rope and kicked the Indian until he sullenly arose to his feet.

"There, you can go now," remarked the Texan, "and the next time some feller calls you a maverick, you tell him for me that he's a liar. And tell your folks, when you see 'em, that when grass rises next spring I'm going to round-up and brand the whole d——d tribe."
